Global reductions time per iteration:             0.000 sec (0.0%)
Message count per iteration:                        801 messages
Data transfer per iteration:                      9.585 MB
LE solves per iteration:                            12 solves
LE wall-clock time per iteration:                 2.445 sec (49.9%)
LE global solves per iteration:                     27 solves
LE global wall-clock time per iteration:          0.246 sec (5.0%)
AMG cycles per iteration:                           64 cycles
Relaxation sweeps per iteration:                  4160 sweeps
Relaxation exchanges per iteration:                 920 exchanges

Total wall-clock time:                            4.901 sec
Total CPU time:                                  17.030 sec
```

A description of the parallel statistics is as follows:

- `Average wall-clock time per iteration` describes the average real (wall clock) time per iteration.
- `Global reductions per iteration` describes the number of global reduction operations (such as variable summations over all processes). This requires communication among all processes.

  A global reduction is a collective operation over all processes for the given job that reduces a vector quantity (the length given by the number of processes or nodes) to a scalar quantity (e.g., taking the sum or maximum of a particular quantity). The number of global reductions cannot be calculated from any other readily known quantities. The number is generally dependent on the algorithm being used and the problem being solved.
- `Global reductions time per iteration` describes the time per iteration for the global reduction operations.
- `Message count per iteration` describes the number of messages sent between all processes per iteration. This is important with regard to communication latency, especially on high-latency interconnnects.

  A message is defined as a single point-to-point, send-and-receive operation between any two processes. This excludes global, collective operations such as global reductions. In terms of domain decomposition, a message is passed from the process governing one subdomain to a process governing another (usually adjacent) subdomain.

  The message count per iteration is usually dependent on the algorithm being used and the problem being solved. The message count and the number of messages that are reported are totals for all processors.

  The message count provides some insight into the impact of communication latency on parallel performance. A higher message count indicates that the parallel performance may be more adversely affected if a high-latency interconnect is being used. Ethernet has a higher latency than Myrinet or Infiniband. Thus, a high message count will more adversely affect performance with Ethernet than with Infiniband.

  To check the latency of the overall cluster interconnect, refer to *Checking Latency and Bandwidth* (p. 1628).
- `Data transfer per iteration` describes the amount of data communicated between processors per iteration. This is important with respect to interconnect bandwidth.

  Data transfer per iteration is usually dependent on the algorithm being used and the problem being solved. This number generally increases with increases in problem size, number of partitions, and physics complexity.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The data transfer per iteration may provide some insight into the impact of communication bandwidth (speed) on parallel performance. The precise impact is often difficult to quantify because it is dependent on many things including: ratio of data transfer to calculations, and ratio of communication bandwidth to CPU speed. The unit of data transfer is a byte.

To check the bandwidth of the overall cluster interconnect, refer to *Checking Latency and Bandwidth* (p. 1628).

- `LE solves per iteration`describes the number of linear systems being solved per iteration. This number is dependent on the physics (non-reacting versus reacting flow) and the algorithms (pressure-based versus density-based solver), but is independent of mesh size. For the pressure-based solver, this is usually the number of transport equations being solved (mass, momentum, energy, etc.).
- `LE wall-clock time per iteration` describes the time (wall-clock) spent doing linear equation solvers (i.e., multigrid).
- `LE global solves per iteration` describes the number of solutions on the coarse level of the AMG solver where the entire linear system has been pushed to a single processor (`n0`). The system is pushed to a single processor to reduce the computation time during the solution on that level. Scaling generally is not adversely affected because the number of unknowns is small on the coarser levels.
- `LE global wall-clock time per iteration` describes the time (wall-clock) per iteration for the linear equation global solutions.
- `AMG cycles per iteration` describes the average number of multigrid cycles (V, W, flexible, etc.) per iteration.
- `Relaxation sweeps per iteration` describes the number of relaxation sweeps (or iterative solutions) on all levels for all equations per iteration. A relaxation sweep is usually one iteration of Gauss-Siedel or ILU.
- `Relaxation exchanges per iteration` describes the number of solution communications between processors during the relaxation process in AMG. This number may be less than the number of sweeps because of shifting the linear system on coarser levels to a single node/process.
- `Time-step updates per iteration` describes the number of sub-iterations on the time step per iteration.
- `Time-step wall-clock time per iteration` describes the time per sub-iteration.
- `Total wall-clock time` describes the total wall-clock time.
- `Total CPU time` describes the total CPU time used by all processes. This does not include any wait time for load imbalances or for communications (other than packing and unpacking local buffers).

The most relevant quantity is the `Total wall clock time`. This quantity can be used to gauge the parallel performance (speedup and efficiency) by comparing this quantity to that from the serial analysis (the command line should contain `-t1` in order to obtain the statistics from a serial analysis). In lieu of a serial analysis, an approximation of parallel speedup may be found in the ratio of `Total CPU time` to `Total wall clock time`.

34.8.1.1. Checking Latency and Bandwidth

You can check the latency and bandwidth of the overall cluster interconnect, to help identify any issues affecting ANSYS FLUENT scalability, by using the **Parallel/Network/Show Latency...** and **Parallel/Network/Show Bandwidth...** menu items.

Parallel → **Network** → **Show Latency...**

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Depending on the number of machines and processors being used, a table containing information about the communication speed for each node will be displayed in the console. The table will also summarize the minimum and maximum latency between two nodes.

Consider the following example when checking for latency:

```
Latency (usec) with 1000 samples [1.83128 sec]
 ----------------------------------------
 ID       n0     n1     n2    n3    n4    n5
 ----------------------------------------
 n0            48.0   48.2  48.2  48.3   *50
 n1    48.0           48.2  48.3  48.3   *48
 n2    48.2    48.2         48.8  49.1   *53
 n3    48.2    48.3    *49        48.6  48.5
 n4    48.3    48.3   49.1  48.6         *50
 n5    49.7    48.5    *53  48.5  49.7

 ----------------------------------------
 Min: 47.9956 [n0<-->n1]
 Max: 52.6836 [n5<-->n2]
 ----------------------------------------
```

Important

In the above table, (*) is the maximum value in that row. The smaller the latency, the better.

Six processors (n0 to n5) are spawned. The latency between n0 and n1 is 48.0 μs. Similarly, the latency between n1 and n2 is 48.2 μs. The minimum latency occurs between n0 and n1 and the maximum latency occurs between n2 and n5, as noted in the table. Checking the latency is particularly useful when you are not seeing expected speedup on a cluster.

Parallel $\rightarrow$ Network $\rightarrow$ **Show Bandwidth...**

In addition to checking for latency, you can check your bandwidth. A table containing information about the amount of data communicated within one second between two nodes is displayed in the console. The table will also summarize the minimum and maximum bandwidth between two nodes.

Consider the following example when checking for bandwidth:

```
Bandwidth (MB/s) with 5 messages of size 4MB [4.36388 sec]
 ----------------------------------------
 ID      n0     n1     n2     n3     n4     n5
 ----------------------------------------
 n0          111.8    *55  111.8   97.5  101.3
 n1   111.8          69.2   98.7  111.7    *51
 n2    54.7   69.2          72.9  104.8    *45
 n3   111.8   98.7   72.9          64.0    *45
 n4    97.6  111.7  104.8    *64          76.9
 n5   101.2   50.9   45.5    *45    76.9

 ----------------------------------------
 Min: 45.1039 [n5<-->n3]
 Max: 111.847 [n0<-->n3]
 ----------------------------------------
```

Important

In the above table, (*) is the minimum value in that row. The larger the bandwidth, the better.

The bandwidth between n0 and n1 is 111.8 MB/s. Similarly, the bandwidth between n1 and n2 is 69.2 MB/s. The minimum amount of bandwidth occurs between n3 and n5 and the maximum occurs between n0 and

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

n3, as noted in the table. Checking the bandwidth is particularly useful when you cannot see good scalability with relatively large cases.

34.8.2. Optimizing the Parallel Solver

34.8.2.1. Increasing the Report Interval

In ANSYS FLUENT, you can reduce communication and improve parallel performance by increasing the report interval for residual printing/plotting or other solution monitoring reports. You can modify the value for **Reporting Interval** in the *Run Calculation Task Page* (p. 1955).

Run Calculation → **Calculate...**

Important

Note that you will be unable to interrupt iterations until the end of each report interval.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

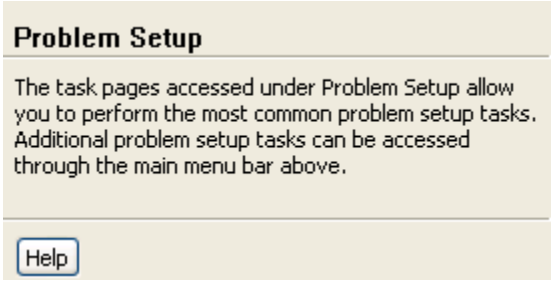
Chapter 35: Task Page Reference Guide

This reference guide provides information about the task pages in FLUENT.

35.1. Problem Setup Task Page
35.2. General Task Page
35.3. Models Task Page
35.4. Materials Task Page
35.5. Phases Task Page
35.6. Cell Zone Conditions Task Page
35.7. Boundary Conditions Task Page
35.8. Mesh Interfaces Task Page
35.9. Dynamic Mesh Task Page
35.10. Reference Values Task Page
35.11. Solution Task Page
35.12. Solution Methods Task Page
35.13. Solution Controls Task Page
35.14. Monitors Task Page
35.15. Solution Initialization Task Page
35.16. Calculation Activities Task Page
35.17. Run Calculation Task Page
35.18. Results Task Page
35.19. Graphics and Animations Task Page
35.20. Plots Task Page
35.21. Reports Task Page

35.1. Problem Setup Task Page

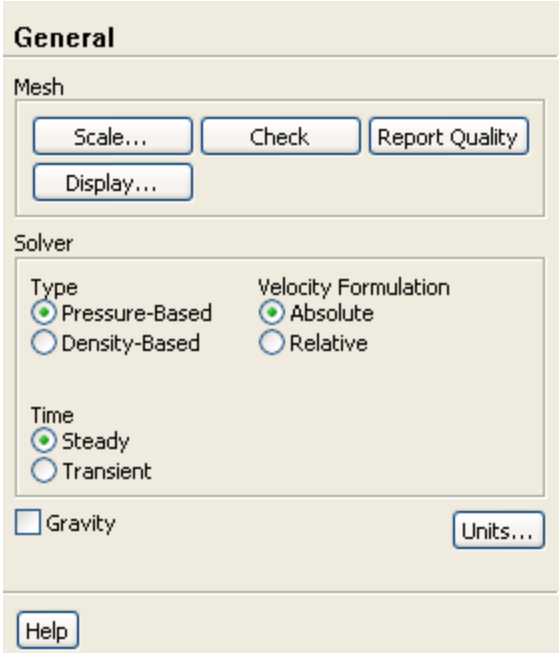
The **Problem Setup** task page introduces you to the main tasks involved in setting up your CFD simulation using ANSYS FLUENT.



35.2. General Task Page

The **General** task page allows you to set various generic problem settings, such as those related to the mesh or the solver.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Mesh

contains controls relating to mesh settings.

Scale...

opens the *Scale Mesh Dialog Box* (p. 1634).

Check

verifies the validity of the mesh. The check provides volume statistics, mesh topology and periodic boundary information, verification of simplex counters, and verification of node position with reference to the x axis for axisymmetric cases. See *Checking the Mesh* (p. 172) for details.

It is recommended that you check the mesh right after reading it into the solver, in order to detect any mesh trouble before you get started with the problem setup.

Report Quality

displays various quantities related to the quality of the mesh in the console, such as `Minimum Orthogonal Quality` and `Maximum Aspect Ratio`. See *Mesh Quality* (p. 144) for details.

Display...

opens the *Mesh Display Dialog Box* (p. 1635).

Solver

contains controls relating to solver settings.

Type

contains the solution methods available for computing a solution for your model. See *Using the Solver* (p. 1207) for details.

Pressure-Based

enables the pressure-based Navier-Stokes solution algorithm (the default).

Density-Based

enables the density-based Navier-Stokes coupled solution algorithm.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Velocity Formulation

specifies the velocity formulation to be used in the calculation. See *Choosing the Relative or Absolute Velocity Formulation* (p. 518) for details.

Absolute

enables the use of the absolute velocity formulation. This is the default setting.

Relative

enables the use of the relative velocity formulation. This option is available only with the **Pressure-Based** solver.

Time

contains options related to time dependence.

Steady

specifies that a steady flow is being solved.

Transient

enables a time-dependent solution. See *Performing Time-Dependent Calculations* (p. 1255) for details.

2D Space

contains options available only when solving two-dimensional problems.

Planar

indicates that the problem is two-dimensional. (This option is available only when you start the 2D version of the solver.)

Axisymmetric

indicates that the domain is axisymmetric about the x axis. When **Axisymmetric** is enabled, the 2D axisymmetric form of the governing equations is solved instead of the 2D Cartesian form. (This option is available only when you start the 2D version of the solver.) Be sure to change the zone type of the axis of rotation to **axis**, using the *Boundary Conditions Task Page* (p. 1812), as described in *Changing Cell and Boundary Zone Types* (p. 207).

Axisymmetric Swirl

specifies that the swirl component (circumferential component) of velocity is to be included in your axisymmetric model. You should select this option if you are solving swirling flow in an axisymmetric geometry (see *Swirling and Rotating Flows* (p. 497) for more information).

Gravity

enables the specification of gravity.

Gravitational Acceleration

sets the x, y, and z components of the gravitational acceleration vector. (The z component is available only in 3D solvers.) See *Natural Convection and Buoyancy-Driven Flows* (p. 697) for details about buoyancy-driven flows. This option appears only when **Gravity** is enabled.

This quantity can be assigned to an input parameter (indicated by the small "p" icon next to the field). Clicking this icon displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters.

Units...

opens the *Set Units Dialog Box* (p. 1637).

For additional information, please see the following sections:

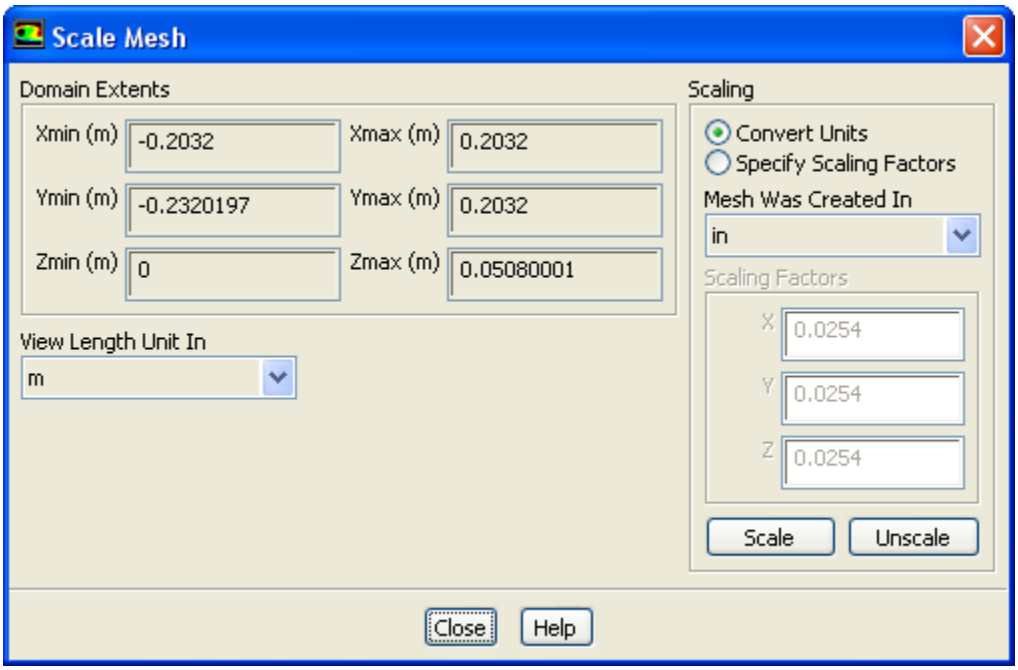
35.2.1. Scale Mesh Dialog Box
35.2.2. Mesh Display Dialog Box
35.2.3. Set Units Dialog Box
35.2.4. Define Unit Dialog Box

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.2.5. Mesh Colors Dialog Box

35.2.1. Scale Mesh Dialog Box

The **Scale Mesh** dialog box allows you to convert the mesh from various units of measurement to SI or to apply custom scale factors to the individual coordinates of the mesh. See *Scaling the Mesh* (p. 200) for details.



Controls

Domain Extents

displays the Cartesian coordinate extremes of the nodes in the mesh. (These values are not editable; they are purely informational.)

Xmin, Ymin, Zmin

shows the minimum values of Cartesian coordinates in the mesh.

Xmax, Ymax, Zmax

shows the maximum values of Cartesian coordinates in the mesh.

Scaling

contains controls for converting units and setting the scale factors automatically.

Convert Units

allows you to use the conversion factors provided by ANSYS FLUENT. Then indicate the units used when creating the mesh by selecting the appropriate abbreviation for meters, centimeters, millimeters, inches, or feet from the **Mesh Was Created In** drop-down list. The **Scaling Factors** will automatically be set to the correct values (e.g., 0.0254 meters/inch).

Specify Scaling Factors

allows you to manually specify a scale factor in each of the Cartesian coordinate directions.

Mesh Was Created In

contains a list of common units of length. The **Scaling Factors** will automatically be set based on your selection. The units include common SI and British units such as centimeters (cm), millimeters (mm), inches (in), and feet (ft).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Scaling Factors

contains the factors applied to the mesh in each of the Cartesian coordinate directions. You can enter values manually, or use the **Mesh Was Created In** list to set scale factors automatically.

X

is the scale factor in the x direction.

Y

is the scale factor in the y direction.

Z

is the scale factor in the z direction (appears only in 3D).

Scale

multiplies each of the node coordinates by the specified scale factors.

Unscale

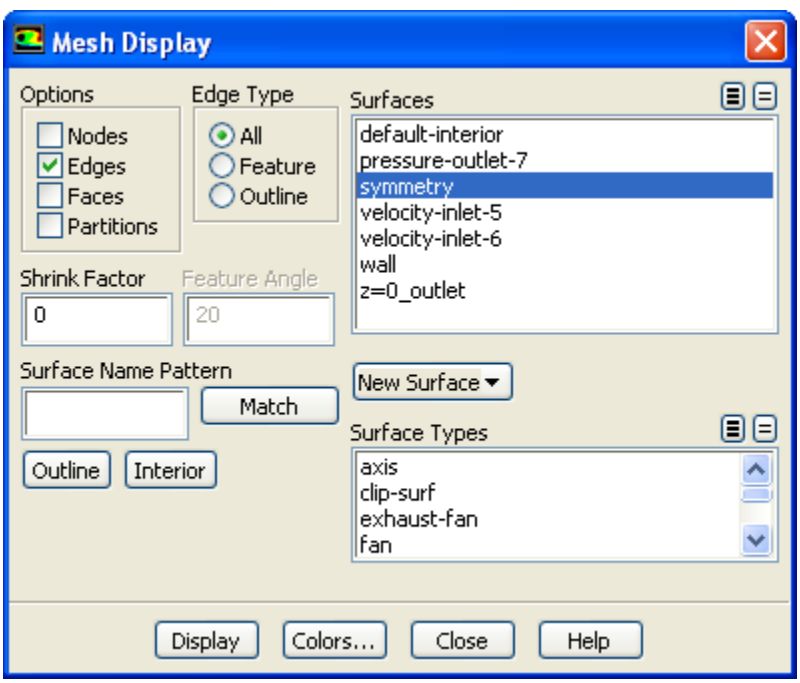
divides each of the node coordinates by the specified scale factors.

View Length Unit In

contains a list of common units of length. The **Domain Extents** will automatically be set based on your selection. The units include common SI and British units such as centimeters (cm), millimeters (mm), inches (in), and feet (ft). The units of length in the *Set Units Dialog Box* (p. 1637) will change each time you change your selection in the **View Length Unit In** drop-down list.

35.2.2. Mesh Display Dialog Box

The **Mesh Display** dialog box controls the display of zone, surface, and partition boundary meshes. See *Displaying the Mesh* (p. 1379) for details about the items below.



Controls

Options

contains the rendering options described below. To see the effects of your selection you must click the **Display** button.

Nodes
enables the display of nodes on the selected surfaces.

Edges
enables the display of mesh edges on the selected surfaces.

Faces
enables the display of mesh faces (filled meshes) on the selected surfaces.

Partitions
enables the display of partition boundaries.

Shrink Factor
specifies the amount to shrink faces and cells. See *Shrinking Faces and Cells in the Display* (p. 1385) for details.

Edge Type
controls the display of edges. (These items will not appear if the **Edges** option is turned off.)

All
enables the display of all mesh edges.

Feature
enables feature lines in an outline display. See *Adding Features to an Outline Display* (p. 1384) for details.

Outline
enables the display of the mesh outline.

Feature Angle
controls the amount of detail added to a feature outline display. See *Adding Features to an Outline Display* (p. 1384) for details. (This item will be available only if the **Feature** edge type is enabled.)

Surface Name Pattern
specifies the pattern to look for in the names of surfaces. Type the pattern in the text field and click **Match** to select (or deselect) the zones in the **Surfaces** list with names that match the specified pattern. See *Generating Mesh or Outline Plots* (p. 1381) for information about matching additional characters using * and ?.

Surfaces
contains a list from which you can select the surfaces for which the mesh is to be drawn.

New Surface
is a drop-down list button that contains a list of surface options:

Point
opens the *Point Surface Dialog Box* (p. 1927).

Line/Rake
opens the *Line/Rake Surface Dialog Box* (p. 1928).

Plane
opens the *Plane Surface Dialog Box* (p. 1929).

Quadric
opens the *Quadric Surface Dialog Box* (p. 1931).

Iso-Surface
opens the *Iso-Surface Dialog Box* (p. 1933).

Iso-Clip
opens the *Iso-Clip Dialog Box* (p. 1935).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Surface Types

contains a selectable list of types of surfaces. If you select (or deselect) an item in this list, all surfaces of that type will be selected (or deselected) automatically in the **Surfaces** list.

Outline

selects all "outline" boundaries in the **Surfaces** list. If all outline boundaries are already selected, it deselects them.

Interior

selects all "interior" surfaces in the **Surfaces** list. If all interior surfaces are already selected, it deselects them.

Display

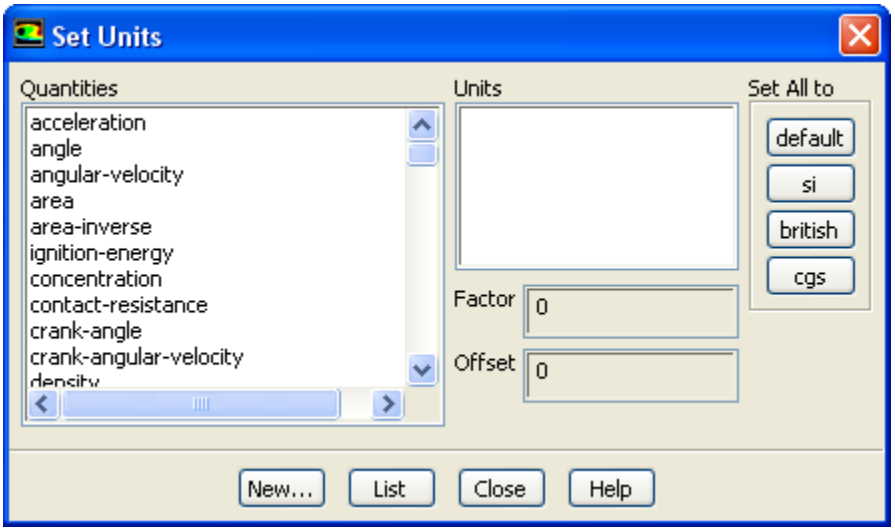
displays the defined mesh plot.

Colors...

opens the *Mesh Colors Dialog Box* (p. 1638).

35.2.3. Set Units Dialog Box

The **Set Units** dialog box allows you to set the units system for any quantity used in ANSYS FLUENT. All quantities may be set to a standard system, such as SI or British, or the units of individual quantities may be set. See *Unit Systems* (p. 125) for details about the items below.



Controls

Quantities

displays the list of all quantities used by ANSYS FLUENT for input and output.

Units

lists the units appropriate for the currently selected quantity. Selecting an item in the **Units** list causes that unit to be used for the currently selected quantity.

Factor

displays the conversion factor from the currently selected units to SI.

Offset

displays the conversion offset from the currently selected units to SI.

Set All to

contains standard sets of units that are applied to all quantities when selected.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

default
is similar to **si**, but uses degrees instead of radians for angles.

si
selects the System International (SI) standard for all units.

british
selects the English Engineering standard for all units.

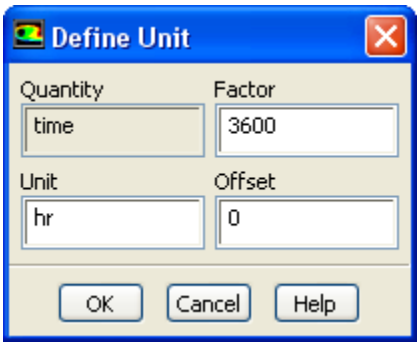
cgs
selects the CGS (centimeter-gram-second) standard for all units

New...
opens the *Define Unit Dialog Box* (p. 1638), in which you can specify a customized unit for a particular quantity.

List
displays the current units for all quantities in the console.

35.2.4. Define Unit Dialog Box

The **Define Unit** dialog box allows you to customize the units for a particular quantity. It is opened from the *Set Units Dialog Box* (p. 1637). For details about using this dialog box, see *Defining a New Unit* (p. 127).



Controls

Quantity
shows the name of the quantity for which you are defining a new unit. (You cannot edit this field; the quantity is selected in the *Set Units Dialog Box* (p. 1637).)

Unit
sets the name for the new unit.

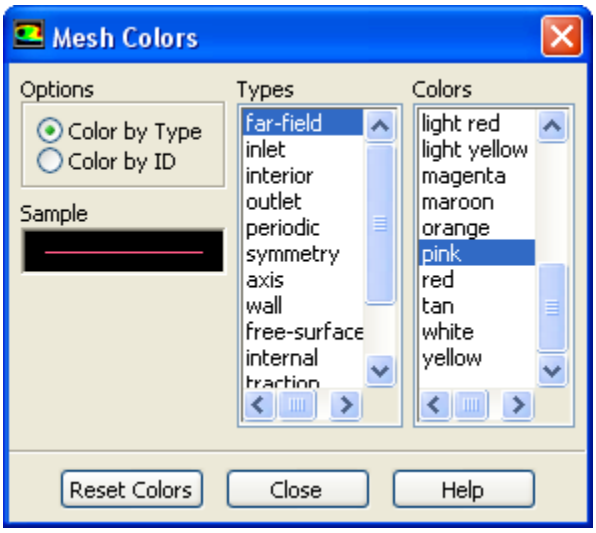
Factor
sets the conversion factor from the currently selected units to SI.

Offset
sets the conversion offset from the currently selected units to SI.

35.2.5. Mesh Colors Dialog Box

The **Mesh Colors** dialog box allows you to control the colors that are used to draw meshes. It is opened from the *Mesh Display Dialog Box* (p. 1635). See *Modifying the Mesh Colors* (p. 1383) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options
contains options to select the method by which to set the colors.

Color by Type
sets the color based on the type of zone.

Color by ID
sets the color by ID.

Types
contains a selectable list of zone types. You can select the zone type for which you want to set the color.

Colors
contains a list from which you can select a color for the selected type.

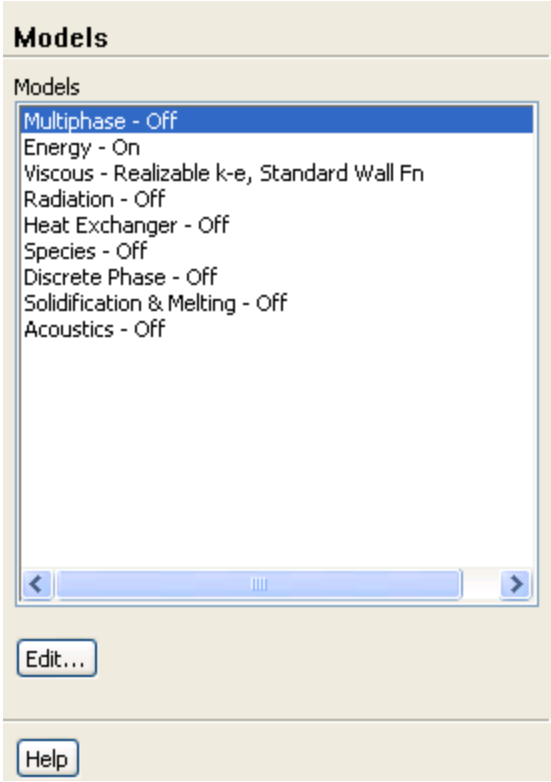
Sample
displays a sample of the currently selected color.

Reset Colors
resets the mesh colors to the default selections.

35.3. Models Task Page

The **Models** task page allows you to set various generic model settings.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Models

contains a listing of the various models available in ANSYS FLUENT.

You can double-click an item in the **Models** list to open the corresponding dialog box, or you can select the item in the list and click the **Edit...** button.

Multiphase

- selecting this item and clicking the **Edit...** button opens the *Multiphase Model Dialog Box* (p. 1642).

Energy

- selecting this item and clicking the **Edit...** button opens the *Energy Dialog Box* (p. 1645).

Viscous

- selecting this item and clicking the **Edit...** button opens the *Viscous Model Dialog Box* (p. 1645).

Radiation

- selecting this item and clicking the **Edit...** button opens the *Radiation Model Dialog Box* (p. 1657).

Heat Exchanger

- selecting this item and clicking the **Edit...** button opens the *Heat Exchanger Model Dialog Box* (p. 1666).

Species

- selecting this item and clicking the **Edit...** button opens the *Species Model Dialog Box* (p. 1681).

The following models are made available, depending on your setup of the **Species** dialog box.

- **Spark Ignition** - selecting this item and clicking the **Edit...** button opens the *Spark Ignition Dialog Box* (p. 1700). Note that spark ignition is only available for transient calculations.
- **Autoignition** - selecting this item and clicking the **Edit...** button opens the *Autoignition Model Dialog Box* (p. 1703). Note that autoignition is only available for transient calculations.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

- **Inert** - selecting this item and clicking the **Edit...** button opens the *Inert Dialog Box* (p. 1705). Note that the inert model is only available when the non-premixed or partially premixed model is selected in the **Species Model** dialog box, or when a PDF file is read.
- **NOx** - selecting this item and clicking the **Edit...** button opens the *NOx Model Dialog Box* (p. 1706). Note that the NOx model is not compatible with premixed combustion.
- **SOx** - selecting this item and clicking the **Edit...** button opens the *SOx Model Dialog Box* (p. 1713). Note that the SOx model is not compatible with premixed combustion.
- **Soot** - selecting this item and clicking the **Edit...** button opens the *Soot Model Dialog Box* (p. 1717). Note that none of the soot models are compatible with premixed combustion.
- **Decoupled Detailed Chemistry** - selecting this item and clicking the **Edit...** button opens the *Decoupled Detailed Chemistry Dialog Box* (p. 1722).

Discrete Phase
- selecting this item and clicking the **Edit...** button opens the *Discrete Phase Model Dialog Box* (p. 1723).

Solidification & Melting
- selecting this item and clicking the **Edit...** button opens the *Solidification and Melting Dialog Box* (p. 1730).

Acoustics
- selecting this item and clicking the **Edit...** button opens the *Acoustics Model Dialog Box* (p. 1731).

Edit...
displays the dialog box corresponding to the selected item in the **Models** list.

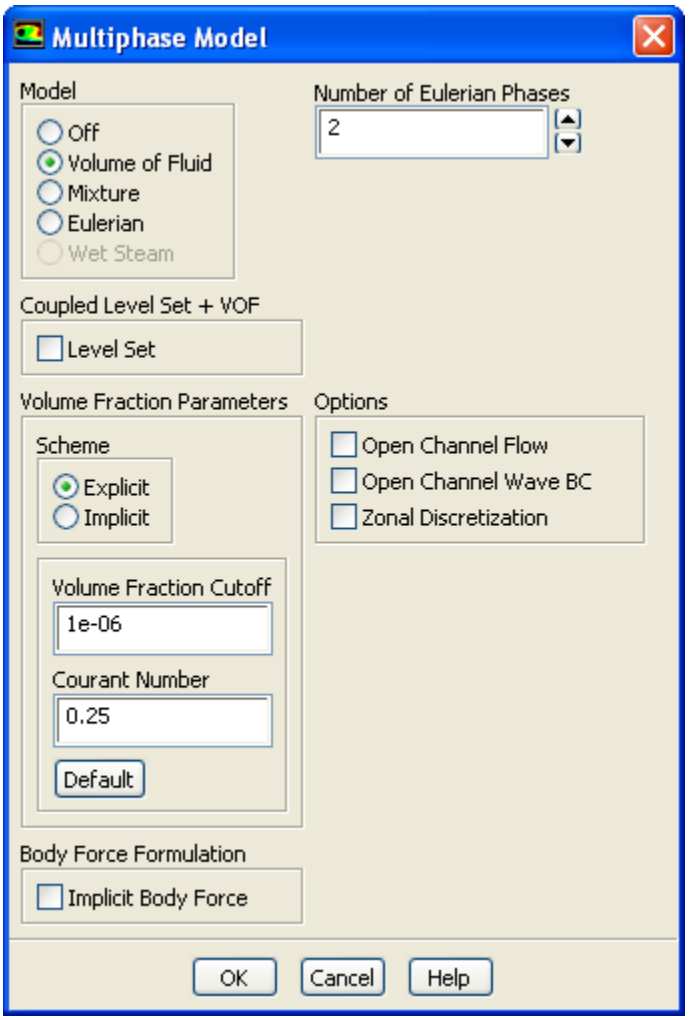
35.3.33. Solidification and Melting Dialog Box
35.3.34. Acoustics Model Dialog Box
35.3.35. Acoustic Sources Dialog Box
35.3.36. Acoustic Receivers Dialog Box
35.3.37. Interior Cell Zone Selection Dialog Box

35.3.1. Multiphase Model Dialog Box

The **Multiphase Model** dialog box allows you to set parameters for modeling multiphase flow. See *Enabling the Multiphase Model* (p. 1093) – *Including Cavitation Effects* (p. 1153) for details.



Controls

Model

allows you to select one of four multiphase models.

Off

disables the calculation of multiphase flow.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Volume of Fluid

enables the VOF model described in Volume of Fluid (VOF) Model Theory in the Theory Guide. See *Setting Up the VOF Model* (p. 1120) for details about using the model. This is available only with the pressure-based solver.

Mixture

enables the mixture model described in Mixture Model Theory in the Theory Guide. See *Setting Up the Mixture Model* (p. 1145) for details about using the model. This is available only with the pressure-based solver.

Eulerian

enables the Eulerian model described in Eulerian Model Theory in the Theory Guide. See *Setting Up the Eulerian Model* (p. 1154) for details about using the model. This is available only with the pressure-based solver.

Wet Steam

enables the wet steam model described in Wet Steam Model Theory in the Theory Guide. See *Setting Up the Wet Steam Model* (p. 1178) for details about using the model. This is available only with the density-based solver.

Number of Eulerian Phases

allows you to specify the number of phases for the multiphase calculation. You can specify up to 20 phases.

Coupled Level Set + VOF

allows you to apply an interface tracking method that couples the level set method with the VOF formulation.

Volume Fraction Parameters

contains parameters related to the VOF and Eulerian model. This section of the dialog box will appear only when **Volume of Fluid** or **Eulerian** is the selected **Model**.

Scheme

allows you to select the desired interface-tracking scheme.

Explicit

enables the Euler explicit scheme, described in The Explicit Scheme in the Theory Guide. See *Choosing a Volume Fraction Formulation* (p. 1095) for more information.

Implicit

enables the implicit scheme, described in The Implicit Scheme in the Theory Guide. See *Choosing a Volume Fraction Formulation* (p. 1095) for more information.

Volume Fraction Cutoff

specifies a cutoff limit for the volume fraction values. The value that you provide is used as the lower cutoff for the volume fraction. All volume fraction values in the domain below this cutoff value are set to zero. The upper cutoff is calculated as (1.0 - lower cutoff). All volume fraction values above the upper cutoff value are set to 1.0. The default value is 1e-6.

Important

The **Volume Fraction Cutoff** value can be specified when using the VOF model, or when using the Eulerian Multiphase model with the **Explicit** scheme.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Courant Number
specifies the maximum Courant number allowed near the free surface. This item will not appear if the **Implicit Scheme** is selected. See *Setting Time-Dependent Parameters for the VOF Model* (p. 1143) for details.

Open Channel Flow
enables the model to study the effects of open channel flow. See Open Channel Flow in the Theory Guide and *Modeling Open Channel Flows* (p. 1121) for details.

Open Channel Wave BC
enables the model to set specific parameters for a particular boundary for open channel wave boundaries. See Backflow Volume Fraction Specification in the Theory Guide and *Modeling Open Channel Wave Boundary Conditions* (p. 1127) for details.

Zonal Discretization
allows you to set the value of the slope limiter. You can select either diffused or sharp interface behavior in different cell zones. This option is available if the **Volume of Fluid** model is used, or if the **Eulerian** model with the **Immiscible Fluid Model** option is enabled.

Mixture Parameters
contains options related to the **Mixture** model.

Slip Velocity
enables/disables the calculation of slip velocities for the secondary phases as described in Relative (Slip) Velocity and the Drift Velocity in the Theory Guide. See also *Solving a Homogeneous Multiphase Flow* (p. 1098).

Eulerian Parameters
contains options related to the **Eulerian** model.

Dense Discrete Phase Model
allows you to include the Dense Discrete Phase model (see *Including the Dense Discrete Phase Model* (p. 1167) for details). Enabling this model automatically enables the DPM model.

Immiscible Fluid Model
allows you to include the Immiscible Fluid model (see *Including the Immiscible Fluid Model* (p. 1176) for details). The immiscible fluid model allows the modeling of interface sharpening schemes and free surface flow.

Boiling Model
allows you to include the Boiling model (see *Including the Boiling Model* (p. 1171) for details).

Number of Discrete Phase
allows you to specify the number of discrete phases when the **Dense Discrete Phase Model** option is enabled.

Body Force Formulation
contains an additional option for body force calculations.

Implicit Body Force
enables the implicit body force treatment described in *Including Body Forces* (p. 1099).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note

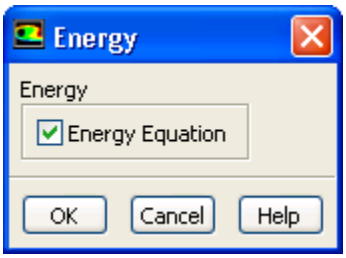
If you want ANSYS FLUENT to solve the volume fraction equation(s) at every iteration within a time step, use the text command:

`define` → `models` → `multiphase` →

and select `vof` as the model. When prompted to `solve vof every iteration?`, enter `yes`.

35.3.2. Energy Dialog Box

The **Energy** dialog box allows you to set parameters related to energy or heat transfer in your model.



Controls

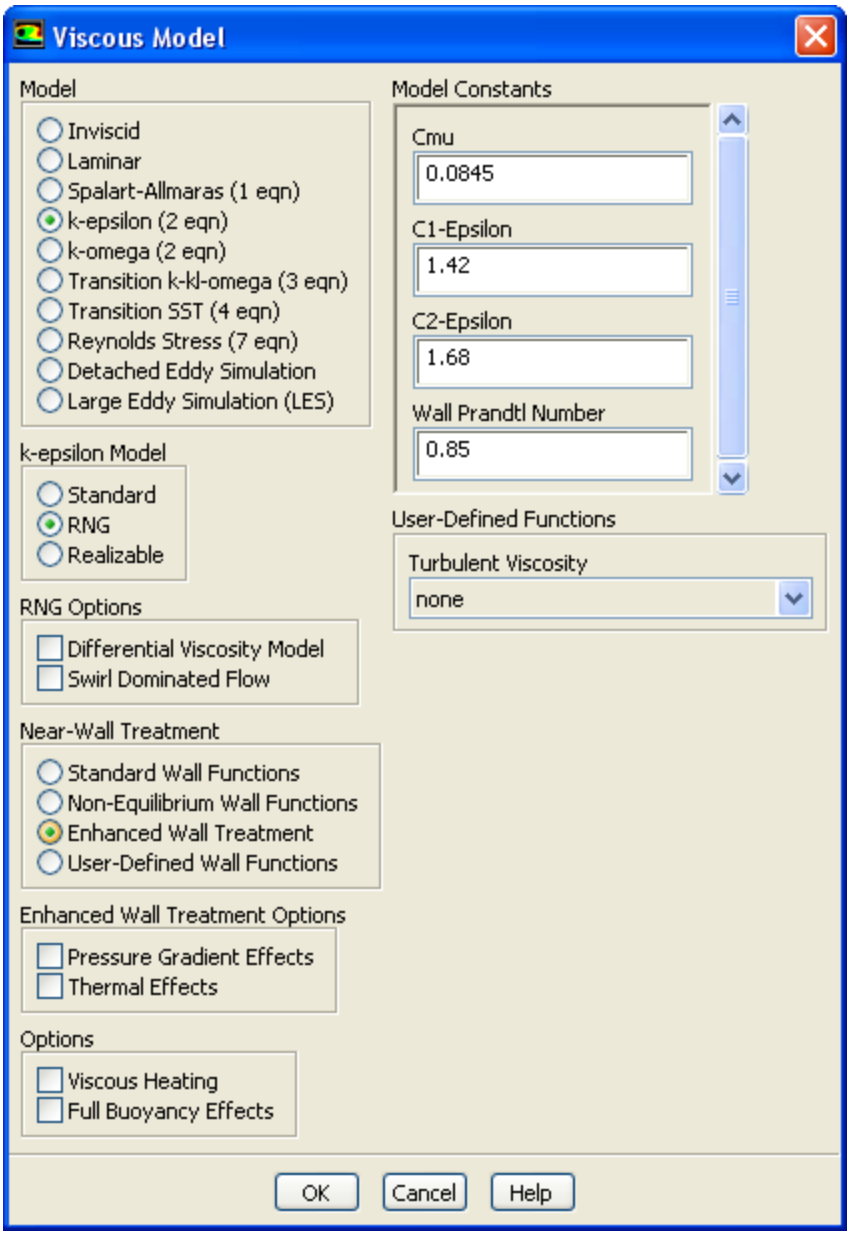
Energy
contains inputs related to the modeling of energy.

Energy Equation
enables/disables the calculation of energy in the model.

35.3.3. Viscous Model Dialog Box

The **Viscous Model** dialog box allows you to set parameters for inviscid, laminar, and turbulent flow. See *Steps in Using a Turbulence Model* (p. 655) for details about using this dialog box to set up a turbulent flow calculation.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Model

contains options for specifying the viscous model.

Inviscid

specifies inviscid flow.

Laminar

specifies laminar flow.

Spalart-Allmaras

specifies turbulent flow to be calculated using the Spalart-Allmaras model. (See Spalart-Allmaras Model in the Theory Guide for background about this model. See *Setting Up the Spalart-Allmaras Model* (p. 657) for details about using this model.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

k-epsilon

specifies turbulent flow to be calculated using one of three k- ε models. (See Standard, RNG, and Realizable k- ε Models in the Theory Guide for background about this model. See *Setting Up the k- ε Model* (p. 658) for details about using this model.)

k-omega

specifies turbulent flow to be calculated using one of two k- ω models. (See Standard and SST k- ω Models in the Theory Guide for background about these models. See *Setting Up the k- ω Model* (p. 661) for details about using this model.)

Transition k-kl-omega

specifies turbulent flow to be calculated using the Transition k- kl- ω model. (See k- kl- ω Transition Model in the Theory Guide for background about this model. See *Setting Up the Transition k- kl- ω Model* (p. 662) for details about using this model.)

Transition SST

specifies turbulent flow to be calculated using the Transition SST model. (See Transition SST Model in the Theory Guide for background about this model. See *Setting Up the Transition SST Model* (p. 662) for details about using this model.)

Reynolds Stress

specifies turbulent flow to be calculated using the RSM. (See Reynolds Stress Model (RSM) in the Theory Guide for background about this model. See *Setting Up the Reynolds Stress Model* (p. 663) for details about using this model.)

Scale-Adaptive Simulation

specifies turbulent flow to be unsteady. (See Scale-Adaptive Simulation (SAS) Model in the Theory Guide for background about this model. See *Setting Up the Scale-Adaptive Simulation (SAS) Model* (p. 666) for details about using this model.)

Detached Eddy Simulation

specifies turbulent flow to be calculated using the DES. (See Detached Eddy Simulation (DES) in the Theory Guide for background about this model. See *Setting Up the Detached Eddy Simulation Model* (p. 666) for details about using this model.)

Large Eddy Simulation

(3D only) specifies turbulent flow to be calculated using the LES model. (See Large Eddy Simulation (LES) Model in the Theory Guide for background about this model. See *Setting Up the Large Eddy Simulation Model* (p. 669) for details about using this model.)

Spalart-Allmaras Production

contains options for the Spalart-Allmaras model. This portion of the dialog box will appear only if **Spalart-Allmaras** is selected as the **Model**.

Vorticity-Based

selects the vorticity-based calculation of the deformation tensor S (see Equation 4–22 in the Theory Guide).

Strain/Vorticity-Based

selects the strain/vorticity-based calculation of the deformation tensor S (see Equation 4–24 in the Theory Guide).

Spalart-Allmaras Options

contains options for the Spalart-Allmaras model. This portion of the dialog box will appear only if **Spalart-Allmaras** is selected as the **Model**.

Low-Re Damping

allows you to enable a low-Reynolds damping to the turbulent viscosity (see *Low-Re Damping* (p. 675) for details).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

k-epsilon Model

contains options for specifying which of the k- ε models is to be used. This portion of the dialog box will appear only if **k-epsilon** is selected as the **Model**.

Standard

selects the standard k- ε model, described in Standard k- ε Model in the Theory Guide and *Setting Up the k- ε Model* (p. 658).

RNG

selects the RNG k- ε model, described in RNG k- ε Model. in the Theory Guide and *Setting Up the k- ε Model* (p. 658).

Realizable

selects the realizable k- ε model, described in Realizable k- ε Model in the Theory Guide and *Setting Up the k- ε Model* (p. 658).

RNG Options

specifies parameters that affect the solution of problems solved with the RNG k- ε model. This portion of the dialog box will appear only if **RNG** is selected as the **k-epsilon Model**.

Differential Viscosity Model

specifies whether or not the low-Reynolds-number RNG modifications to turbulent viscosity should be included. By default, this option is turned off. It is likely to have an effect only when the near-wall regions in the domain are well resolved in terms of mesh density. See *Differential Viscosity Modification* (p. 674) for details.

Swirl Dominated Flow

specifies whether or not the RNG modification to turbulent viscosity for swirling flows should be included. This option is available only in 3D and 2D axisymmetric swirl solvers, and it can yield improved predictions when solving flows with significant swirl. See *Swirl Modification* (p. 674) for details.

k-omega Model

contains options for specifying which of the k- ω models is to be used. This portion of the dialog box will appear only if **k-omega** is selected as the **Model**.

Standard

selects the standard k- ω model, described in Standard k- ω Model in the Theory Guide and *Setting Up the k- ω Model* (p. 661).

SST

selects the shear-stress transport (SST) k- ε model, described in Shear-Stress Transport (SST) k- ω Model in the Theory Guide and *Setting Up the k- ω Model* (p. 661).

k-omega Options

specifies parameters that affect the solution of problems solved with the k- ω models. This portion of the dialog box will appear only if **k-omega** is selected as the **Model**.

Low-Re Corrections

specifies whether corrections that improve the accuracy in predicting low Reynolds number flows should be included. This option is available only for the standard k- ω model. See *Low-Re Corrections* (p. 675) for details.

Shear Flow Corrections

specifies whether corrections that improve the accuracy in predicting free shear flows should be included. This option is available only for the standard k- ω model. See *Shear Flow Corrections* (p. 675) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulence Damping

is required for the accurate modeling of the interfacial area. This option is available for the standard and SST k- ω model. The VOF and Mixture models and also the Eulerian multiphase model with the immiscible fluid model must be selected when using this option. Enter the desired **Damping Factor**, which by default is set to 10. See *Turbulence Damping* (p. 675) for details.

Reynolds-Stress Model

specifies the various Reynolds stress models (RSM).

Linear Pressure-Strain

enables the linear pressure-strain model. See Linear Pressure-Strain Model in the Theory Guide for details.

Quadratic Pressure-Strain

enables the quadratic pressure-strain model for superior performance in a range of basic shear flows, including plane strain, rotating plane shear, and axisymmetric expansion/contraction. See Quadratic Pressure-Strain Model in the Theory Guide for details. Note that this option cannot be used with the **Wall Reflection Effects** option or the **Enhanced Wall Treatment**.

Stress-Omega

enables a stress-transport model that is based on the omega equations and LRR model [*102*] (p. 2214). This model is ideal for modeling flows over curved surfaces and swirling flows. See Low-Re Stress-Omega Model in the Theory Guide for details.

Reynolds-Stress Options

specifies parameters that affect the solution of problems solved with the Reynolds stress model. This portion of the dialog box will appear only if **Reynolds Stress** is selected as the **Model**.

Wall BC from k Equation

enables the explicit setting of boundary conditions for the Reynolds stresses near the walls, using the values computed with Equation 4–218 in the Theory Guide. See *Solving the k Equation to Obtain Wall Boundary Conditions* (p. 676) for details. This option is on by default.

Wall Reflection Effects

enables the calculation of the component of the pressure strain term responsible for the redistribution of normal stresses near the wall. See *Including the Wall Reflection Term* (p. 676) for details. Note that this option is not available if you have enabled the **Quadratic Pressure-Strain Model**.

RANS Model

contains options for the subgrid-scale model used by the **Detached Eddy Simulation Model**. This portion of the dialog box will appear only if **Detached Eddy Simulation Model** is selected as the **Model**.

Spalart-Allmaras

enables the Spalart-Allmaras RANS model. See Detached Eddy Simulation (DES) in the Theory Guide for details.

Realizable k-epsilon

enables the Realizable k- ε RANS model. See Detached Eddy Simulation (DES) in the Theory Guide for details.

SST k-omega

enables the SST k- ω RANS Model. See Detached Eddy Simulation (DES) in the Theory Guide for details.

DES Options

contain the option to include a delayed Detached Eddy Simulation.

Delayed DES

is useful for RANS meshes with high aspect ratios in the boundary layer. This option preserves the RANS model throughout the boundary layer. (See *Delayed Detached Eddy Simulation (DDES)* (p. 674) for details.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Subgrid-Scale Model

contains options for the subgrid-scale model used by the LES model. This portion of the dialog box will appear only if **Large Eddy Simulation** is selected as the **Model**.

Smagorinsky-Lilly

selects the Smagorinsky-Lilly subgrid-scale model described in Subgrid-Scale Models in the Theory Guide.

WALE

selects the Wall-Adapting local Eddy-Viscosity model described in Wall-Adapting Local Eddy-Viscosity (WALE) Model in the Theory Guide.

Kinetic-Energy Transport

selects the dynamic kinetic energy subgrid-scale model described in Dynamic Kinetic Energy Subgrid-Scale Model in the Theory Guide.

LES Model Options

contains options for the Large Eddy Simulation model. This portion of the dialog box will appear only if **Large Eddy Simulation** is selected as the **Model**.

Dynamic Stress

enables the dynamic stress model. It is available when the LES option **Smagorinsky-Lilly** is enabled.

Dynamic Energy Flux

enables the dynamic energy flux model. It is available when the LES option **Kinetic-Energy Transport** is enabled.

Dynamic Scalar Flux

enables the dynamic computation of turbulent Sc (σ_t in Equation 8–5 in the Theory Guide). See Definition of the Mixture Fraction in the Theory Guide for details.

Near-Wall Treatment

specifies the near-wall treatment to be used for modeling turbulence. See Near-Wall Treatments for Wall-Bounded Turbulent Flows in the Theory Guide for details about the available methods. This portion of the dialog box will appear if **k-epsilon** or **Reynolds Stress** is selected as the **Model**.

Standard Wall Functions

enables the use of standard wall functions (described in Standard Wall Functions in the Theory Guide).

Non-Equilibrium Wall Functions

enables the use of non-equilibrium wall functions (described in Non-Equilibrium Wall Functions in the Theory Guide).

Enhanced Wall Treatment

enables the use of the enhanced wall treatment (described in Enhanced Wall Treatment ε-Equation (EWT-ε) in the Theory Guide). Note that this option will not appear if you have enabled the **Quadratic Pressure-Strain Model** under **Reynolds-Stress Options**.

User-Defined Wall Functions

enables you to hook a user-defined function, used to define the **Law of the Wall**. See User-Defined Wall Functions in the Theory Guide for more information.

Enhanced Wall Treatment Options

allows you to include pressure gradient or thermal effects in the calculation. See Near-Wall Treatments for Wall-Bounded Turbulent Flows in the Theory Guide.

Pressure Gradient Effects

enables the effect of pressure gradient.

Thermal Effects

enables thermal effects in the calculation. This option appears only if the energy equation is enabled.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

contains general options for viscous modeling.

Viscous Heating

(if enabled) includes the viscous dissipation terms in the energy equation. This option is recommended when you are solving a compressible flow. Note that this option is always turned on when one of the density-based solvers is used; you will not be able to turn it off.

Low-Pressure Boundary Slip

includes slip boundary conditions for velocity and temperature for modeling fluid flow at very low pressures as in semiconductor fabrication devices. See Slip Boundary Formulation for Low-Pressure Gas Systems in the Theory Guide. This option is available only for laminar flows.

Full Buoyancy Effects

enables the inclusion of buoyancy effects on ε. See *Including Turbulence Generation Due to Buoyancy* (p. 674) for details. This option will appear if **k-epsilon** or **Reynolds Stress** is selected as the **Model** *and* a non-zero gravitational acceleration has been specified in the *Operating Conditions Dialog Box* (p. 1806).

Turbulent Drift Force

includes the effect of drift velocity. See *Modeling Turbulence* (p. 1163). Note that this option is only available if either the **Eulerian** multiphase model is selected, or the **Mixture** model with **Slip Velocity** is enabled in the **Multiphase Model** dialog box.

Turbulence Multiphase Model

contains options for multiphase turbulence models. This portion of the dialog box will appear if **Eulerian** is selected as the **Model** in the *Multiphase Model Dialog Box* (p. 1642).

Mixture

specifies the (default) mixture turbulence model.

Dispersed

specifies the dispersed turbulence model.

Per Phase

specifies the calculation of a set of turbulence equations for each phase.

See Turbulence Models in the Theory Guide for details about the available multiphase turbulence models.

Model Constants

contains constants used in the equations for turbulence. See Spalart-Allmaras Model, Standard k-ε Model, RNG k-ε Model, k-kl-ω Transition Model, Transition SST Model, Realizable k-ε Model, Reynolds Stress Model (RSM), Standard k-ω Model, Shear-Stress Transport (SST) k-ω Model, and Large Eddy Simulation (LES) Model in the Theory Guide for details about these constants.

Cb1

(only for the Spalart-Allmaras model) is the constant C_{b1} in Equation 4–19 in the Theory Guide.

Cb2

(only for the Spalart-Allmaras model) is the constant C_{b2} in Equation 4–15 in the Theory Guide.

Cv1

(only for the Spalart-Allmaras model) is the constant C_{v1} in Equation 4–17 in the Theory Guide.

Cw2

(only for the Spalart-Allmaras model) is the constant C_{w2} in Equation 4–28 in the Theory Guide.

Cw3

(only for the Spalart-Allmaras model) is the constant C_{w3} in Equation 4–27 in the Theory Guide.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cprod

(only for the Spalart-Allmaras model when the **Strain/Vorticity-Based Production** option is used) is the constant C_{prod} in Equation 4–24 in the Theory Guide.

Cmu

(only for the standard or RNG k- ε model, the RSM, or the k- kl- ω Transition model) is the constant C_μ that is used to compute μ_t.

C1-Epsilon

(only for the standard or RNG k- ε model or the RSM) is the constant $C_{1\varepsilon}$ used in the transport equation for ε.

C2-Epsilon

(only for the standard, RNG, or realizable k- ε model or the RSM) is the constant $C_{2\varepsilon}$ used in the transport equation for ε.

C3-Epsilon

(only for the dispersed or per-phase k- ε multiphase models) is the constant $C_{3\varepsilon}$ in Equation 17–248 in the Theory Guide.

C-lambda

(only for the k- kl- ω Transition model) is the constant C_λ in the definition of the effective length,

CR

(only for the k- kl- ω Transition model) is the constant C_R used in the definition of R, where R represents the averaged effect of the breakdown of streamwise fluctuations into turbulence during bypass transition

ANAT

(only for the k- kl- ω Transition model) is the constant A_{NAT}

ATS

(only for the k- kl- ω Transition model) is the constant A_{TS}

CNAT, crit

(only for the k- kl- ω Transition model) is the constant $C_{NAT,crit}$

CTS, crit

(only for the k- kl- ω Transition model) is the constant $C_{TS,crit}$

CRNAT

(only for the k- kl- ω Transition model) is the constant $C_{R,NAT}$

Anu

(only for the k- kl- ω Transition model) is the constant A_v

CINT

(only for the k- kl- ω Transition model) is the constant C_{INT}

Cw1

(only for the k- kl- ω Transition model) is the constant $C_{\omega 1}$

Cw3

(only for the k- kl- ω Transition model) is the constant $C_{\omega 3}$

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Calpha-teta

(only for the k- kl- ω Transition model) is the constant $C_{\alpha,\theta}$

Ctaul

(only for the k- kl- ω Transition model) is the constant $C_{\tau,1}$

SDR Prandtl Number

(only for the k- kl- ω Transition model) is the effective "Prandtl" number for the transport of the specific dissipation rate, σ_{ω}.

Ca1

(only for the Transition SST model)

Ca2

(only for the Transition SST model)

Ce1

(only for the Transition SST model)

Ce2

(only for the Transition SST model)

C_thetat

(only for the Transition SST model)

C_s1

(only for the Transition SST model)

Intermit. Prandtl #)

(only for the Transition SST model)

Re_theta. Prandtl #)

(only for the Transition SST model)

Swirl Factor

sets the value of α_s in Equation 4–40 in the Theory Guide. This item appears for the RNG k- ε model when the **Swirl Dominated Flow** option is turned on.

Alpha*_inf

(only for the standard or SST k- ω model, and the Transition SST model) is the constant α_{∞}^{*} in Equation 4–68 in the Theory Guide.

Alpha_inf

(only for the standard or SST k- ω model, and the Transition SST model) is the constant α_{∞} in Equation 4–76 in the Theory Guide.

Alpha_0

(only for the standard or SST k- ω model with the **Transitional Flows** option enabled) is the constant α_0 in Equation 4–76 in the Theory Guide.

Beta*_inf

(only for the standard or SST k- ω model, and the Transition SST model) is the constant β_{∞}^{*} in Equation 4–81 in the Theory Guide.

Beta_i

(only for the standard k- ω model) is the constant β_i in Equation 4–89 in the Theory Guide.

R_beta

(only for the standard or SST k- ω model) is the constant R_{β} in Equation 4–81 in the Theory Guide.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

R_k

(only for the standard or SST k- ω model with the **Transitional Flows** option enabled) is the constant R_k in Equation 4–68 in the Theory Guide.

R_w

(only for the standard or SST k- ω model with the **Transitional Flows** option enabled) is the constant R_ω in Equation 4–76 in the Theory Guide.

Zeta*

(only for the standard or SST k- ω model) is the constant ζ^* in Equation 4–80 in the Theory Guide.

Mt0

(only for the standard or SST k- ω model) is the constant M_{t0} in Equation 4–90 in the Theory Guide.

a1

(only for the SST k- ω model, and the Transition SST model) is the constant a_1 in Equation 4–98 in the Theory Guide.

Beta_i (Inner)

(only for the SST k- ω model, and the Transition SST model) is the constant $\beta_{i,1}$ in Model Constants in the Theory Guide.

Beta_i (Outer)

(only for the SST k- ω model, and the Transition SST model) is the constant $\beta_{i,2}$ in Model Constants in the Theory Guide.

Cs

(only for LES) is the Smagorinsky constant C_s in Equation 4–252 in the Theory Guide.

C1-PS

(only for RSM) is the constant C_1 in Equation 4–189 in the Theory Guide.

C2-PS

(only for RSM) is the constant C_2 in Equation 4–190 in the Theory Guide.

C1′-PS

(only for RSM) is the constant C_1' in Equation 4–191 in the Theory Guide.

C2′-PS

(only for RSM) is the constant C_2' in Equation 4–191 in the Theory Guide.

C1-SSG-PS

(only for RSM with the **Quadratic Pressure-Strain Model**) is the constant C_1 in Equation 4–200 in the Theory Guide.

C1′-SSG-PS

(only for RSM with the **Quadratic Pressure-Strain Model**) is the constant C_1^* in Equation 4–200 in the Theory Guide.

C2-SSG-PS

(only for RSM with the **Quadratic Pressure-Strain Model**) is the constant C_2 in Equation 4–200 in the Theory Guide.

C3-SSG-PS

(only for RSM with the **Quadratic Pressure-Strain Model**) is the constant C_3 in Equation 4–200 in the Theory Guide.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

C3'-SSG-PS

(only for RSM with the **Quadratic Pressure-Strain Model**) is the constant C_3^* in Equation 4–200 in the Theory Guide.

C4-SSG-PS

(only for RSM with the **Quadratic Pressure-Strain Model**) is the constant C_4 in Equation 4–200 in the Theory Guide.

C5-SSG-PS

(only for RSM with the **Quadratic Pressure-Strain Model**) is the constant C_5 in Equation 4–200 in the Theory Guide.

Prandtl Number

(only for the Spalart-Allmaras model) is the constant $\sigma_{\tilde{\nu}}$ in Equation 4–15 in the Theory Guide.

TKE Prandtl Number

(only for the standard or realizable k- ε model, the standard or SST k- ω model, the k- kl- ω Transition model, or the RSM) is the effective "Prandtl" number for transport of turbulence kinetic energy σ_k. This effective Prandtl number defines the ratio of the momentum diffusivity to the diffusivity of turbulence kinetic energy via turbulent transport.

TKE (Inner) Prandtl #

(only for the SST k- ω model, and the Transition SST model) is the effective "Prandtl" number for the transport of turbulence kinetic energy, $\sigma_{k,1}$, inside the near-wall region. See Modeling the Effective Diffusivity in the Theory Guide for details.

TKE (Outer) Prandtl #

(only for the SST k- ω model, and the Transition SST model) is the effective "Prandtl" number for the transport of turbulence kinetic energy, $\sigma_{k,2}$, outside the near-wall region. See Modeling the Effective Diffusivity in the Theory Guide for details.

TDR Prandtl Number

is the effective "Prandtl" number for transport of the turbulent dissipation rate, σ_ε, for the standard or realizable k- ε model or the RSM. This effective Prandtl number defines the ratio of the momentum diffusivity to the diffusivity of turbulence dissipation via turbulent transport.

For the standard k- ω model, the **TDR Prandtl Number** is the effective "Prandtl" number for the transport of the specific dissipation rate, σ_ω.

SDR (Inner) Prandtl #

(only for the SST k- ω model, and the Transition SST model) is the effective "Prandtl" number for the transport of the specific dissipation rate, $\sigma_{\omega,1}$, inside the near-wall region. See Modeling the Effective Diffusivity in the Theory Guide for details.

SDR (Outer) Prandtl #

(only for the SST k- ω model, and the Transition SST model) is the effective "Prandtl" number for the transport of the specific dissipation rate, $\sigma_{\omega,2}$, outside the near-wall region. See Modeling the Effective Diffusivity in the Theory Guide for details.

Dispersion Prandtl Number

(only for the k- ε multiphase models) is the effective "Prandtl" number for the dispersed phase, σ_{pq}. See Turbulence Models in the Theory Guide for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Energy Prandtl Number

(for any turbulence model except the RNG k- ε model) is the turbulent Prandtl number for energy, Pr_t, in Equation 4–208 in the Theory Guide. (This item will not appear for premixed or partially premixed combustion models.)

Wall Prandtl Number

(for all turbulence models) is the turbulent Prandtl number at the wall, Pr_t in Equation 4–278 in the Theory Guide. (This item will not appear for adiabatic premixed combustion or partially premixed combustion models.)

Turbulent Schmidt Number

(for turbulent species transport calculations using any turbulence model except the RNG k- ε model) is the turbulent Schmidt number, Sc_t, in Equation 7–3 in the Theory Guide.

PDF Schmidt Number

(for non-premixed or partially premixed combustion calculations using any turbulence model) is the model constant σ_t in Equation 8–5 in the Theory Guide.

User-Defined Transition Correlations

(only for the Transition SST model) allows you to select the user-defined correlations for **F_length**, **Re_thetac**, **Re_thetat**.

User-Defined Functions

allows you to select the user-defined functions for various constants.

Turbulent Viscosity

appears for Spalart Allmaras, k- ε and k- ω models. You can select the user-defined functions for turbulent viscosity in the drop-down list.

Prandtl Numbers

contains a list of relevant Prandtl numbers for which you can select user-defined functions.

TKE Prandtl Number

allows you to select a user-defined function to define the TKE Prandtl number for the standard and realizable k- ε models and the standard k- ω model.

TDR Prandtl Number

allows to select a user-defined function to define the TDR Prandtl number for the standard and realizable k- ε models.

Energy Prandtl Number

allows you to select a user-defined function to define the Energy Prandtl number for the standard and realizable k- ε models and the standard k- ω model when energy is enabled.

Wall Prandtl Number

allows you to select a user-defined function to define the Wall Prandtl number for the standard and realizable k- ε models and the standard k- ω model when energy is enabled.

SDR Prandtl Number

allows you to select a user-defined function to define the SDR Prandtl number for the standard k- ω model.

Subgrid-Scale Turbulent Viscosity

allows you to select a user-defined function for the subgrid-scale turbulent viscosity for the LES model.

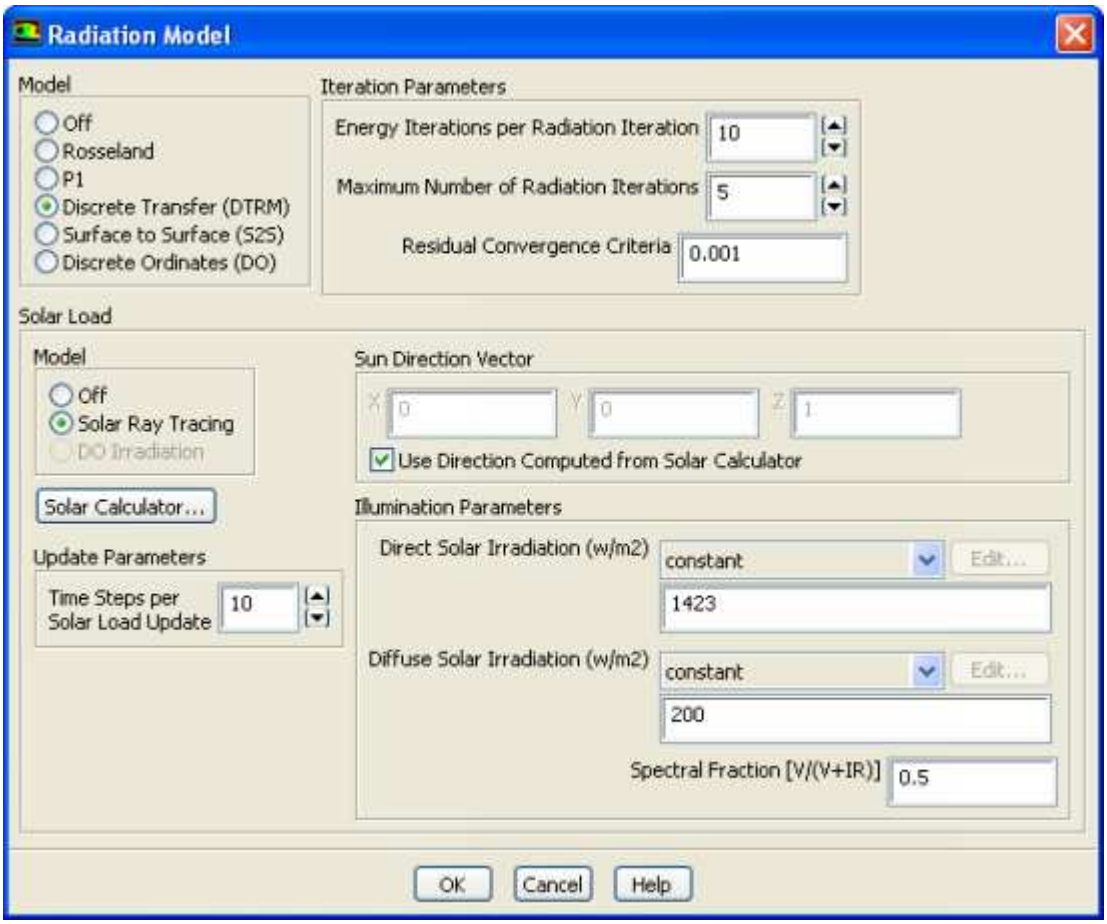
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Shielding Functions

allows you to select the shielding functions (**SST F1 Function**, **SST F2 Function**, **DDES**, and **IDDES**) for the SST Detached Eddy Simulation Model (see *Shielding Functions for the SST Detached Eddy Simulation Model* (p. 678) for details).

35.3.4. Radiation Model Dialog Box

The **Radiation Model** dialog box allows you to select a model for radiation heat transfer and set the associated parameters. See *Using the Radiation Models* (p. 705) – *Defining Non-Gray Radiation for the DO Model* (p. 721) for details about the items below.



Controls

Model

indicates which model, if any, is used to calculate radiation heat transfer. See *Modeling Radiation* (p. 704) for details about modeling radiation heat transfer.

Off

disables the calculation of radiation heat transfer.

Rosseland

enables the Rosseland radiation model.

P1

enables the P-1 radiation model.

Discrete Transfer (DTRM)

enables the discrete transfer radiation model (DTRM).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Surface to Surface (S2S)
enables the surface-to-surface (S2S) radiation model.

Discrete Ordinates (DO)
enables the discrete ordinates (DO) radiation model.

DO/Energy Coupling
allows you to couple the energy and DO intensity equations at each cell, solving them simultaneously. See *Defining Non-Gray Radiation for the DO Model* (p. 721) for details.

Iteration Parameters
contains parameters related to the DTRM, S2S and the DO models. This portion of the dialog box will appear only if **Discrete Transfer (DTRM)**, **Surface to Surface (S2S)**, or **Discrete Ordinates (DO)** is selected as the **Model**.

Flow Iterations per Radiation Iteration
controls the frequency with which the radiation terms are updated as the solution proceeds. It is set to 10 by default. This implies that the radiation calculation is performed once every 10 iterations of the solution process. Increasing the number can speed the calculation process, but may slow overall convergence. This appears for the **Discrete Transfer (DTRM)** and **Discrete Ordinates (DO)** models.

Number of DTRM Sweeps
controls the number of DTRM passes.

Tolerance
allows you to control the accuracy during each iteration.

Energy Iterations per Radiation Iteration
controls the frequency with which the radiation terms are updated as the continuous phase solution proceeds. The **Energy Iterations per Radiation Iteration** parameter is set to 10 by default. This implies that the radiation calculation is performed once every 10 iterations of the solution process. Increasing the number can speed the calculation process, but may slow overall convergence.

Maximum Number of Radiation Iterations
controls the maximum number of iterations of the radiation calculation during each global iteration. The default setting of 5 means that the radiosity will be updated up to 5 times. The actual number of iterations will be less if the residual convergence criterion is exceeded at any point during these iterations.

This item appears only when **Discrete Transfer** or **Surface to Surface** is selected as the **Model**.

Residual Convergence Criteria
determines when the radiation intensity update is converged. It is defined as the maximum normalized change in the surface intensity from one radiation iteration to the next (see *Equation 14–8* (p. 736)).

This item appears only when **Discrete Transfer** or **Surface to Surface** is selected as the **Model**.

View Factors and Clustering
contains parameters related to the S2S model. This portion of the dialog box will appear only if **Surface to Surface** is selected as the **Model**. See *Setting Up the S2S Model* (p. 709) for more information about the use of these parameters.

Settings...
opens the *View Factors and Clustering Dialog Box* (p. 1660), in which you can set parameters related to surface clusters and view factors.

Compute/Write/Read...
allows you to compute the view factors, write the computed view factors to a file, and read the file into ANSYS FLUENT. When you click **Compute/Write/Read...**, the *The **Select File** Dialog Box* (p. 33)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

will open so that you can specify a name for the file where ANSYS FLUENT should save the view factors after computing them.

Read Existing File...
opens the *The **Select File** Dialog Box* (p. 33), in which you can specify the file from which ANSYS FLUENT should read view factors.

Angular Discretization
contains parameters for angular discretization and pixelation for the DO model. This portion of the dialog box will appear only if **Discrete Ordinates** is selected as the **Model**. See *Setting Up the DO Model* (p. 720) for more information about the use of these parameters.

Theta Divisions, Phi Divisions
define the number of control angles used to discretize each octant of the angular space (see Figure 5.3: "Angular Coordinate System" in the Theory Guide).

Theta Pixels, Phi Pixels
are used to control the pixelation that accounts for any control volume overhang (see Figure 5.7: "Pixelation of Control Angle" in the Theory Guide and the figures and discussion preceding it).

Non-Gray Model
contains parameters related to the non-gray P-1 model or non-gray DO model. This portion of the dialog box will appear only if **P1** or **Discrete Ordinates** is selected as the **Model**. See *Setting Up the P-1 Model with Non-Gray Radiation* (p. 706) or *Defining Non-Gray Radiation for the DO Model* (p. 721) for more information about the use of these parameters.

Number of Bands
specifies the number of bands for the non-gray radiation.

Wavelength Intervals (n=1)
contains inputs that define each wavelength band. (It appears only when the **Number of Bands** is non-zero.) For each band, you can specify a **Name**, as well as the **Start** and **End** wavelength of the band in μm. Note that the wavelength bands are specified for vacuum ($n = 1$). ANSYS FLUENT will automatically account for the refractive index in setting band limits for media with n different from unity.

Solar Load
contains parameters related to solar load model that can be used to calculate radiation effects from the sun's rays that enter a computational domain. It is available only for the 3D version of ANSYS FLUENT. See *Solar Load Model* (p. 740) for more information about the use of these parameters.

Model
indicates which model is used to calculate radiation effects.

Off
disables the calculation of solar radiations.

Solar Ray Tracing
enables the solar ray tracing algorithm

DO Irradiation
enables the DO irradiation option. Select **Discrete Ordinates** under **Model** before selecting this option.

Solar Calculator
opens the *Solar Calculator Dialog Box* (p. 1665).

Sun Direction Vector
contains the components of sun direction vector.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X, Y, Z
are the components of the sun direction vector.

Use Direction Computed from Solar Calculator
enables the use of direction vector computed from the solar calculator.

Illumination Parameters
contains illumination options.

Direct Solar Irradiation
is the amount of energy per unit area due to direct solar irradiation.

Diffuse Solar Irradiation
is the amount of energy per unit area due to diffuse solar irradiation.

Spectral Fraction
is the fraction of incident solar radiation in the visible part of the solar radiation spectrum. The spectral fraction is not used for DO irradiation since the DO implementation is intended only for a single band. This parameter is available only for **Solar Ray Tracing**.

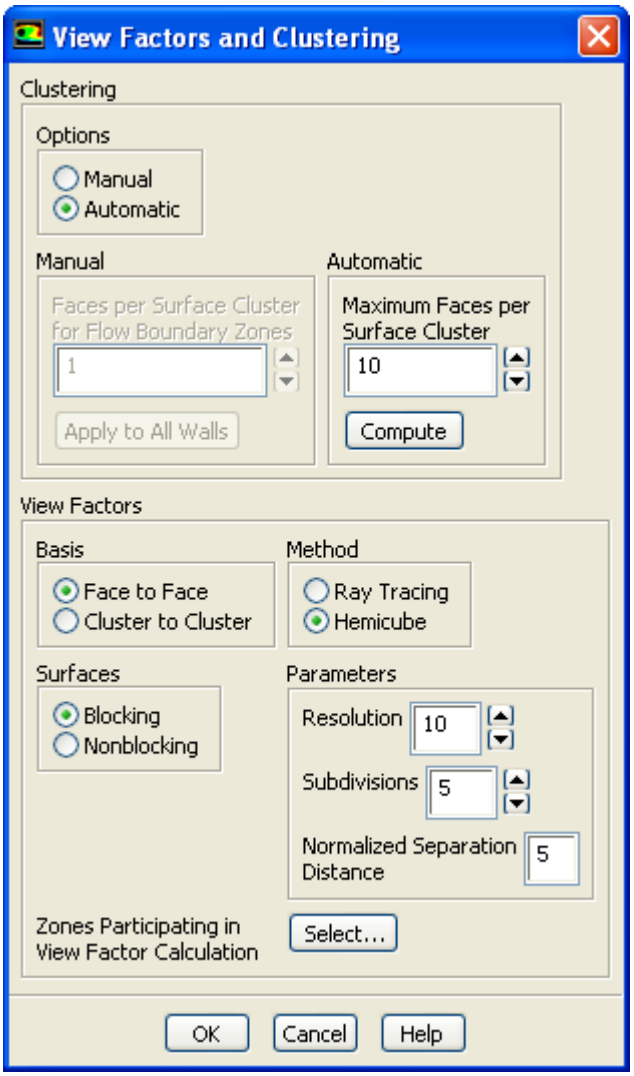
Update Parameters
contains update parameters for transient simulations.

Time Steps per Solar Load Update
specifies the number of time steps that will direct the ANSYS FLUENT solver to update the solar load data for the specified flow-time intervals in the unsteady solution process.

35.3.5. View Factors and Clustering Dialog Box

The **View Factors and Clustering** dialog box allows you to set parameters related to surface clusters and view factors for the surface-to-surface radiation model. See *Setting Up the S2S Model* (p. 709) for information about using this dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Clustering

contains the methods and settings for creating surface clusters. See *Forming Surface Clusters* (p. 711) for information about surface cluster settings.

Options

gives you a choice of forming clusters either manually or automatically.

Manual

allows you to form clusters manually.

Automatic

allows ANSYS FLUENT to form the cluster automatically.

Manual

(available only when the **Manual** option is enabled) allows you to set the faces per surface cluster (FPSC) value for walls and inlet and outlet boundaries.

Faces per Surface Cluster for Flow Boundary Zones

specifies the number of faces in each surface cluster for inlet and outlet boundaries (i.e., exhaust fan, inlet vent, intake fan, outlet vent, mass-flow inlet, pressure far-field, pressure inlet, pressure outlet, outflow, and velocity inlet boundaries). This FPSC value can also be applied to all walls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

that are adjacent to fluid zones by clicking the **Apply to All Walls** button. The default is set to 1. See Clustering in the Theory Guide for details about clustering.

Apply to All Walls
applies the value specified in the **Faces per Surface Cluster for Flow Boundary Zones** field to all walls that are adjacent to fluid zones.

Automatic
(available only when the **Automatic** option is enabled) allows you to assign different faces per surface cluster (FPSC) values to the walls automatically, based on the distance of the walls from and the FPSC values of the walls that are defined as critical.

Maximum Faces per Surface Cluster
specifies the maximum number of faces per surface cluster automatically assigned to non-critical wall zones adjacent to fluid zones. The default is set to 10.

Compute
results in ANSYS FLUENT automatically calculating and updating the face per surface cluster values in the boundary conditions dialog box for non-critical wall zones adjacent to fluid zones, without computing the clusters.

View Factors
contains settings for computing the view factors. See *Setting Up the View Factor Calculation* (p. 713) for information about view factor calculation settings.

Basis
specifies how surfaces are defined for the calculation of view factors. See *Selecting the Basis for Computing View Factors* (p. 713) for more information.

Face to Face
specifies that the surfaces used to calculate the view factors are the boundary faces.

Cluster to Cluster
specifies that the surfaces used to calculate the view factors are the clusters defined by the settings in the **Clustering** group box. The cluster to cluster basis is only available for 3D cases.

Surfaces
specifies the geometric orientation of surface pairs with respect to each other when using the hemicube method.

Blocking
specifies that the view factor calculation accounts for surfaces that block the views between the surfaces under consideration.

Nonblocking
specifies that the view factor calculation does not account for surfaces that block the views between the surfaces under consideration.

Method
specifies the method for computing the view factors. See *Selecting the Method for Computing View Factors* (p. 714) for information about choosing a method.

Hemicube
specifies the use of the hemicube method for computing the view factors. The hemicube method is available only for 3D and axisymmetric cases.

Ray Tracing

specifies the use of the ray tracing method for computing the view factors. For 2D cases, the number of rays used with this method is two times the value set for **Resolution** in the **Parameters** group box; for 3D cases, the number of rays is three times the square of the **Resolution** value.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The ray tracing method should not be used when any of the zones are defined as periodic. The ray tracing method is only available with the face to face basis.

Parameters

contains settings related to the hemicube and ray tracing methods for computing the view factors. All of these inputs are available when **Hemicube** is selected under **Method**, whereas only **Resolution** is available when **Ray Tracing** is selected. See *Selecting the Method for Computing View Factors* (p. 714) for information about setting the method parameters.

Resolution

specifies the resolution of the hemicube. The default value is set to `10`. You can increase the value to reduce aliasing effects that can lead to overestimated or underestimated view factors.

Subdivisions

specifies the number of subfaces into which each face is divided. The default value is set to 5. This parameter is only available when the hemicube method is used in conjunction with the face to face basis.

Normalized Separation Distance

specifies the ratio of the minimum face separation to the effective diameter of the face. The default value is set to 5. This parameter is only available for the hemicube method.

Zones Participating in View Factor Calculation

allows you to define which boundary zones participate in the view factor calculation. See *Specifying Boundary Zone Participation* (p. 715) for more information.

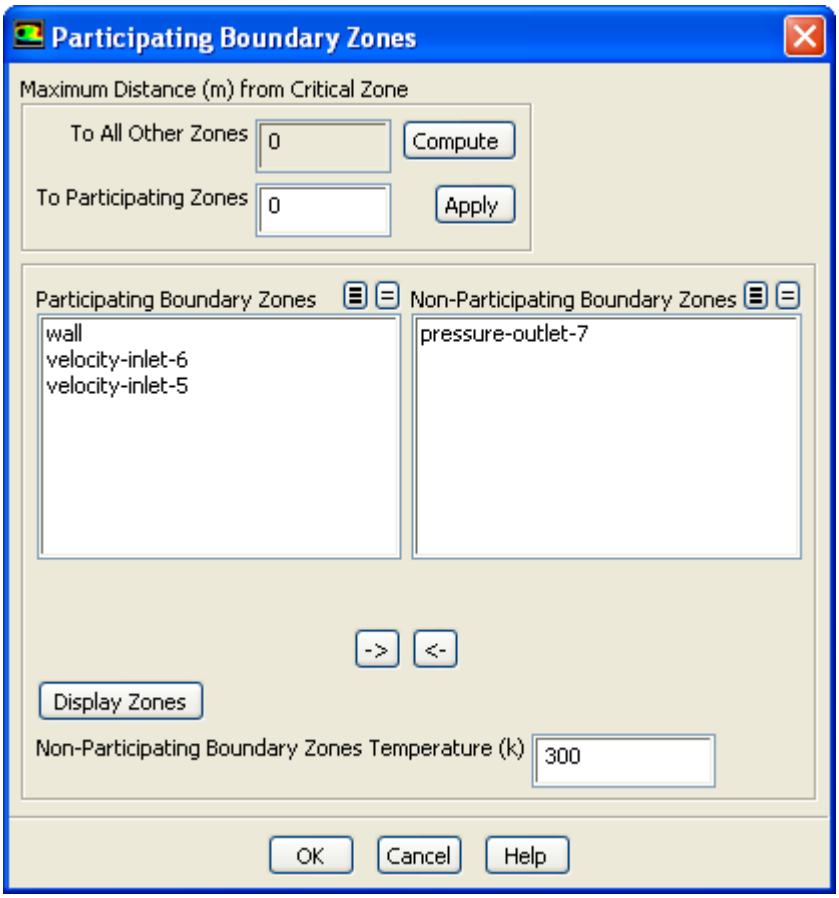
Select...

opens the *Participating Boundary Zones Dialog Box* (p. 1663), where you can define which boundary zones participate in the view factor calculation.

35.3.6. Participating Boundary Zones Dialog Box

The **Participating Boundary Zones** dialog box allows you to define which boundary zones participate in the view factor calculation, to display zones in the graphics window, and set the temperature of zones that do not participate in the view factor calculation. See *Specifying Boundary Zone Participation* (p. 715) for details. This dialog box opens when you click on the **Select...** button next to the **Zones Participating in View Factor Calculation** label in the **View Factors and Clustering** dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Maximum Distance from Critical Zone

allows you to view the maximum distance between critical zones and other zones, and set all boundary zones that are located beyond a certain distance from a critical zone as not participating in the view factor calculation.

To All Other Zones

displays the maximum of the distances between the centroids of critical and all other wall, inlet, and exit zones when the **Compute** button is clicked. This field is not editable. This is only available when using the **Automatic** option for clustering.

Compute

calculates the distances between the centroids of critical zones and all the other wall, inlet, and exit zones and displays the maximum value in the **To All Other Zones** field and the **To Participating Zones** text-entry box. It requires the definition of the critical zone.

To Participating Zones

displays the maximum of the distances between the centroids of critical and all other wall, inlet, and exit zones when the **Compute** button is clicked. Unlike the **To All Other Zones** field, you can edit this text-entry box. You can specify the maximum distance allowed between the centroids of critical zones and all other wall, inlet, or exit zones that participate in the view factor calculation; when you click the **Apply** button, all of the zones will be marked as either participating or not participating, according to the distance criteria you specified. Note that this field is only available when using the **Automatic** option for clustering.

Apply

marks all of the wall, inlet, and exit zones as either participating or not participating in the view factor calculation, depending on whether the distance from their centroid to the centroid of a critical

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

zone is equal to or less than value entered for **To Participating Zones**. The **Participating Boundary Zones** and **Non-Participating Boundary Zones** lists will be updated accordingly.

Participating Boundary Zones
shows all the zones that are participating in the view factor calculation. You can select a zone and click the arrow button that points to the left to move the zone to the **Non-Participating Boundary Zones** list.

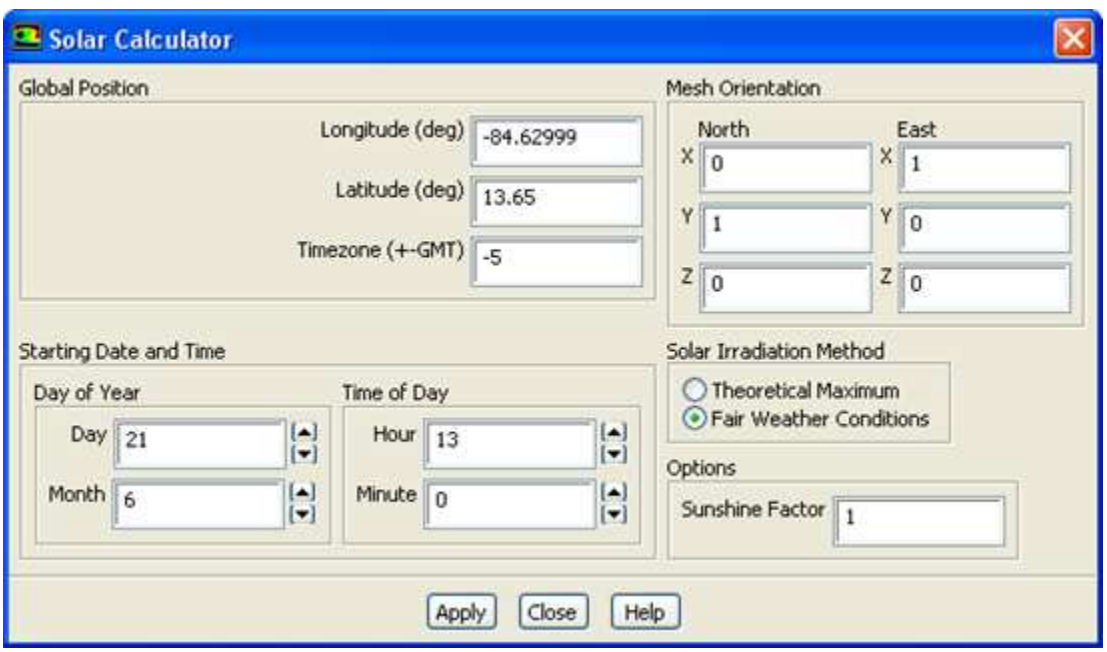
Non-Participating Boundary Zones
shows all the zones that are not participating in the view factor calculation. You can select a zone and click the arrow button that points to the right to move the zone to the **Participating Boundary Zones** list.

Display Zones
displays any zones selected in the **Participating Boundary Zones** and **Non-Participating Boundary Zones** lists in the graphics window.

Non-Participating Boundary Zones Temperature
allows you to specify the temperature of the zones that do not participate in the view factor calculation.

35.3.7. Solar Calculator Dialog Box

The **Solar Calculator** dialog box allows you to set parameters related to the calculation of solar load models. See *Solar Load Model* (p. 740) for details. This dialog box opens when you click on the **Solar Calculator...** button in the **Radiation Model** dialog box.



Controls

Global Position
contains the parameters to define the position of solar radiation.

Longitude
specifies the longitude of the desired location in degrees. Values may range from -180 to 180, where negative values indicate the Western hemisphere and positive values indicate the Eastern hemisphere.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Latitude
specifies the latitude of the desired location in degrees. Values may range from -90 (South pole) to 90 (North pole) with 0 defined as the equator.

Timezone
specifies the local time zone of the desired location in hours relative to Greenwich Mean Time (+-GMT). This integer value can range from 12 to -12.

Starting Date and Time
contains parameters to specify date and time.

Day of Year
contains parameters to specify day and month.

Time of Day
contains parameters to specify hour and minutes.

Mesh Orientation
specifies the orientation as the vectors for North and East in the CFD grid system of coordinates.

Solar Irradiation Method
contains parameters to choose the solar irradiation method.

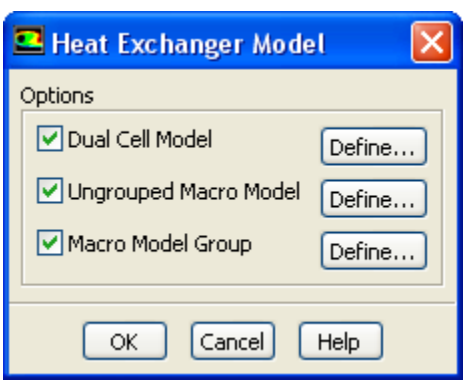
Theoretical Maximum
enables theoretically maximum solar irradiation method.

Fair Weather Conditions
enables fair weather condition solar irradiation method.

Sunshine Factor
is a linear reduction factor for the computed incident load that allows for cloud cover to be accounted for, if appropriate.

35.3.8. Heat Exchanger Model Dialog Box

The **Heat Exchanger Model** dialog box allows you to define a heat exchanger as part of your model. See *Modeling Heat Exchangers* (p. 769) for details about using the items below.



Controls

Options
contains options related to the heat exchanger model.

Dual Cell Model
allows you to enable or disable the Dual Cell heat exchanger model. When this option is enabled, the corresponding **Define...** button opens the *Dual Cell Heat Exchanger Dialog Box* (p. 1667).

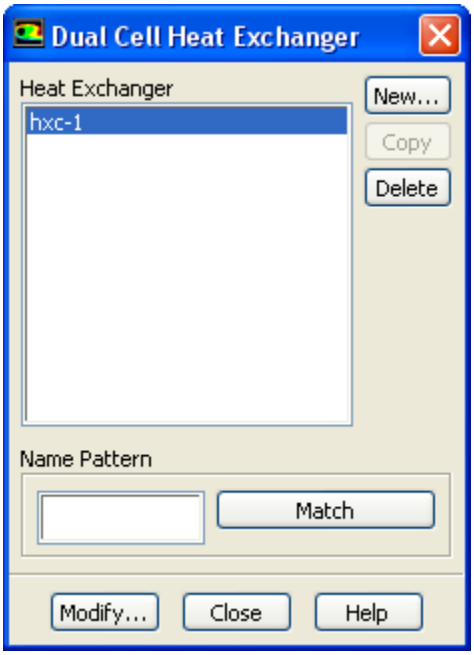
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Ungrouped Macro Model
allows you to enable or disable the Ungrouped Macro heat exchanger model. When this option is enabled, the corresponding **Define...** button opens the *Ungrouped Macro Heat Exchanger Dialog Box* (p. 1672).

Macro Model Group
allows you to enable or disable the Macro heat exchanger group model. When this option is enabled, the corresponding **Define...** button opens the *Macro Heat Exchanger Group Dialog Box* (p. 1677).

35.3.9. Dual Cell Heat Exchanger Dialog Box

The **Dual Cell Heat Exchanger** dialog box allows you to use the NTU method for heat transfer calculations. This model allows the solution of auxiliary flow on a separate mesh (other than the primary fluid mesh). See *Using the Dual Cell Heat Exchanger Model* (p. 787) for information about using this dialog box.



Controls

Heat Exchanger
contains a list of predefined heat exchangers.

New...
opens the *Set Dual Cell Heat Exchanger Dialog Box* (p. 1668).

Copy
opens the *Copy From Dialog Box* (p. 1672), which allows you to copy the currently selected heat exchanger.

Delete
removes the currently selected heat exchanger.

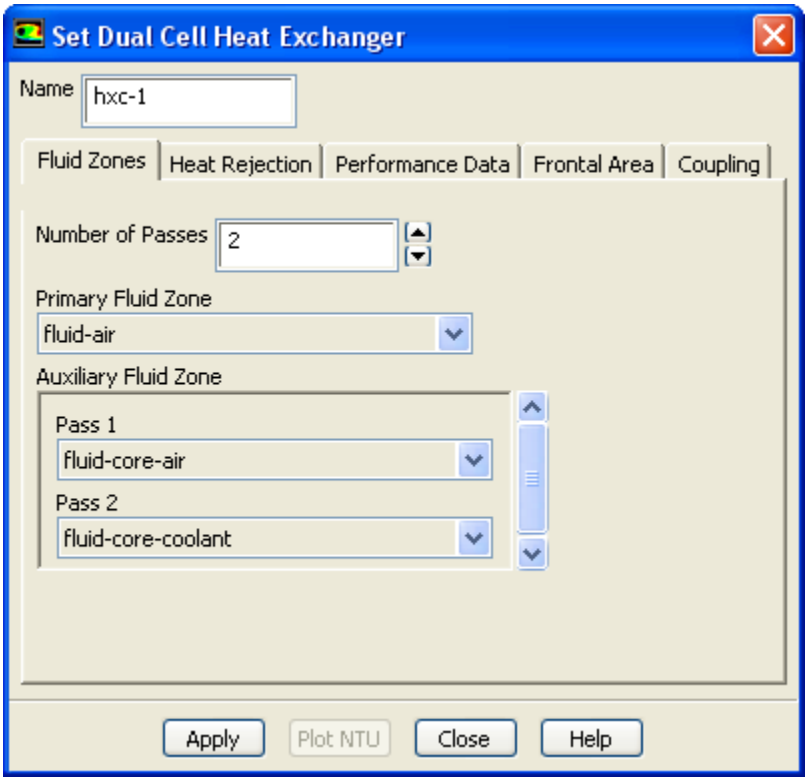
Name Pattern
specifies the pattern to look for in the names of heat exchangers. Type the pattern in the text field and click **Match** to select (or deselect) the listing in the **Heat Exchanger** list with names that match the specified pattern.

Modify...
opens the *Set Dual Cell Heat Exchanger Dialog Box* (p. 1668).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.3.10. Set Dual Cell Heat Exchanger Dialog Box

The **Set Dual Cell Heat Exchanger** dialog box allows you to define the heat exchanger parameters. See *Using the Dual Cell Heat Exchanger Model* (p. 787) for details about using this dialog box.



Controls

Name
allows you to specify a name for the dual cell heat exchanger.

Fluid Zones
allows you to specify the fluid zone parameters for the heat exchanger.

Number of Passes
specifies the number of passes for the heat exchanger.

Primary Fluid Zone
allows you to specify the fluid of the primary fluid zone for the heat exchanger.

Auxiliary Fluid Zone
allows you to specify the fluid for the auxiliary fluid zone, per pass.

Important

The selected zones must be overlapping in physical space.

Heat Rejection
contains parameters specific to the rejection of heat in the heat exchanger.

Options
allows you to specify how the heat rejection in the heat exchanger is computed.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Fixed Heat Rejection
allows you to specify heat rejection parameters.

Fixed Inlet Temperature
allows you use total heat rejection as the desired output.

Heat Rejection Targeted
allows you to specify the heat rejection desired from the heat exchanger (available only when the **Fixed Heat Rejection** option is enabled).

Inlet Zone for Temperature Updates
allows ANSYS FLUENT to change the temperature of the specified inlet zone in order to match the targeted heat rejection (available only when the **Fixed Heat Rejection** option is enabled).

Temperature Update Under-Relaxation
controls convergence (available only when the **Fixed Heat Rejection** option is enabled).

Iteration Interval Between Temperature Updates
controls divergence (available only when the **Fixed Heat Rejection** option is enabled).

Performance Data
contains parameters for specifying the heat exchanger's performance data.

Options
allows you to choose between using raw performance data or NTU performance data.

Raw Data
allows you to specify raw performance data for the heat exchanger.

NTU Data
allows you to specify NTU performance data for the heat exchanger.

Heat Exchanger Performance Data
contains parameters concerning the heat exchanger's performance data.

NTU Table
opens the *NTU Table Dialog Box* (p. 1671) (available only when the **NTU Data** option is enabled).

Heat Transfer Table
opens the *Heat Transfer Data Table Dialog Box* (p. 1670) (available only when the **Raw Data** option is enabled).

Effectiveness-NTU Relation
computes the NTU values from the heat transfer data. Choose **cross-flow-unmixed**, **parallel-flow**, or **counter-flow**, all of which are described in NTU Relations (available only when the **Raw Data** option is enabled).

Reference Inlet Temperature
allows you to specify the inlet reference temperature for the primary and the auxiliary fluids. (available only when the **Raw Data** option is enabled).

Frontal Area
allows you to specify the frontal area for the heat exchanger.

Primary Fluid
allows you to specify a value for the **Core Frontal Area** for the primary fluid, or to compute the value from a surface zone using the **Compute From** drop-down list.

Auxiliary Fluid
allows you to specify a value for the **Core Frontal Area** for the auxiliary fluid, or to compute the value from a surface zone using the **Compute From** drop-down list.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Coupling

specifies parameters when you want to couple the heat exchanger passes.

Temperature

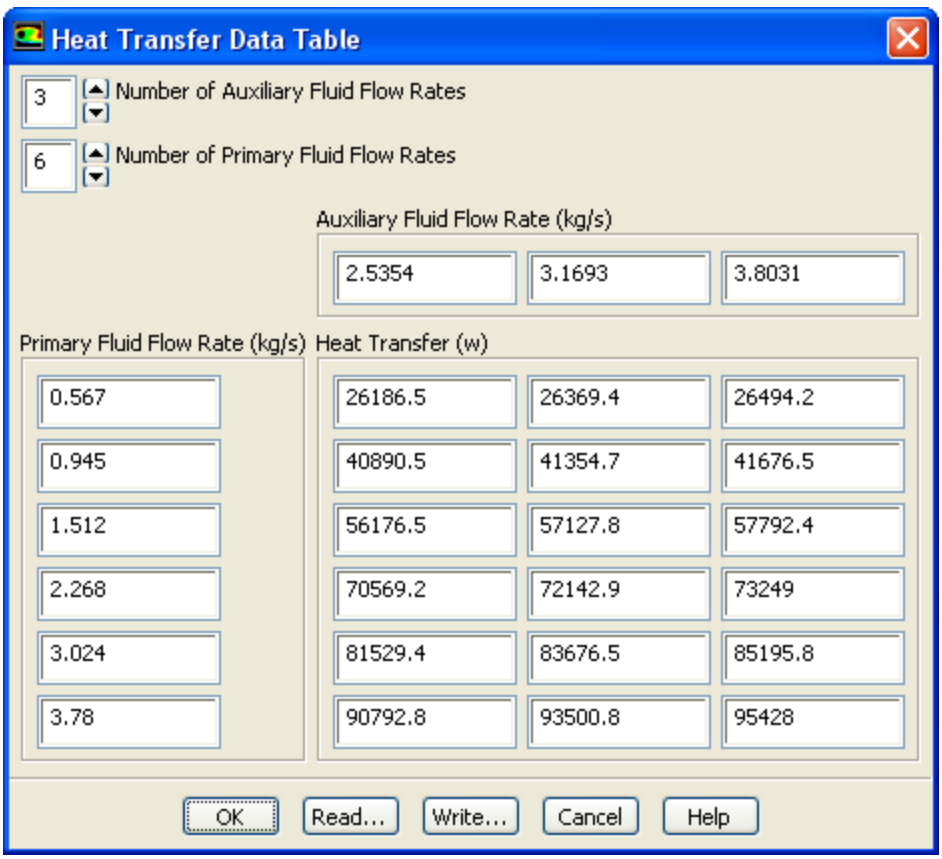
specifies, by default, the mass-weighted average for the temperature of the outlet of Pass 1 to the inlet of Pass 2. Similarly, the mass-weighted-average temperature of the outlet of Pass 2 will be applied at the inlet zone of Pass 3, and so on. (available only when multiple passes are specified in the **Fluid Zones** tab).

Plot NTU

plots the performance data curve for the selected heat exchanger. The performance data is supplied through the **Performance Data** tab.

35.3.11. Heat Transfer Data Table Dialog Box

The **Heat Transfer Data Table** dialog box contains information on the number of fluid flow rates and heat transfer data for the primary and auxiliary fluids. See *Using the Ungrouped Macro Heat Exchanger Model* (p. 771) for details about using this dialog box.



Controls

Number of Auxiliary Fluid Flow Rates

sets the number of auxiliary fluid flow rates.

Number of Primary Fluid Flow Rates

sets the number of primary fluid flow rates.

Auxiliary Fluid Flow Rate

sets fluid flow rates for the auxiliary fluid.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Primary Fluid Flow Rate
sets fluid flow rates for the primary fluid.

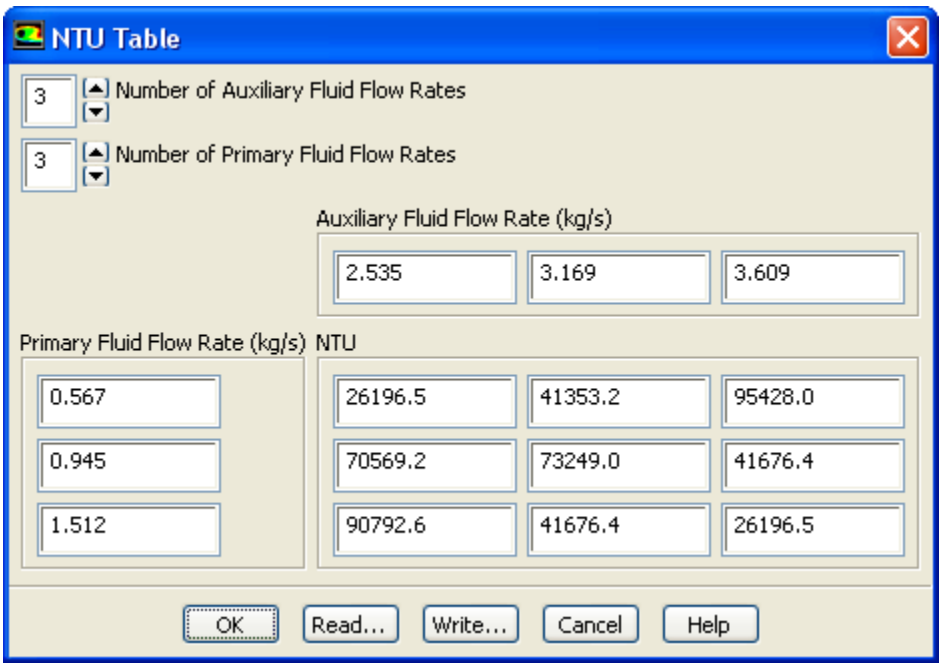
Heat Transfer
sets the heat transfer for the corresponding primary and auxiliary fluid flow rates.

Read...
allows you to read in a file containing heat transfer data.

Write...
allows you to write a file containing heat transfer data.

35.3.12. NTU Table Dialog Box

The **NTU Table** dialog box contains information on the number of fluid flow rates and NTU data for the primary and auxiliary fluids. See *Using the Ungrouped Macro Heat Exchanger Model* (p. 771) for details about using this dialog box.



Controls

Number of Auxiliary Fluid Flow Rates
sets the number of auxiliary fluid flow rates.

Number of Primary Fluid Flow Rates
sets the number of primary fluid flow rates.

Auxiliary Fluid Flow Rate
sets fluid flow rates for the auxiliary fluid.

Primary Fluid Flow Rate
sets fluid flow rates for the primary fluid.

NTU
sets the NTU values for the corresponding primary and auxiliary fluid flow rates.

Read...
allows you to read in a file containing NTU data.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Write...
allows you to write a file containing NTU data.

35.3.13. Copy From Dialog Box

The **Copy From** dialog box allows you to copy the setup of one heat exchanger to another.

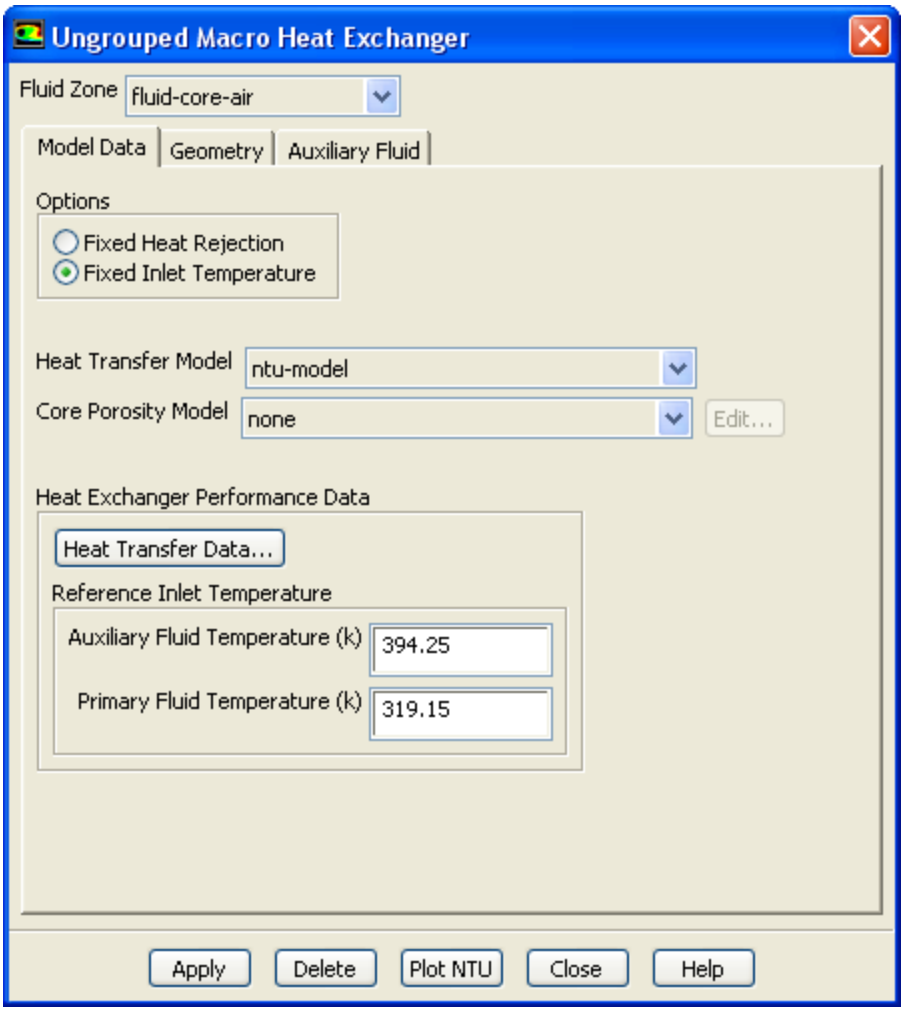
Controls

Existing Heat Exchangers
contains a list of heat exchangers, from which you can copy the settings from one heat exchanger to another.

35.3.14. Ungrouped Macro Heat Exchanger Dialog Box

The **Ungrouped Macro Heat Exchanger** dialog box allows you to set up the ungrouped macro heat exchanger model. See *Using the Ungrouped Macro Heat Exchanger Model* (p. 771) for details about using this dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Fluid Zone

specifies the zone that represents the heat exchanger.

Model Data

contains the parameters related to the heat exchanger model.

Options

allows you to choose one of the following settings:

Fixed Heat Rejection

specifies that ANSYS FLUENT should compute the auxiliary fluid inlet temperature for a specified heat rejection.

Fixed Inlet Temperature

specifies that ANSYS FLUENT should compute the total heat rejection of the core for a given inlet auxiliary temperature.

Heat Transfer Model

allows you to specify either the **ntu-model** or the **simple-effectiveness-model** for heat transfer.

Core Porosity Model

contains a drop-down list of all available core porosity models.

Edit...

opens the *Core Porosity Model Dialog Box* (p. 1676).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Heat Exchanger Performance Data
contains the parameters for heat transfer.

Heat Transfer Data...
opens the *Heat Transfer Data Table Dialog Box* (p. 1670). This item will appear for the NTU model only.

Auxiliary Fluid Temperature
specifies the auxiliary fluid temperature. This item will appear only for the NTU model.

Primary Fluid Temperature
specifies the gas stream temperature. This item will appear only for the NTU model.

Velocity Effectiveness Curve...
opens the *Velocity Effectiveness Curve Dialog Box* (p. 1675) in which you can define the effectiveness of the heat exchanger core (ε in Equation 6–11 in the Theory Guide). This item will appear for simple effectiveness model only.

Geometry
contains parameters to define the macro grid.

Width
sets the width of the heat exchanger core. The **Width** is measured in the pass-to-pass direction.

Height
sets the height of the heat exchanger core. The **Height** is measured in the auxiliary fluid inlet direction.

Depth
sets the depth of the heat exchanger core.

Number of Passes
specifies the number of passes for the macro grid. (See *Figure 15.6* (p. 777).)

Number of Rows/Pass, Number of Columns/Pass
specify the number of macro rows and columns per pass in the macro grid. (See *Figure 15.6* (p. 777).)

View Passes
displays the macro grid. (This button becomes available after you click **Apply**.) The path of the auxiliary fluid is color-coded in the display: macro 0 is red and macro $n-1$ is blue.

Draw Mesh
toggles between displaying and not displaying the mesh when the macro mesh is displayed (using the **View Passes** button). The *Mesh Display Dialog Box* (p. 1635) opens when **Draw Mesh** is selected.

Update from Plane Tool
updates the **Auxiliary Fluid Inlet Direction** and **Pass-to-Pass Direction** from the plane tool orientation. The **Width**, **Height**, and **Depth** will also be updated. See *Using the Plane Tool* (p. 1367) for information about using the plane tool.

Auxiliary Fluid Inlet Direction (height)
specifies the direction in which the auxiliary fluid enters the heat exchanger. See *Figure 15.6* (p. 777).

Pass-to-Pass Direction (width)
specifies the direction in which the auxiliary fluid moves at the end of each pass through the heat exchanger. See *Figure 15.6* (p. 777).

Auxiliary Fluid
contains the option to specify the auxiliary fluid properties.

Auxiliary Fluid Properties Method
contains options for specifying auxiliary fluid properties.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

constant-specific-heat
allows you to specific a constant value for the auxiliary fluid specific heat.

user-defined-enthalpy
allows you to specify a user-defined function for the auxiliary fluid enthalpy.

Auxiliary Fluid Specific Heat
specifies the value of $c_{p,auxiliary}$ in Equation 6–17 in the Theory Guide. This value is specified only if **constant-specific-heat** is selected.

Auxiliary Fluid Enthalpy UDF
allows you to specify a UDF for the auxiliary fluid enthalpy (see Equation 6–17 in the Theory Guide). This option is available only when **user-defined-enthalpy** is selected.

Auxiliary Fluid Flow Rate
sets the flow rate of the auxiliary fluid ($\dot{m}$ in Equation 6–16 in the Theory Guide).

Heat Rejection
sets the total heat rejection (q_{total} in Equation 6–15 in the Theory Guide). This value is specified only if **Fixed Heat Rejection** is selected.

Initial Temperature
sets an initial guess for the inlet temperature (T_{in} in Equation 6–11 and Equation 6–16 in the Theory Guide). This value is specified only if **Fixed Heat Rejection** is selected.

Inlet Temperature
sets the auxiliary fluid initial temperature (T_{in} in Equation 6–11 and Equation 6–16 in the Theory Guide). This value is specified only if **Fixed Inlet Temperature** is selected in the **Model Data** tab.

Inlet Pressure
sets the auxiliary fluid inlet pressure. This value is specified only if **user-defined-enthalpy** is selected.

Inlet Quality
specifies the value of x in Equation 6–20 in the Theory Guide. This value is specified only if **user-defined-enthalpy** is selected.

Pressure Drop
specifies the value of p_{in} in Equation 6–21 in the Theory Guide. This value is specified only if **user-defined-enthalpy** is selected.

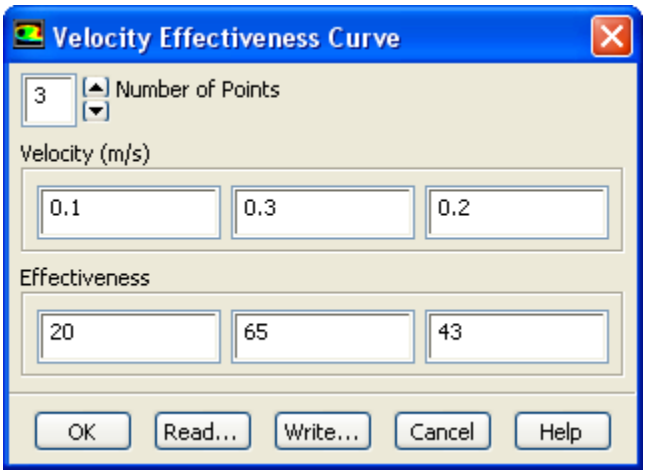
Apply
saves all the settings for the heat exchanger specified in the **Fluid Zone** list.

Delete
deletes the heat exchanger specified in the **Fluid Zone** list.

35.3.15. Velocity Effectiveness Curve Dialog Box

The **Velocity Effectiveness Curve** dialog box allows you to define effectiveness curve. It is opened by clicking **Velocity Effectiveness Curve...** in the *Ungrouped Macro Heat Exchanger Dialog Box* (p. 1672).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Number of Points

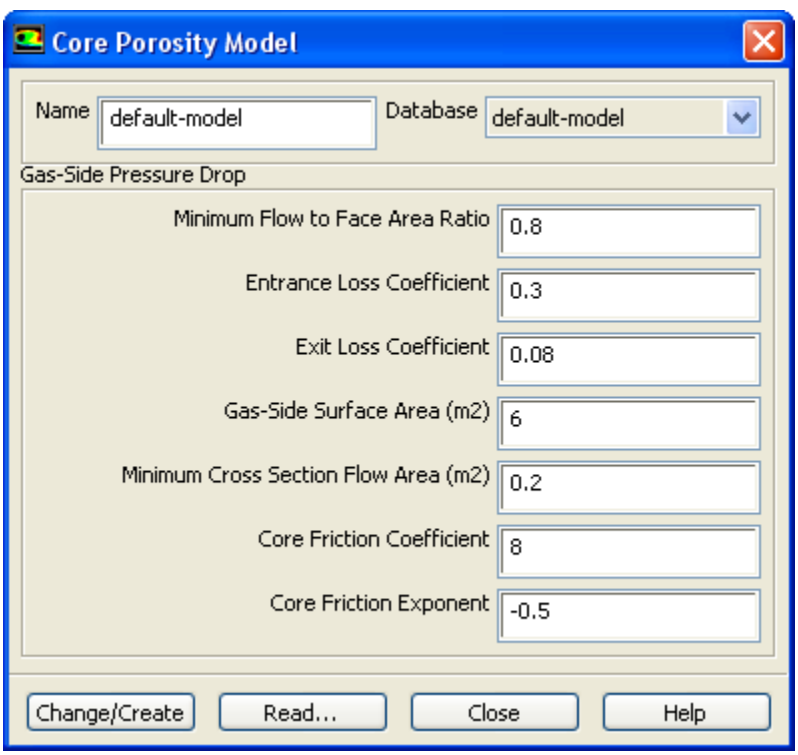
specifies the number of data pairs in the effectiveness profile. The default value of 1 indicates a constant effectiveness.

Velocity, Effectiveness

specify the data pairs for the effectiveness profile. These items are available only if the simple effective model has been selected.

35.3.16. Core Porosity Model Dialog Box

The **Core Porosity Model** dialog box allows you to modify or define a heat exchanger core model. This dialog box opens when you click **Edit...** in the *Ungrouped Macro Heat Exchanger Dialog Box* (p. 1672).



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name
specifies the name of a new heat exchanger core model.

Database
contains a drop-down list of all heat exchanger core models that are currently available.

Gas-Side Pressure Drop
contains parameters that define the air-side pressure drop.

Minimum Flow to Face Area Ratio
sets the value of σ in Equation 6–2 in the Theory Guide.

Entrance Loss Coefficient
sets the value of K_c in Equation 6–2 in the Theory Guide.

Exit Loss Coefficient
sets the value of K_e in Equation 6–2 in the Theory Guide.

Gas Side Surface Area
sets the value of A in Equation 6–2 in the Theory Guide.

Minimum Cross Section Flow Area
sets the value of A_c in Equation 6–2 in the Theory Guide.

Core Friction Coefficient
sets the value of a in Equation 6–3 in the Theory Guide.

Core Friction Exponent
sets the value of b in Equation 6–3 in the Theory Guide.

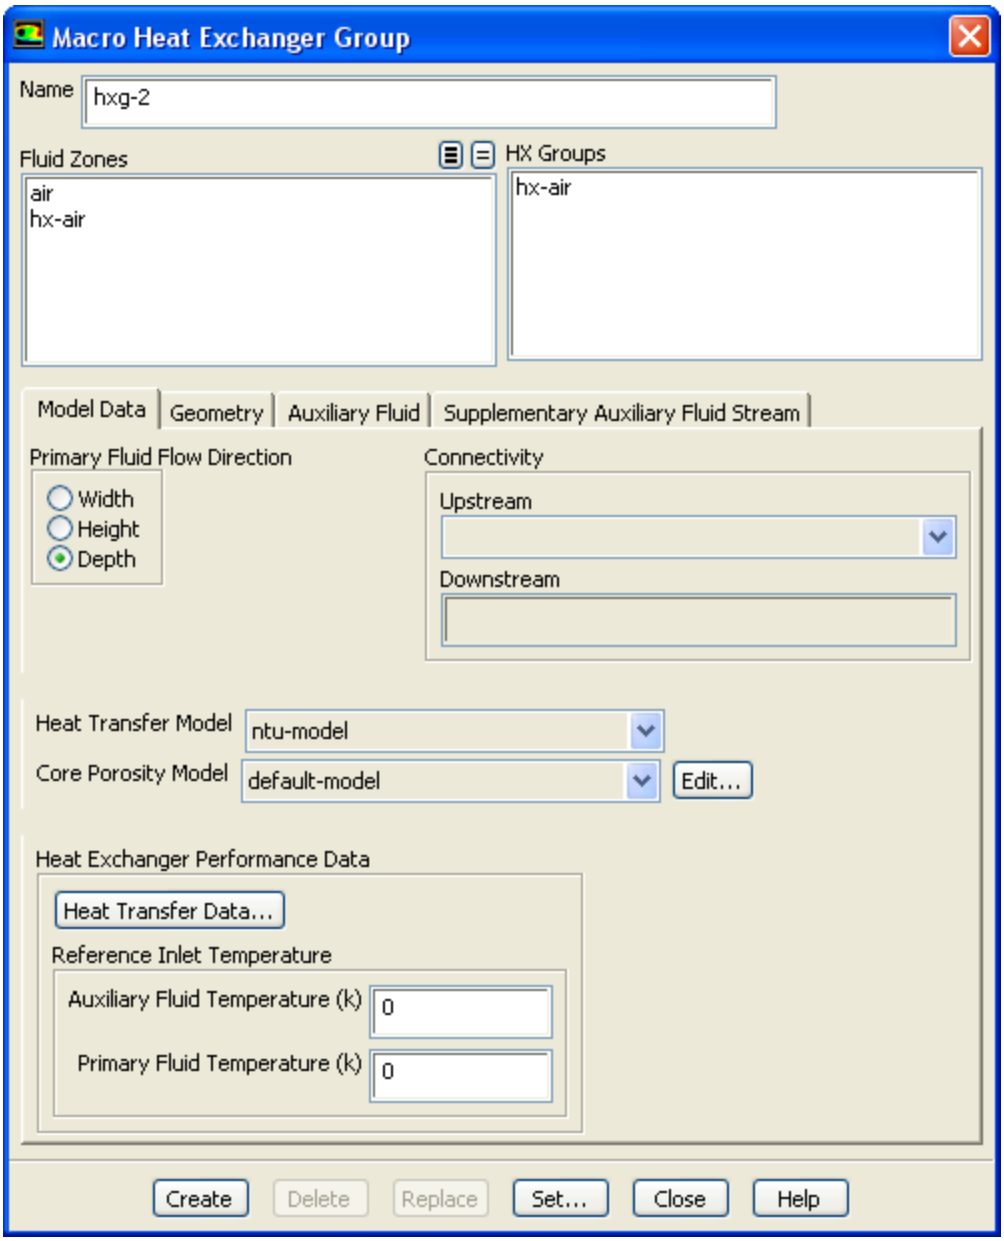
Change/Create
saves the settings in the dialog box and adds the new model to the **Database** list.

Read...
opens the *The **Select File** Dialog Box* (p. 33), in which you can select an external file containing a predefined heat exchanger core model.

35.3.17. Macro Heat Exchanger Group Dialog Box

The **Macro Heat Exchanger Group** dialog box allows you to modify or define a heat exchanger core group.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of a new heat exchanger group.

Fluid Zones

contains a list of all the fluid zones.

HX Groups

contains list of the heat exchanger groups.

Model Data

contains all the parameters to be specified for the model.

Primary Fluid Flow Direction

gives you a choice of gas flow direction.

Width, Height, Depth

specifies the width, height and the depth of the gas flow direction.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Connectivity
allows you to define the upstream and downstream connections.

Upstream
specifies the upstream heat exchanger group.

Downstream
specifies the downstream heat exchanger group.

Heat Transfer Model
allows you to select either the **simple-effectiveness-model** or the **ntu-model**.

Core Porosity Model
specifies whether default values are chosen for the core porosity model.

Edit...
opens the *Core Porosity Model Dialog Box* (p. 1676) for the definition of a new core porosity model.

Heat Exchanger Performance Data
contains the parameters for heat transfer.

Heat Transfer Data...
opens the *Heat Transfer Data Table Dialog Box* (p. 1670). This dialog box allows you to define the heat transfer for different primary and auxiliary fluid flow rates. This item will appear for the NTU model only.

Velocity Effectiveness Curve...
opens the *Velocity Effectiveness Curve Dialog Box* (p. 1675)in which you can define the effectiveness of the heat exchanger core (ε in Equation 6–11 in the Theory Guide). This item will appear for simple effectiveness model only.

Auxiliary Fluid Temperature
specifies the auxiliary fluid temperature. This item will appear for the NTU model only.

Primary Fluid Temperature
specifies the gas stream fluid temperature. This item will appear for the NTU model only.

Geometry
contains parameters to define the macro grid.

Width, Height, Depth
specifies the width, height and the depth of the heat exchanger.

Number of Passes
specifies the number of passes.

Number of Rows/Pass
specifies the number of rows per pass.

Number of Columns/Pass
specifies the number of columns per pass.

View Passes
displays the macro grid. (This button becomes available after you click **Set**.) The path of the auxiliary fluid is color-coded in the display: macro 0 is red and macro $n-1$ is blue.

Draw Mesh
toggles between displaying and not displaying the mesh when the macro mesh is displayed (using the **View Passes** button). The *Mesh Display Dialog Box* (p. 1635) opens when **Draw Mesh** is selected.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Update from Plane Tool
updates the **Auxiliary Fluid Inlet Direction** and **Pass-to-Pass Direction** from the plane tool orientation. The **Width**, **Height**, and **Depth** will also be updated. See *Using the Plane Tool* (p. 1367) for information about using the plane tool.

Auxiliary Fluid Inlet Direction
specifies the direction in which the auxiliary fluid enters the heat exchanger. See *Figure 15.6* (p. 777).

Pass-to-Pass Direction
specifies the direction in which the auxiliary fluid moves at the end of each pass through the heat exchanger. See *Figure 15.6* (p. 777).

Auxiliary Fluid
contains inputs to specify the properties of the auxiliary fluid.

Properties Method
specifies the method to specify the auxiliary fluid properties. You can choose from **constant-specific-heat** and **user-defined-enthalpy**.

Specific Heat
sets the specific heat of the auxiliary fluid (c_p in Equation 6–16 you choose **constant-specific-heat**.

Enthalpy UDF
sets the enthalpy as defined by the UDF selected from the drop-down list.

Auxiliary Fluid Flow Rate
sets the flow rate of the auxiliary fluid ($\dot{m}$ in Equation 6–16 in the Theory Guide).

Initial Temperature
sets an initial guess for the inlet temperature (T_{in} in Equation 6–11 and Equation 6–16 in the Theory Guide). This value is specified only if **Fixed Heat Rejection** is selected.

Inlet Pressure
sets the auxiliary fluid inlet pressure. This value is specified only if **user-defined-enthalpy** is selected.

Inlet Quality
specifies the value of x in Equation 6–20 in the Theory Guide.

Pressure Drop
specifies the value of p_{in} in Equation 6–21 in the Theory Guide. This value is specified only if **user-defined-enthalpy** is selected.

Supplementary Auxiliary Fluid Stream
specifies properties of the supplementary auxiliary stream.

Supplementary Mass Flow Rate
specifies the supplementary fluid flow rate as **constant**, **polynomial** or **piecewise-linear**.

Supplementary Flow Temperature
specifies the supplementary fluid temperature as **constant**, **polynomial** or **piecewise-linear**.

Supplementary Flow Quality
specifies the supplementary fluid quality.

Create
saves all the settings in the dialog box.

Delete
deletes the group that is selected in the **HX Groups** list.

Replace
changes the parameters of the already existing group that is selected in the **HX Groups** list.

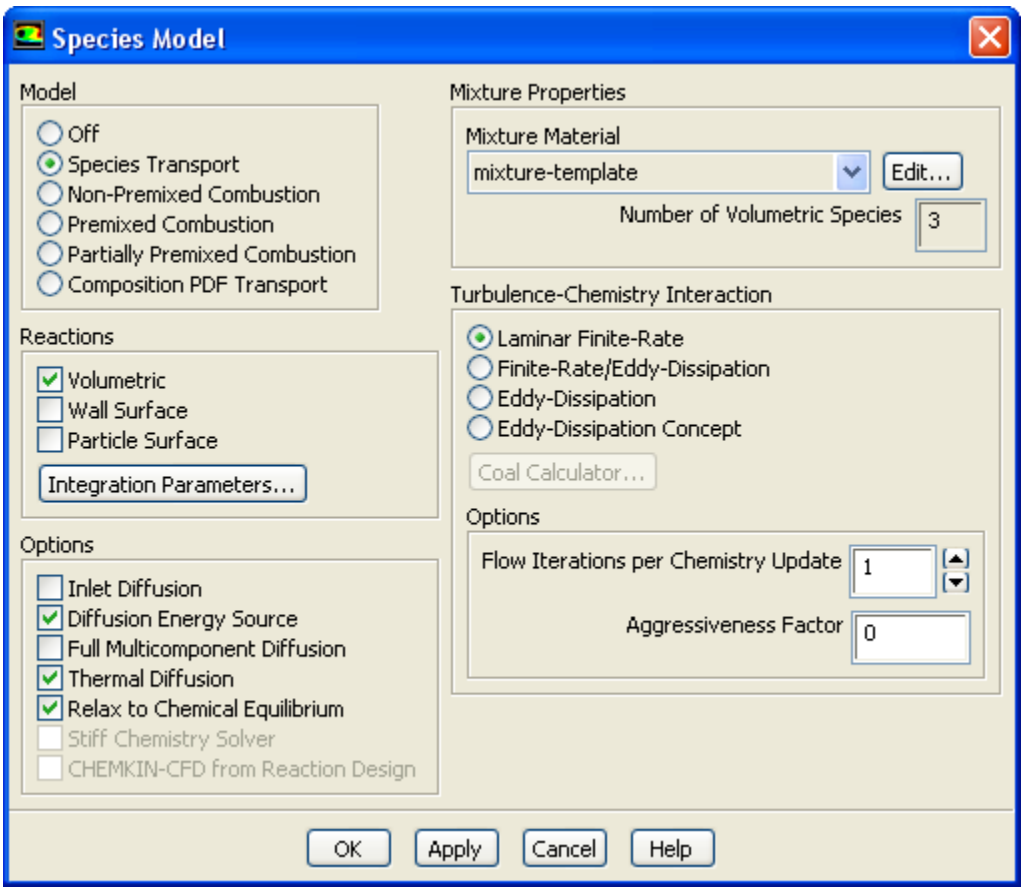
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Set...

opens the *Ungrouped Macro Heat Exchanger Dialog Box* (p. 1672), in which you can define a new heat exchanger core model or read one from an external file.

35.3.18. Species Model Dialog Box

The **Species Model** dialog box allows you to set parameters related to the calculation of species transport and combustion. See *Enabling Species Transport and Reactions and Choosing the Mixture Material* (p. 801), *User Inputs for Wall Surface Reactions* (p. 829), *User Inputs for Particle Surface Reactions* (p. 835), *Using the Premixed Combustion Model* (p. 894), *Using the Partially Premixed Combustion Model* (p. 905), and *Steps for Using the Composition PDF Transport Model* (p. 911) for details about the items below.



Controls

Model

indicates which model, if any, is used to calculate species transport/combustion.

Off

disables species calculations.

Species Transport

enables the calculation of multi-species transport (either non-reacting or reacting, depending on the selection for **Reactions**). See *Modeling Species Transport and Finite-Rate Chemistry* (p. 799) for details.

Non-Premixed Combustion

enables the calculation of turbulent reacting flow using the non-premixed combustion model. See *Modeling Non-Premixed Combustion* (p. 839) for details. This option is available only for turbulent flows using the pressure-based solver.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Premixed Combustion
enables the premixed turbulent combustion model. See *Modeling Premixed Combustion* (p. 893) for details. This option is available only for turbulent flows using the pressure-based solver.

Partially Premixed Combustion
enables the partially premixed turbulent combustion model. See *Modeling Partially Premixed Combustion* (p. 905) for details. This option is available only for turbulent flows using the pressure-based solver.

Composition PDF Transport
enables the composition PDF transport model. See *Modeling a Composition PDF Transport Problem* (p. 911) for details. This option is available only for turbulent flows using the pressure-based solver.

Reactions
contains options related to the modeling of reacting flow. (This section of the dialog box appears only when **Species Transport** or **Composition PDF Transport** is the specified **Model**.)

Volumetric
enables the calculation of reacting flow using the finite-rate formulation. See *Volumetric Reactions* (p. 799) for details.

Wall Surface
enables the calculation of wall surface reactions. See *Wall Surface Reactions and Chemical Vapor Deposition* (p. 829) for details. This item will appear only if **Volumetric** is enabled.

Particle Surface
enables the calculation of particle surface reactions. See *Particle Surface Reactions* (p. 835) for details. This item will appear only if **Volumetric** is enabled.

Integration Parameters...
is a command button that opens the *Integration Parameters Dialog Box* (p. 1694). This button appears for the species transport model, when **Volumetric** is enabled under **Reactions** and **Stiff Chemistry Solver** is enabled under **Options** or when **Eddy-Dissipation Concept** is enabled under **Turbulence-Chemistry Interaction**.

Wall Surface Reaction Options
contains additional options for wall surface reactions. This portion of the dialog box appears only if **Wall Surface** is enabled under **Reactions**.

Heat of Surface Reactions
(if enabled) includes the heat release due to surface reactions in the energy equation. You must remember to set appropriate formation enthalpies (standard state enthalpies) if you enable this option.

Mass Deposition Source
(if enabled) includes the effect of surface mass transfer in the continuity equation.

Aggressiveness Factor
is a numerical factor which controls the robustness and the convergence speed. This value ranges between 0 and 1, where 0 (the default) is the most robust, but results in the slowest convergence.

Options
contains additional options for the **Species Transport** model and for the **Composition PDF Transport**. (This section will not appear in the dialog box for the other models.)

Inlet Diffusion
includes the diffusion flux of species at inlet.

Diffusion Energy Source
(if enabled) includes the effect of enthalpy transport due to species diffusion in the energy equation.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Full Multicomponent Diffusion
enables the full multicomponent diffusion model. See *Full Multicomponent Diffusion* (p. 440) for details.

Thermal Diffusion
enables the thermal diffusion model. See *Thermal Diffusion Coefficients* (p. 442) for details.

Relax to Chemical Equilibrium
enables the calculation of the characteristic time for the turbulence-chemistry interaction models. See The Relaxation to Chemical Equilibrium Model for details.

Stiff Chemistry Solver
enables the calculations for modeling stiff laminar flames. See *Solution of Stiff Laminar Chemistry Systems* (p. 824) for details.

Liquid Micro-Mixing
is used to model liquid reactions. When the **Liquid Micro-Mixing** model is invoked, ANSYS FLUENT uses the **volume-weighted-mixing-law** formula to calculate the density.

CHEMKIN-CFD From Reaction Design
enables the use of reaction rates-of-production from Reaction Design's CHEMKIN module, coupled to ANSYS FLUENT's ISAT algorithm.

Thickened Flame Model
enables the modeling of laminar flames. This application is typically used as an LES combustion model for turbulent premixed and partially-premixed flames.

Include Temperature Fluctuations
enables the calculation of the multi-mode energy equation. This option is available when the composition PDF transport model is selected.

Mixture Properties
contains controls and information about the mixture being modeled. This section of the dialog box will not appear if **Premixed Combustion** is the selected under **Model**.

Mixture Material
contains a drop-down list of available mixture materials. When you first enable the **Species Transport** model, you can choose from all of the mixture materials defined in the database, or you can choose a "template" and define your own material. (Click **View...** to open the *FLUENT Database Materials Dialog Box* (p. 1744) and check the properties of the mixture material selected in the list.) See *Enabling Species Transport and Reactions and Choosing the Mixture Material* (p. 801) for details.

When you use the **Non-Premixed Combustion** or **Partially Premixed Combustion** model, this list will be inactive. The mixture material for a non-premixed or partially premixed combustion calculation will be determined from the content of the PDF file generated in ANSYS FLUENT using the **PDF Options** parameters.

Number of Volumetric Species
displays the number of gas-phase species in the selected **Mixture Material**. This is an informational display only; you cannot edit this value.

Number of Solid Species
displays the number of solid species defined in the selected **Mixture Material**. This is an informational display only; you cannot edit this value. (This list will appear only for **Species Transport** models involving **Wall Surface** reactions.)

Number of Site Species
displays the number of site species defined in the selected **Mixture Material**. This is an informational display only; you cannot edit this value. (This list will appear only for **Species Transport** models involving **Wall Surface** reactions.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulence-Chemistry Interaction

indicates which model is to be used for turbulence-chemistry interaction when the **Species Transport** model with **Volumetric** reactions is used.

Laminar Finite-Rate

computes only the Arrhenius rate (see Equation 7–8 in the Theory Guide) and neglects turbulence-chemistry interaction.

Finite-Rate/Eddy-Dissipation

(for turbulent flows) computes both the Arrhenius rate and the mixing rate and uses the smaller of the two.

Eddy-Dissipation

(for turbulent flows) computes only the mixing rate (see Equation 7–24 and Equation 7–25 in the Theory Guide).

Eddy-Dissipation Concept

(for turbulent flows) models turbulence-chemistry interaction with detailed chemical mechanisms (see Equation 7–24 and Equation 7–25 in the Theory Guide).

Coal Calculator...

opens the *Coal Calculator Dialog Box* (p. 1693).

Options

contains parameters related to the Laminar Finite-Rate or the Eddy-Dissipation Concept model. This section of the dialog box will appear when **Laminar Finite-Rate** or the **Eddy-Dissipation Concept** is selected for **Turbulence-Chemistry Interaction**.

Flow Iterations Per Chemistry Update

specifies how often ANSYS FLUENT will update the chemistry during the calculation. Increasing the number can reduce the computational expense of the chemistry calculations.

Aggressiveness Factor

is a numerical factor which controls the robustness and the convergence speed. This value ranges between 0 and 1, where 0 (the default) is the most robust, but results in the slowest convergence.

Volume Fraction Constant

specifies the value of C_ξ in Equation 7–27 in the Theory Guide.

Time Scale Constant

specifies the value of C_τ in Equation 7–28 in the Theory Guide.

Number of Grid Points in Flame

by default are 8 grid points.

PDF Options

contains options related for the non-premixed combustion model. (This section will appear only if **Non-Premixed Combustion** or **Partially-Premixed Combustion** is the selected **Model**.)

Inlet Diffusion

includes the diffusion flux of species at inlet.

Compressibility Effects

can be enabled to account for cases where substantial pressure changes occur in time and/or space when modeling a non-adiabatic system. See *Specifying the Operating Pressure for the System* (p. 845) for details.

Liquid Micro-Mixing

is used to model liquid reactions. When the **Liquid Micro-Mixing** model is invoked, ANSYS FLUENT uses the **volume-weighted-mixing-law** formula to calculate the density.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Chemistry

tab contains the parameters to define problems using the chemistry model. See *Setting Up the Equilibrium Chemistry Model* (p. 843) for details.

State Relation

Equilibrium

enables the equilibrium chemistry model. See *Setting Up the Equilibrium Chemistry Model* (p. 843) for details.

Steady Flamelet

enables the steady laminar flamelet model. See The Laminar Flamelet Models Theory in the Theory Guide for details.

Unsteady Flamelet

enables the Eulerian unsteady laminar flamelet model.

Diesel Unsteady Flamelet

enables the diesel unsteady laminar flamelet model. See *Using the Diesel Unsteady Laminar Flamelet Model* (p. 850) for details.

Energy Treatment

Adiabatic

enables adiabatic modeling options for the problem.

Non-Adiabatic

enables nonadiabatic modeling options for the problem. See Non-Adiabatic Extensions of the Non-Premixed Model in the Theory Guide for details.

Coal Calculator

opens the *Coal Calculator Dialog Box* (p. 1693).

Stream Options

contains the parameters for the equilibrium chemistry model or the steady laminar flamelet model.

Secondary Stream

includes the secondary inlet stream in the model.

Empirical Fuel Stream

enables parameters to define fuel stream empirically. This option is available only with the full equilibrium chemistry model.

Empirical Secondary Stream

enables parameters to define secondary stream empirically. This option is available only with the full equilibrium chemistry model.

Model Settings

contains a list of parameter settings.

Operating Pressure

specifies the system operating pressure used to calculate the density using the ideal gas law. See *Specifying the Operating Pressure for the System* (p. 845) for details.

Fuel Stream Rich Flamability Limit

specifies the rich flammability limit for fuel stream when the equilibrium chemistry option is used. You will not set these if you have used the empirical definition option for fuel composition. See *Enabling the Rich Flammability Limit (RFL) Option* (p. 847) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Secondary Stream Flamability Limit
specifies the rich flammability limit for secondary stream when the equilibrium chemistry option is used. You will not set these if you have used the empirical definition option for fuel composition. See *Enabling the Rich Flammability Limit (RFL) Option* (p. 847) for details.

Empirical Fuel Lower Calorific Value
specifies the lower calorific value of fuel stream.

Empirical Fuel Specific Heat
specifies the specific heat value of fuel stream.

Empirical Fuel Molecular Weight
specifies the molecular weight of the fuel stream.

Empirical Secondary Lower Calorific Value
specifies the lower calorific value of secondary stream.

Empirical Secondary Specific Heat
specifies the specific heat value of secondary stream.

Empirical Secondary Molecular Weight
specifies the molecular weight of the secondary stream.

Options
contains options related to the steady flamelet model.

Create Flamelet
enables the **Import CHEMKIN Mechanism...** button that opens the *CHEMKIN Mechanism Import Dialog Box* (p. 2055) where you can import the **CHEMKIN** mechanism and thermodynamic data, to create a flamelet file. This option is available for the steady flamelet model. See *Setting Up the Steady and Unsteady Laminar Flamelet Models* (p. 847) for details.

Import Flamelet
enables the **Import Flamelet File...** button that opens the *The **Select File** Dialog Box* (p. 33) where you can select the existing flamelet in ANSYS FLUENT. You can also set the file type parameters to import the existing flamelet in ANSYS FLUENT. See *Setting Up the Steady and Unsteady Laminar Flamelet Models* (p. 847) for details. This option is available for the steady flamelet model.

File Type
contains the toggle buttons for two flamelet file types.

Standard
enables the import of an ASCII format standard flamelet file.

Oppdif
enables the import of a binary format OPPDIF flamelet file.

CFX-RIF
enables the import of an ASCII format CFX-RIF flamelet file.

Mixture Fraction Method
contains the three methods of computing the mixture fraction profile along the laminar flamelet.

Drake
calculates the mixture fraction using carbon and hydrogen elements.

Bilger
calculates the mixture fraction using hydrocarbon formula.

Nitrogen
calculates the mixture fraction in terms of nitrogen species.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Oppdif Flamelet Type
gives you have a choice of importing **Single** or **Multiple** OPPDIF files.

Flamelet Property File Name
opens the *The **Select File** Dialog Box* (p. 33) in which you can save the existing flamelet in ANSYS FLUENT to use when running an existing case.

Thermodynamic Database File Name
specifies a path for the thermodynamic database file to be read.

Boundary
tab contains the list of boundary species and related parameters. This is available only for equilibrium chemistry model. See *Defining the Stream Compositions* (p. 851) for details.

Species
contains the list of the species used in the problem.

Fuel
specifies the fuel species.

Oxid
specifies the oxidizing species.

Second
specifies the secondary species.

Boundary Species
allows to specify the species you want to add or remove from the model. You can type the species chemical formula in the text box below it.

Add
adds the species in the model.

Remove
removes the species from the model.

List Available Species
prints a list of all species in the thermodynamic database file (`thermo.db`) in the console window.

Temperature
specifies the temperature of different streams that you have defined.

Fuel
is the temperature of the fuel inlet in the model.

Oxid
is the temperature of the oxidizer inlet in the model.

Second
is the temperature of the secondary stream inlet in the model.

Specify Species in
allows to define the unit of species concentration.

Mass Fraction
allows to specify the species in terms of mass fraction.

Mole Fraction
allows to specify the species in terms of mole fraction.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Control

tab contains the parameters for exclusion and inclusion of equilibrium species. This is available only for equilibrium chemistry model. See *Forcing the Exclusion and Inclusion of Equilibrium Species* (p. 862) for details.

Species Excluded from Equilibrium

lists the species excluded from equilibrium calculation.

Species

lists the slow-forming species that are zeroed in the initial flamelet profile.

Add

allows to add equilibrium species.

Remove

allows to remove equilibrium species.

List Available Species

prints a list of all species in the thermodynamic database file in the console window.

Flamelet Controls

allows you to adjust the controls for the flamelet solution. Note that the **Create Flamelet** option in the **Chemistry** tab must be selected for the **Steady Flamelet** model for these controls to be available.

Initial Fourier Number

sets the first time step for the solution.

Fourier Number Multiplier

increases the time step at subsequent times. Every time step after the first is multiplied by this value.

Relative Error Tolerance and Absolute Error Tolerance

specifies the local error controls during numerical integration.

Flamelet Convergence Tolerance

specifies the maximum absolute change in species fraction or temperature at any discrete mixture-fraction.

Maximum Integration Time

specifies the maximum total elapsed time for flamelet calculation. ANSYS FLUENT will stop the flamelet calculation after the total elapsed time has exceeded this value.

Flamelet

tab allows you to adjust the controls for the flamelet solution. See *Defining the Flamelet Controls* (p. 863) for details.

Flamelet Parameters

consist of the controls for the flamelet solution.

Number of Grid Points in Flamelet

specifies the number of mixture fraction grid points distributed between the oxidizer ($f = 0$) and the fuel ($f = 1$).

Maximum Number of Flamelets

specifies the maximum number of laminar flamelet profiles to be calculated.

Initial Scalar Dissipation

is the scalar dissipation of the first flamelet in the library.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Scalar Dissipation Step

specifies the interval between scalar dissipation values (in s^{-1}) for which multiple flamelets will be calculated.

Unsteady Flamelet Parameters

consist of the controls for the unsteady flamelet solution.

Number of Grid Points in Flamelet

specifies the number of mixture fraction grid points distributed between the oxidizer ($f = 0$) and the fuel ($f = 1$).

Mixture Fraction Lower Limit for Initial Probability

is the limit at which the unsteady flamelet model temporally convects and diffuses a marker probability equation through a steady-state ANSYS FLUENT flow-field.

Maximum Scalar Dissipation

is where flamelets extinguish at large scalar dissipation (mixing) rates.

Courant Number

is the number at which ANSYS FLUENT automatically selects the time step for the probability equation based on this convective Courant number.

Calculate Flamelets

begins the laminar flamelet calculation.

Display Flamelets...

opens the *Flamelet 3D Surfaces Dialog Box* (p. 1697) from which you can display 2D plots and 3D surfaces showing the variation of species fraction or temperature with the mean mixture fraction or scalar dissipation.

Initialize Unsteady Flamelet Probability

initializes the unsteady flamelet and its probability marker equation.

Display Unsteady Flamelet...

opens the *Flamelet 2D Curves Dialog Box* (p. 1699) from which you can display 2D plots of the different variables.

Table

tab contains parameters to create the look-up table. See *Calculating the Look-Up Tables* (p. 871) for details of the items listed below.

Table Parameters

consist of the controls for the lookup table.

Number of Mean Mixture Fraction Points

is the number of discrete values of $\overline{f}$ at which the look-up tables will be computed.

Number of Secondary Mixture Fraction Points

is the number of discrete values of p_{sec} at which the look-up tables will be computed. This option is available only when a secondary stream has been defined.

Number of Mixture Fraction Variance Points

is the number of discrete values of $\overline{f'^2}$ at which the look-up tables will be computed. This option is available only when no secondary stream has been defined.

Maximum Number of Species

is the maximum number of species that will be included in the look-up tables.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of Mean Enthalpy Points
is the number of discrete values of enthalpy at which the three-dimensional look-up tables will be computed. This input is required only if you are modeling a non-adiabatic system.

Minimum Temperature
is used to determine the lowest temperature for which the look-up tables are generated (see Figure 8.10: "Visual Representation of a Look-Up Table for the Scalar as a Function of Mean Mixture Fraction and Mixture Fraction Variance and Normalized Heat Loss/Gain in Non-Adiabatic Single-Mixture-Fraction Systems" in the Theory Guide). This option is available only if you are modeling a non-adiabatic system.

Include Equilibrium Flamelet
specifies that an equilibrium flamelet (i.e., $\chi = 0$) will be generated in ANSYS FLUENT and appended to the flamelet library before the PDF table is calculated. This option is available only when you are generating more than one laminar flamelet.

Calculate PDF Table
generates the look-up table.

Display PDF Table
opens the *PDF Table Dialog Box* (p. 2145) where you can display 2D plots and 3D surfaces showing the variation of species mole fraction, density, or temperature with the mean mixture fraction, mixture fraction variance, or enthalpy.

Premixed
tab contains parameters needed to modify the piecewise-linear points. See *Modifying the Unburnt Mixture Property Polynomials* (p. 907) for the details.

Partially Premixed Mixture Properties
contains the list of properties that you can modify. **Edit...** opens the **Quadratic Mixture Fraction** dialog box where you can modify the values of the polynomial coefficients.

For each polynomial function of $\overline{f}$ under **Partially Premixed Mixture Properties** you can click **Edit...** and specify values for **Coefficient 1**, **Coefficient 2**, **Coefficient 3**, and **Coefficient 4** in the appropriate **Quadratic of Mixture Fraction** dialog box.

Premixed Combustion Model Options
contains options for the premixed combustion model. (This section will appear only if **Premixed Combustion** is the selected **Model**.)

Adiabatic
enables the adiabatic premixed combustion model, which calculates temperature using Equation 9–64 in the Theory Guide.

Non-Adiabatic
enables the non-adiabatic premixed combustion model, which calculates temperature using Equation 9–65 in the Theory Guide.

Premixed Model
contains options for choosing a premixed model.

C Equation
allows you to choose the C equation as described in C-Equation Model Theory.

Extended Coherent Flamelet Model
allows you to choose the Extended Coherent Flamelet model as described in Extended Coherent Flamelet Model Theory.

G Equation
allows you to choose the G equation as described in G-Equation Model Theory.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulent Flame Speed Model

contains the **Flame Speed Model** drop-down list, which allows you to choose between the **zimont** or the **peters** model constants for the Zimont premixed combustion model. (This section will appear only if **Premixed Combustion** or **Partially Premixed Combustion** is the selected **Model** and if the **C Equation** or **G Equation** premixed model is chosen.)

Turbulent Length Scale Constant

specifies the value of C_D in Equation 9–11 in the Theory Guide.

Turbulent Flame Speed Constant

specifies the value of A in Equation 9–9 in the Theory Guide.

Stretch Factor Coefficient

specifies the value of μ_{str} in Equation 9–16 in the Theory Guide.

Turbulent Schmidt Number

specifies the value of Sc_t in Equation 9–1 in the Theory Guide.

Wall Damping Coefficient

specifies the value of α_w in Equation 9–19.

Ewald Corrector

is enabled by default and described in Peters Flame Speed Model.

G Equation Settings

allows you to select either the **transport equation** or **algebraic** option for the calculation of the flame distance variance. Consult Peters Flame Speed Model in the Theory guide for the variance transport and algebraic equation expressions (Equation 9–6 and Equation 9–7).

Flame Curvature Source

includes the curvature source term in the G-Equation, which is the last term in Equation 9–4.

Extended Coherent Flamelet Model Constants

contains model constants for the Extended Coherent Flame Model. (This section will appear only if **Premixed Combustion** or **Partially Premixed Combustion** is the selected **Model** and if the **Extended Coherent Flame Model** flame speed model is chosen.) See *Modifying the Constants for the ECFM Flame Speed Closure* (p. 900) for details.

ITNFS Treatment

contains a drop-down list of the available ITNFS treatments: **constant-delta**, **meneveau**, **blint**, **poinsot**, and **constant**.

ITNFS Flame Thickness

sets the flame thickness (Equation 9–28 in the Theory Guide).

Turbulent Schmidt Number

set the turbulent Schmidt number (Sc_t).

Wall Flux Coefficient

set the wall flux coefficient.

PDF Transport Options

contains options for the Composition PDF Transport combustion model. (This section will appear only if **Composition PDF Transport** is the selected **Model**.)

Lagrangian

solves the composition PDF transport equation by stochastically tracking Lagrangian particles through the domain.

Eulerian

assumes a shape for the PDF, allowing Eulerian transport equations to be derived.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mixing

tab contains the mixing models.

Mixing Model

contains options to specify the method for modeling molecular diffusion. (This section will appear only if **Composition PDF Transport** is the selected **Model**.) See Particle Mixing in the Theory Guide for details.

Modified Curl

enables the modified curl model for molecular diffusion.

IEM

enables the IEM model for molecular diffusion.

EMST

enables the EMST mixing model for molecular diffusion.

Mixing Constant

specifies the value of the mixing constant C_ϕ in Equation 11–6 and Equation 11–8 in the Theory Guide.

Boundary

tab allows you to define the fuel and oxidizer compositions. This is only available if you select **Eulerian** as the **PDF Transport Option**.

Species

consists of the fuel species and the oxidizer.

Fuel

is the mole or mass fraction of the fuel stream. The sum of mass or mole fractions of all species in the fuel stream should be 1.

Oxidizer

is the mole or mass fraction of the oxidizer stream. The sum of mass or mole fractions of all species in the fuel oxidizer stream should be 1.

Specify Species in

specifies the species as a **Mass Fraction** or **Mole Fraction**.

Control

tab contains Lagrangian PDF transport parameters.

PDF Transport Parameters

allows you to set the **Particles Per Cell**.

Particles Per Cell

sets the number of PDF particles per cell. Higher values of this parameter will reduce statistical error, but increase computational time.

Local Time Stepping

toggles the calculation of local time steps. If this option is disabled, then you will need to specify the **Time Step** directly (see Equation 11–4 in the Theory Guide). This option is available for steady-state simulations.

Convection #

specifies the particle convection number (see Δt_{conv} in Equation 11–4 in the Theory Guide).

Diffusion #

specifies the particle diffusion number (see Δt_{diff} in Equation 11–4 in the Theory Guide).

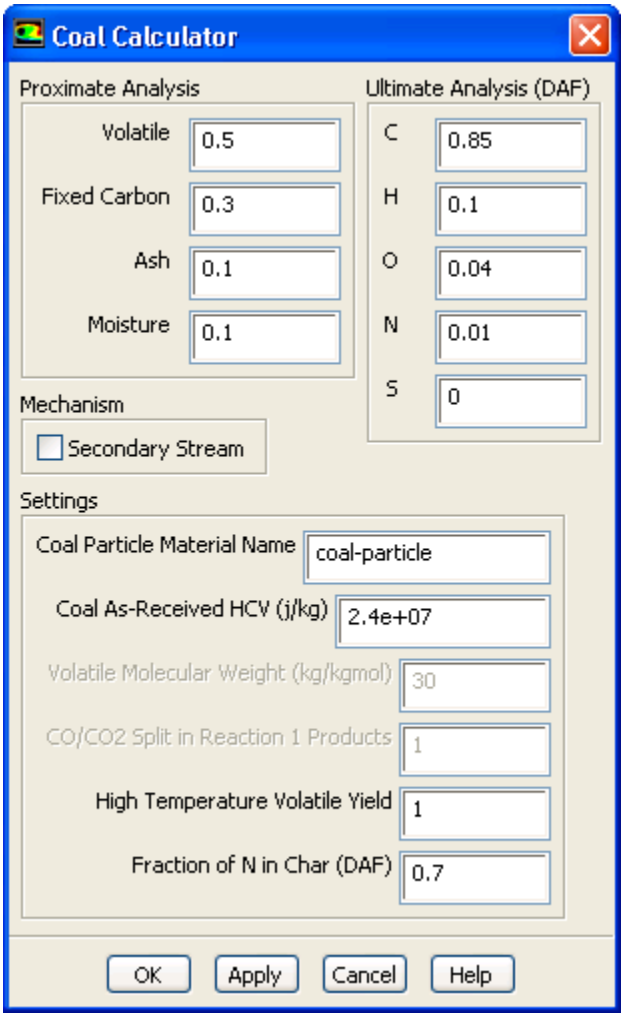
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mixing #

specifies the particle mixing number (see Δt_{mix} in Equation 11–4 in the Theory Guide).

35.3.19. Coal Calculator Dialog Box

The **Coal Calculator** dialog box automates the calculations described in *Additional Coal Modeling Inputs in ANSYS FLUENT* (p. 858).



Proximate Analysis

is the mass fraction of **Volatile**, **Fixed Carbon**, **Ash**, and **Moisture** in the coal.

Volatile

is the fraction of the volatile component.

Fixed Carbon

is calculated as one minus the sum of the actual **Volatile**, **Ash**, and **Moisture** fractions.

Ash

is the fraction of ash.

Moisture

is the moisture fraction in the coal.

Ultimate Analysis (DAF)

is the mass fraction of atomic **C, H, O, N** and optionally **S**, in the Dry-Ash-Free (DAF) coal.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mechanism

allows you to set the mechanisms.

Secondary Stream

when enabled, allows you to set the two mixture fraction model with the primary stream representing char as $C<\mathrm{s}>$, and an empirical secondary stream representing the volatiles. This is available when using the non-premixed combustion model.

One-step Reaction

is defined in *Equation 16–6* (p. 821).

Two-step Reaction

involves oxidation of volatiles to CO in the first reaction and oxidation of CO to CO_2 in the second reaction, as described in *Equation 16–7* (p. 821).

Include SO2

when enabled, allows you to input the atomic mass fraction of sulphur, **S**, which appears under **Ultimate Analysis**.

Options

Wet Combustion

when enabled will activate the DPM **Wet Combustion** option by default in all injections created after the **OK** button is clicked in the **Coal Calculator** dialog box.

Settings

is where you will specify the values used in the calculation.

Coal Particle Material Name

is the name of the DPM combusting particle material. The default name is *coal-particle*.

Coal As-Received HCV

is the higher caloric value of the coal.

Volatile Molecular Weight

is the molecular weight of pure volatiles.

CO/CO2 Split in Reaction 1 Products

can be used to specify the molar fraction of CO to CO_2 in the first reaction of *Equation 16–7* (p. 821). The default value of 1 implies that all carbon is reacted to CO, with no CO_2 produced.

High Temperature Volatile Yield

is where the enhanced devolatization at higher temperatures can cause the volatile yield to exceed the proximate analysis fraction.

Fraction of N in Char (DAF)

is used in calculating the split of atomic nitrogen for the Fuel NOx model.

Coal Dry Density

is used to calculate the **Volume Fraction** of liquid-water for the **Wet Combustion** option in the **Injections** dialog box.

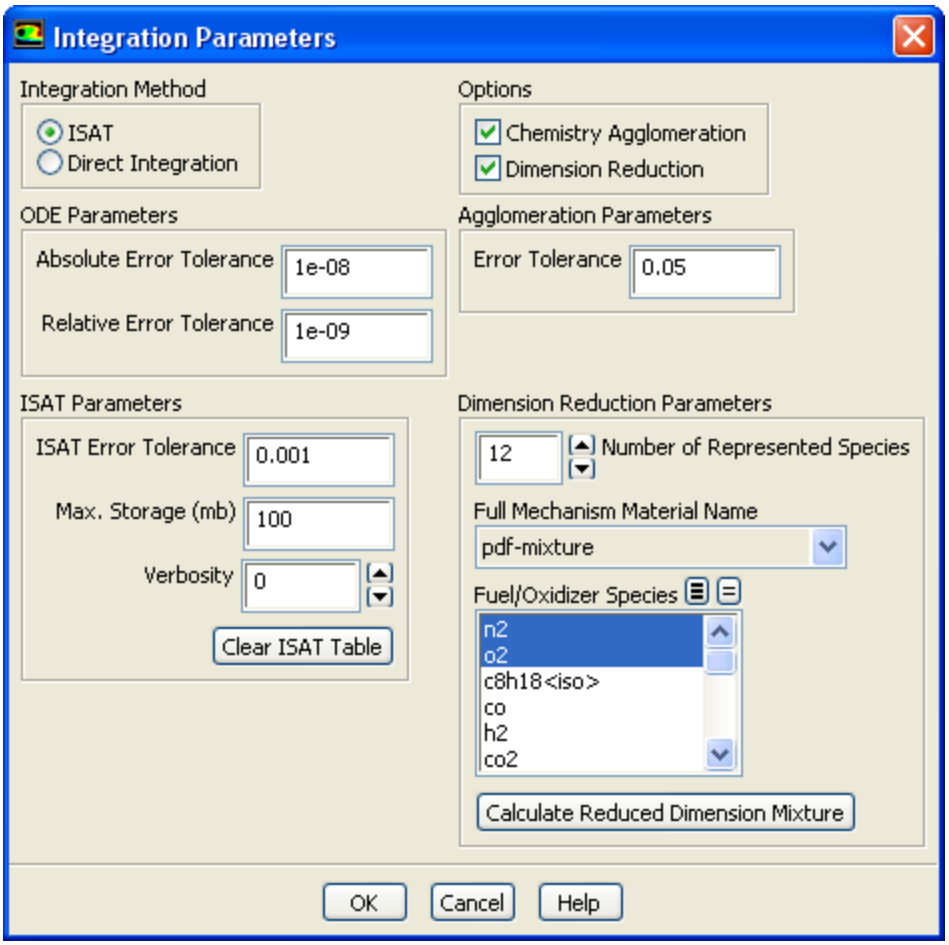
Gas Phase Reaction

lists the reaction based on your entries for the proximate and ultimate analyses.

35.3.20. Integration Parameters Dialog Box

The **Integration Parameters** dialog box allows you to set the parameters for the integration of the chemical source term S in Equation 11–10 in the Theory Guide. See *Using ISAT* (p. 924) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Integration Method

contains options to choose the method for integration.

ISAT

enables the ISAT option and expands the dialog box to include inputs for ISAT parameters.

Direct Integration

enables the direct integration method to integrate the chemical source term in the calculation.

ODE Parameters

contains options to specify the error tolerances.

Absolute Error Tolerance

specifies the absolute error tolerance.

Relative Error Tolerance

specifies the relative error tolerance.

ISAT parameters

contains inputs required for ISAT integration method.

ISAT Error Tolerance

controls the numerical error in ISAT liner interpolation. Decrease this value to get accurate minor species and pollutant predictions.

Max. Storage

is the maximum RAM used by the ISAT table, and has a default value is 100 MB.

Verbosity

specifies the level of detail at which you can monitor the ISAT performance.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Clear ISAT Table
purges the ISAT table.

Options
contains options to choose the method for chemistry acceleration.

Chemistry Agglomeration
when enabled, provides additional run-time improvement, with a corresponding decrease in accuracy.

Dimension Reduction
is a chemistry acceleration method in addition to ISAT storage-retrieval and Cell Agglomeration, providing faster chemistry calculations with a corresponding loss of accuracy.

Agglomeration Parameters
allows you to specify the **Error Tolerance**. This determines the size of the clusters and by default the value is 0.05

Dimension Reduction Parameters
contains settings to accelerate the chemistry.

Number of Represented Species
must be greater than 10 and less than the number of species in the full mechanism. The **Number of Represented Species** must also be less than 50 minus the number of unrepresented elements (the number of chemical elements in the unrepresented species).

Full Mechanism Material Name
is typically the name of the CHEMKIN mechanism that you imported.

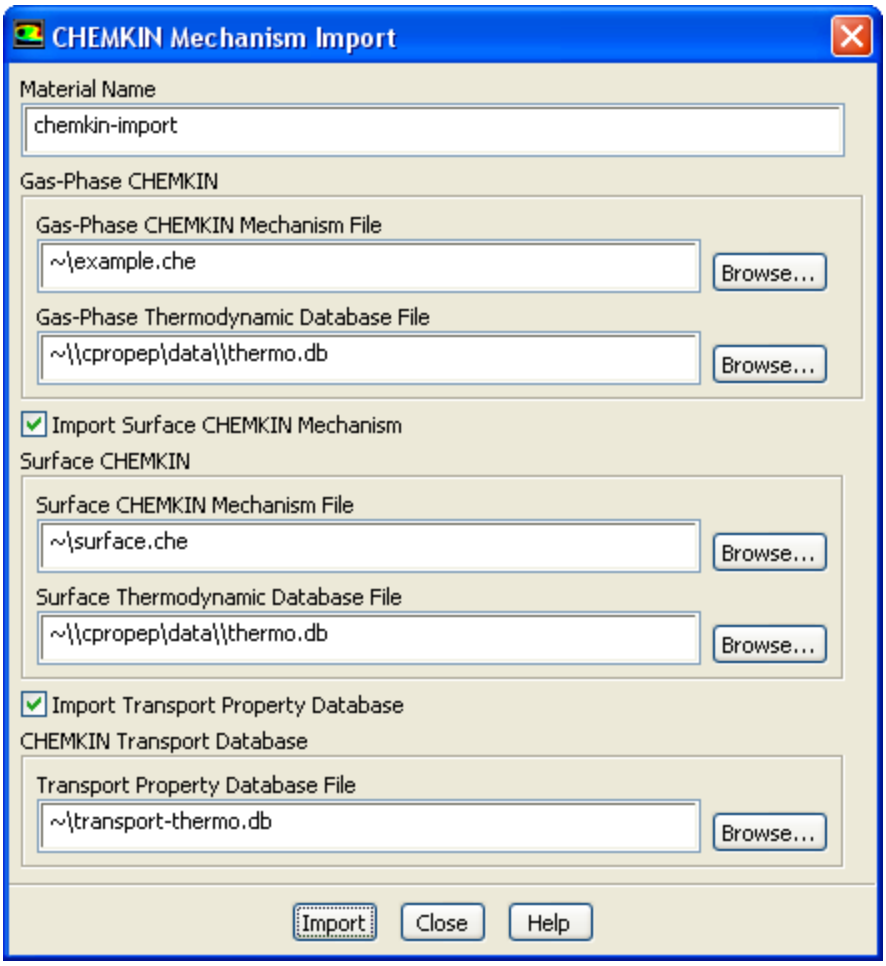
Fuel/Oxidizer Species
is where the boundary and initial fuel and oxidizer, as well as product species, are set as represented species.

Create Reduced Dimension Mixture
creates a new mixture material called `reduced-dimension-mixture`, which contains the represented species as well as proxy 'species' for the unrepresented elements.

35.3.21. Chemkin Mechanism Import Dialog Box

The **Chemkin Mechanism Import** dialog box allows you to read the chemical kinetic mechanism and thermodynamic data. See *Setting Up the Steady and Unsteady Laminar Flamelet Models* (p. 847) for details on the items listed below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Gas-Phase CHEMKIN

contains parameters to import the gas phase chemkin mechanism.

Gas-Phase CHEMKIN Mechanism File

specifies the path of the Chemkin file to be read.

Gas-Phase Thermodynamic Database File

specifies the location of the thermodynamic database.

Import Surface Chemkin Mechanism

enables parameters to import the surface chemkin mechanism.

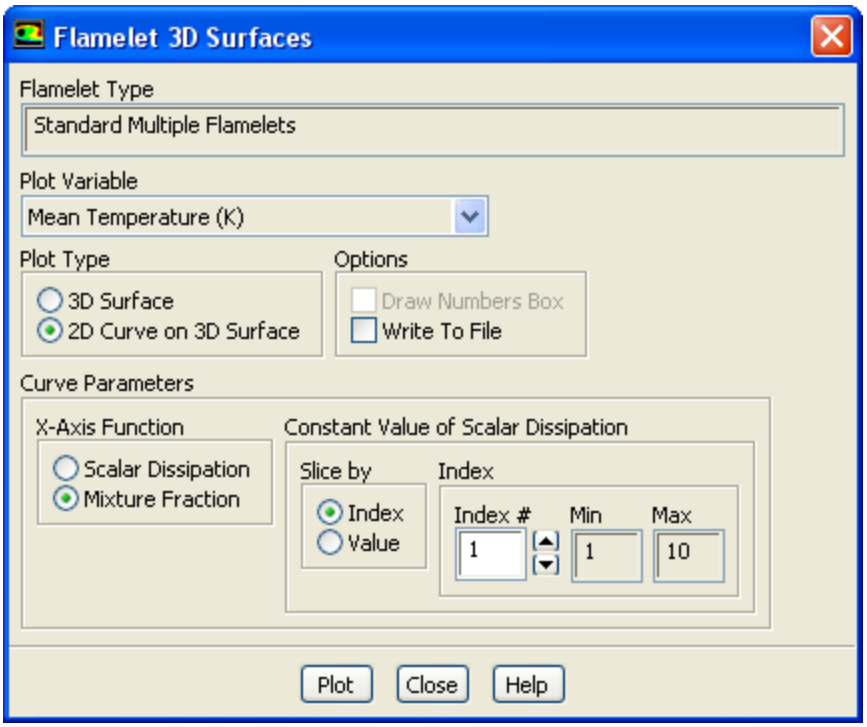
Import Transport Property Databases

(optional) allows to import transport properties.

35.3.22. Flamelet 3D Surfaces Dialog Box

The **Flamelet 3D Surfaces** dialog box allows you to display 2D plots and 3D surfaces showing the variation of species fraction or temperature with the mean mixture fraction or scalar dissipation. See *Postprocessing the Flamelet Data* (p. 868) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Flamelet Type
indicates the type of flamelets whose surfaces will be displayed.

Plot Variable
enables you to choose temperature or species fraction as the variable to be plotted.

Plot Type
consists of options for plot type.

3D Surface
enables plotting on 3D surfaces.

2D curve on 3D surface
enables plotting of a 2D curve on a 3D surface.

Options
consists of the following parameters:

Draw Numbers Box
enables the display of a wireframe box with the numerical limits in each coordinate direction.

Write To File
enables saving the plot data to a file.

Curve Parameters
consists of controls related to plot display.

X-Axis Function
consists of the function against which the plot variable will be displayed.

Scalar Dissipation
enables display of plot variable against the scalar dissipation function.

Mixture Fraction
enables display of plot variable against the mixture fraction.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Constant Value of Scalar Dissipation

consists of the controls to specify the type of discretization (i.e., how the flamelet data will be sliced) for the variable that is being held constant.

Slice by

consists of the controls to specify discretization.

Index

enables you to specify discretization index of the variable that is being held constant.

Value

enables you to specify the numerical value of the variable that is being held constant.

Index

consists of the controls that are displayed when you enable **Index** under **Slice by**.

Index #

displays the index number.

Min

displays the minimum of the range of integer values that you are allowed to choose from.

Max

displays the maximum of the range of integer values that you are allowed to choose from.

Value

consists of the controls that are displayed when you enable **Value** under **Slice by**.

Value

enables you to enter the numerical value of the variable that is being held constant.

Min

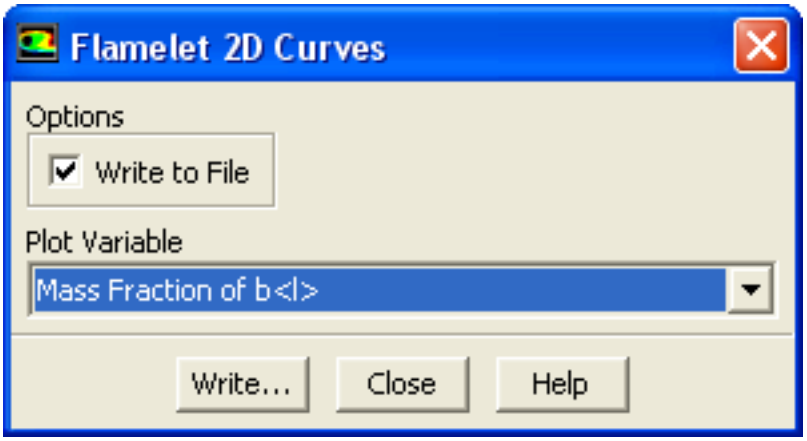
displays the minimum of the range of integer values that you are allowed to choose from.

Max

displays the minimum of the range of integer values that you are allowed to choose from.

35.3.23. Flamelet 2D Curves Dialog Box

The **Flamelet 2D Curves** dialog box allows you to display or write 2D curves of the unsteady flamelet. See *Postprocessing the Flamelet Data* (p. 868) for details.



Options

gives you the option to plot or **Write to File** 2D curves.

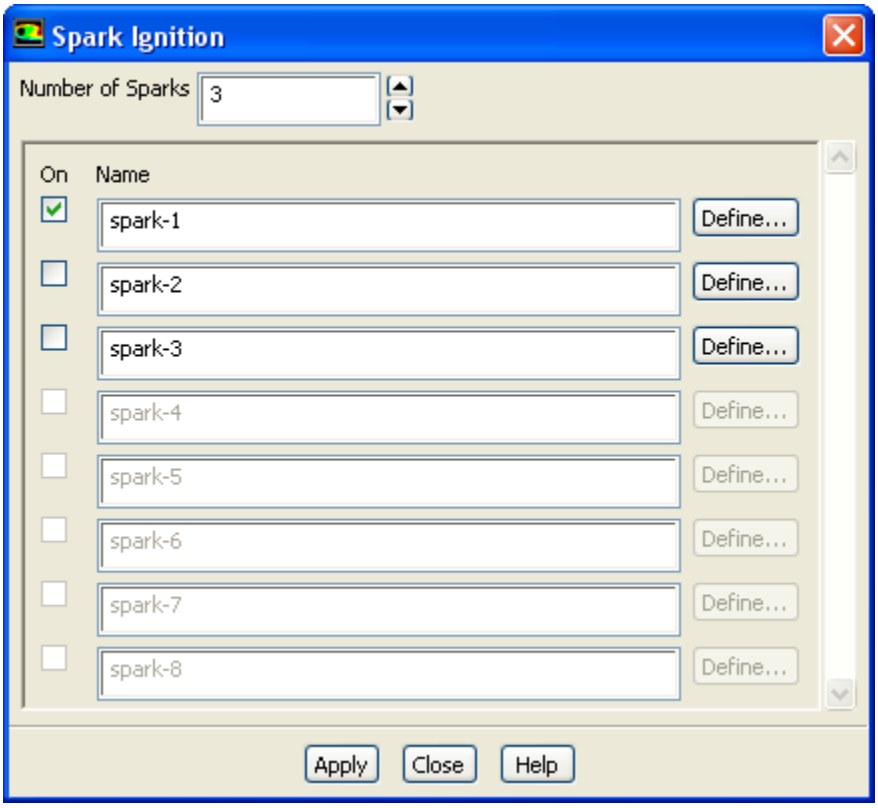
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Plot Variable
consists of a drop-down list of variables that you can plot or write.

Plot
is available by default. When the **Write to File** option is enabled the **Plot** button changes to a **Write...**.

35.3.24. Spark Ignition Dialog Box

The **Spark Ignition** dialog box allows you to define multiple sparks (see *Spark Model* (p. 929) for details).



Controls

Number of Sparks
is the quantity of sparks you would like to include in your simulation. You can define up to 16 sparks.

On
if enabled, activates those sparks that will be included in the simulation.

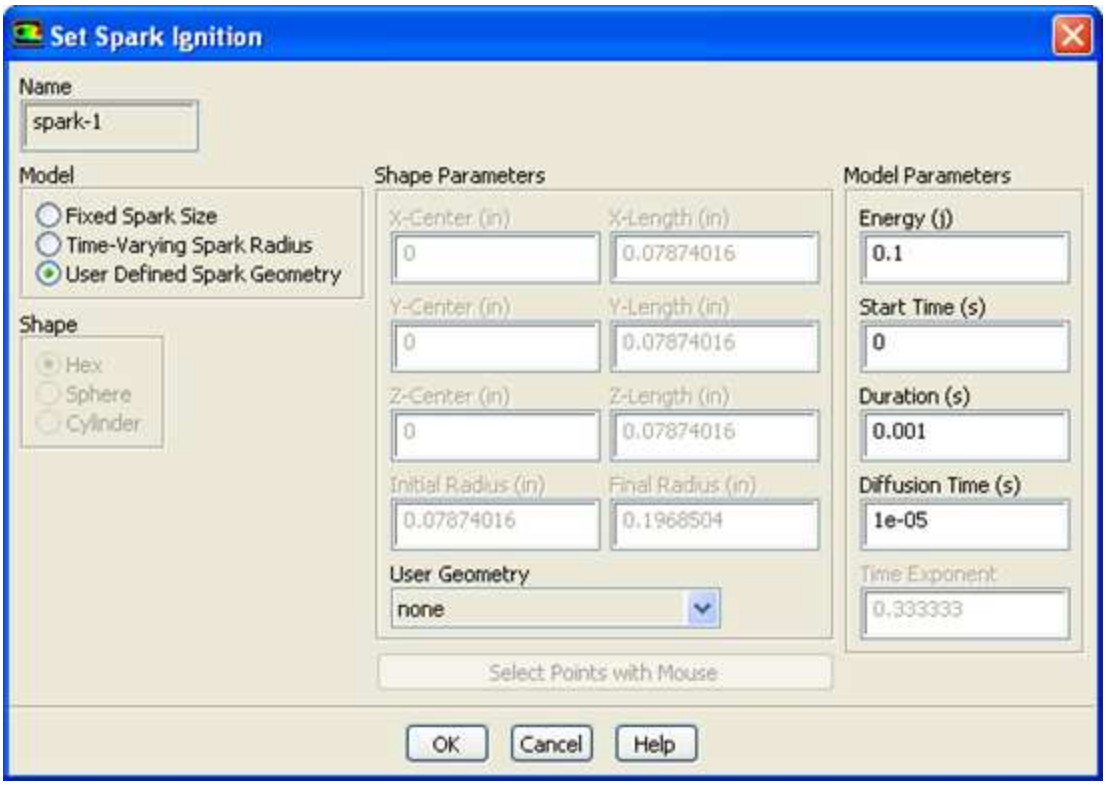
Name
is the name of the spark. You can specify a name, or use the default name.

Define...
opens the *Set Spark Ignition Dialog Box* (p. 1700).

35.3.25. Set Spark Ignition Dialog Box

The **Set Spark Ignition** dialog box allows you to set the parameters related to the spark ignition model (see *Spark Model* (p. 929) for details).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name
displays the name of the spark being defined.

Model
contains the available spark ignition models.

Fixed Spark Size
enables the spark ignition calculations using the fixed spark size model.

Time-Varying Spark Radius
enables the spark ignition calculations using the time varying spark radius.

User Defined Spark Geometry
allows you to hook a user-defined function to define custom spark kernel volume shapes.

Shape
contains the different shapes of the spark. This option is available only for **Fixed Spark Size** model

Hex
enables hex shape spark.

Sphere
enables spherical shape spark.

Cylinder
enables cylindrical shape spark.

ECFM Spark Model
contains model variants used to define the value of the flame surface density. These models appear only when the **Extended Coherent Flamelet Model** (*Setting Up the Extended Coherent Flame Model* (p. 899)) is selected in the **Species Model** dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Boudier
is available only as a time dependent kernel geometry. The geometric growth rate is the same as that used for the basic spark model with other combustion models. See Boudier Model.

Teraji
is available only as a time dependent kernel geometry. See Teraji Model.

Zimont
operates in the same way as the spark model used with the Zimont combustion model. The geometry of the spark may be time dependent or fixed. See Zimont Model.

Constant Value
allows you to specify the **Flame Surface Density**. See for details.Constant Value Model

User Defined Sigma Source
allows you to apply a custom source term to the ECFM equation within the volume of the spark ignition kernel.

Shape Parameters
contains the parameters needed to define the shape and size of the spark.

X, Y, and Z-Center
specifies the points in x, y, and z direction.

X, Y, and Z-Length
specifies the length in x, y, and z direction.

Initial Radius
specifies the initial spark radius.

Final Radius
specifies the final spark radius.

User Geometry
allows you to hook a user-defined function to define custom spark kernel volume shapes. For details about this user-defined function, please refer to DEFINE_SPARK_GEOM in the UDF Manual.

Model Parameters
contains the parameters needed to define the spark.

Energy
contains the total energy input by the spark.

Start Time
is the time of spark ignition initialization.

Duration
is the duration of the spark ignition.

Diffusion Time
is the spark diffusion time in seconds.

Time Exponent
is the time exponent specified when the **Time-Varying Spark Radius** is used.

Flame Surface Density
is defined by Equation 13–5, when the extended coherent flamelet (ECFM) combustion model is used. The value of the flame surface density must be set within the spark region and can be specified when **Constant Value** is selected under **ECFM Spark Model**.

User Sigma Source
allows you to apply a custom source term to the ECFM equation within the volume of the spark ignition kernel. For more detail about this user-defined function, please refer to Hooking

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

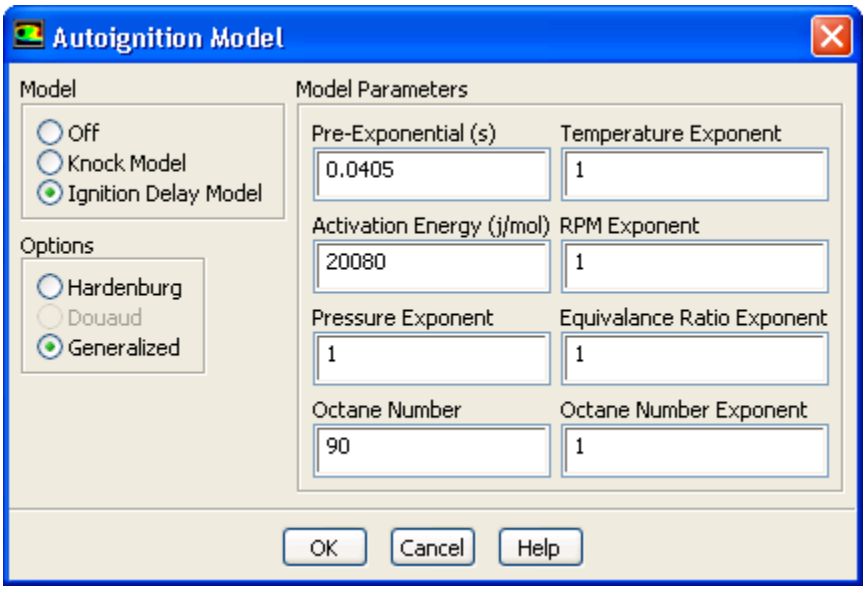
DEFINE_ECFM_SPARK_SOURCE UDFs of the UDF Manual. This selection is available when **User Defined Sigma Source** is enabled under **ECFM Spark Model**.

Select Points with Mouse

allows to select the shape parameters of the spherical spark using mouse.

35.3.26. Autoignition Model Dialog Box

The **Autoignition Model** dialog box allows you to set the parameters related to the **Knock Model** or the **Ignition Delay Model**. See *Modeling Engine Ignition* (p. 929) for details.



Controls

Model

contains options to disable or enable models.

Off

disables the model.

Knock Model

enables the knock model. With the **Premixed Combustion** or **Partially Premixed Combustion** models selected, only the **Knock Model** can be turned on.

Ignition Delay Model

enables the ignition delay model.

Options

contains two correlation options that exist with each model.

Douaud

option is used for knock in spark ignition engines. The modeling parameters that are specified in the GUI for this option are the **Pre Exponential**, **Pressure Exponent**, **Activation Temperature**, **Octane Number**, and **Octane Exponent** (Equation 13–12 in the Theory Guide).

Generalized

enables generalized correlation described by Equation 13–13 in the Theory Guide. It requires the same parameters as in the ignition delay model.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Hardenburg
enables Hardenburg correlation, which is used for heavy-duty diesel engines. This option is activated only for the ignition delay model.

Model Parameters
contains parameters related to the selected model. See *Using the Autoignition Models* (p. 933) for the details about the parameters in this dialog box.

Pre-Exponential
see Equation 13–13 and Equation 13–12 in the Theory Guide.

Activation Temperature
see Equation 13–12 in the Theory Guide.

Pressure Exponent
see Equation 13–13 and Equation 13–12 in the Theory Guide.

Octane Number
see Equation 13–13 and Equation 13–12 in the Theory Guide.

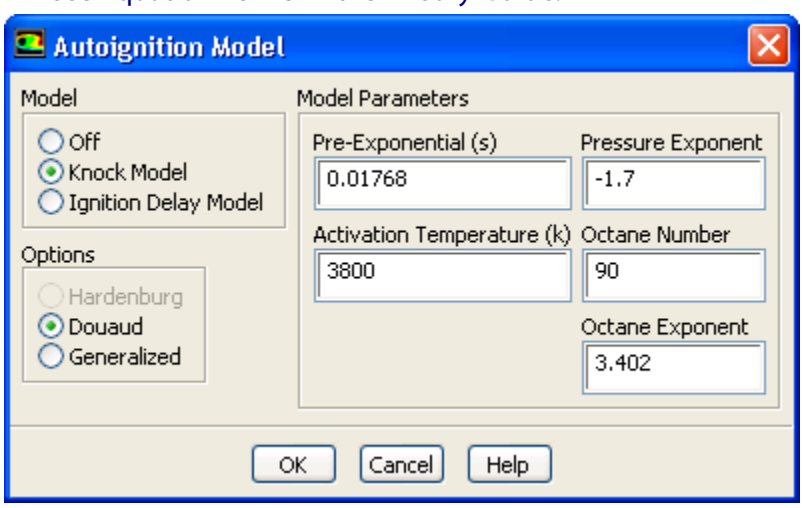
Octane Number Exponent
see Equation 13–13 and Equation 13–12 in the Theory Guide.

Activation Energy
see Equation 13–13 and Equation 13–15 in the Theory Guide.

Temperature Exponent
see Equation 13–13 in the Theory Guide.

RPM Exponent
see Equation 13–13 in the Theory Guide.

Equivalence Ratio Exponent
see Equation 13–13 in the Theory Guide.



Options
contains two correlation options that exist with this model.

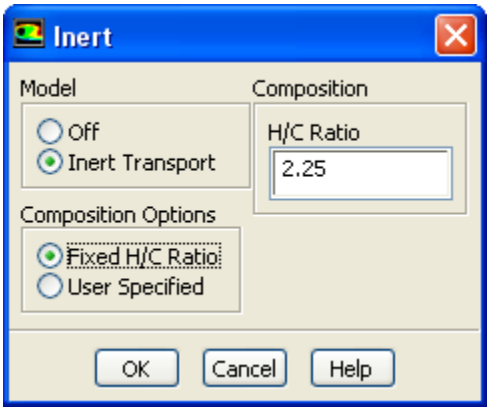
Douaud
enables Douaud correlation (Equation 13–12 in the Theory Guide) used for knock in SI engines.

Generalized
option (Equation 13–13 in the Theory Guide) in the knock model require the same parameters as in the ignition delay model.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.3.27. Inert Dialog Box

The **Inert** dialog box allows you to set the parameters related to the inert model. For details, see *Setting Up the Inert Model* (p. 880).



Controls

Model

allows you to enable or disable the inert model.

Off

disables the model.

Inert Transport

enables the inert model.

Composition Options

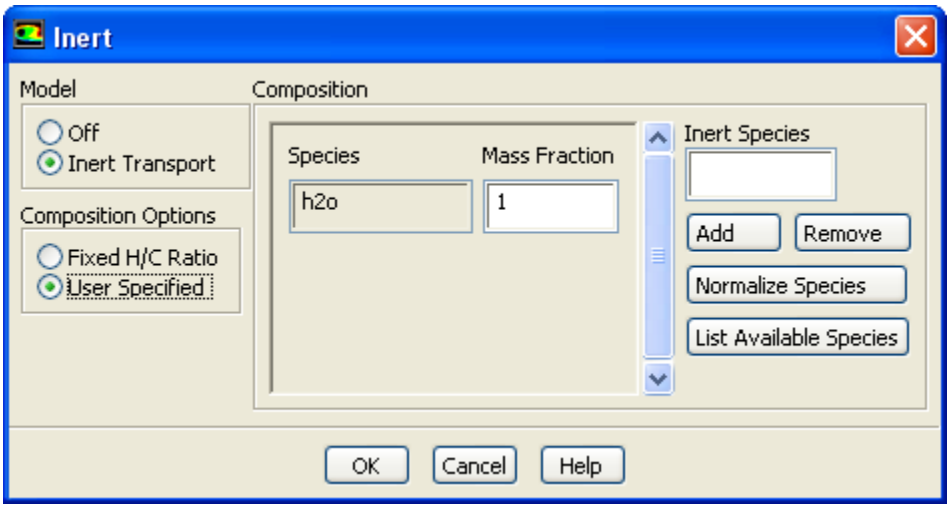
allows you to select a fixed H/C ratio or to specify the composition.

Fixed H/C Ratio

allows you to specify a fixed ratio of hydrogen to carbon in the **H/C Ratio** field.

User Specified

allows you to specify an arbitrary composition for the inert stream.



Composition

allows you to set the H/C ratio or the mass fraction.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When **Fixed H/C Ratio** is selected under **Composition Options**, the following option(s) are available:

H/C Ratio
specifies the fixed ratio of hydrogen to carbon when the **Fixed H/C Ratio** option is enabled.

When **User Specified** is selected under **Composition Options**, the following option(s) are available:

Species
lists the inert species name.

Mass Fraction
displays the mass fraction of the corresponding species.

Inert Species
allows you to specify the name of the inert species.

Add
adds the specified inert species to the species list.

Remove
removes the specified inert species from the species list.

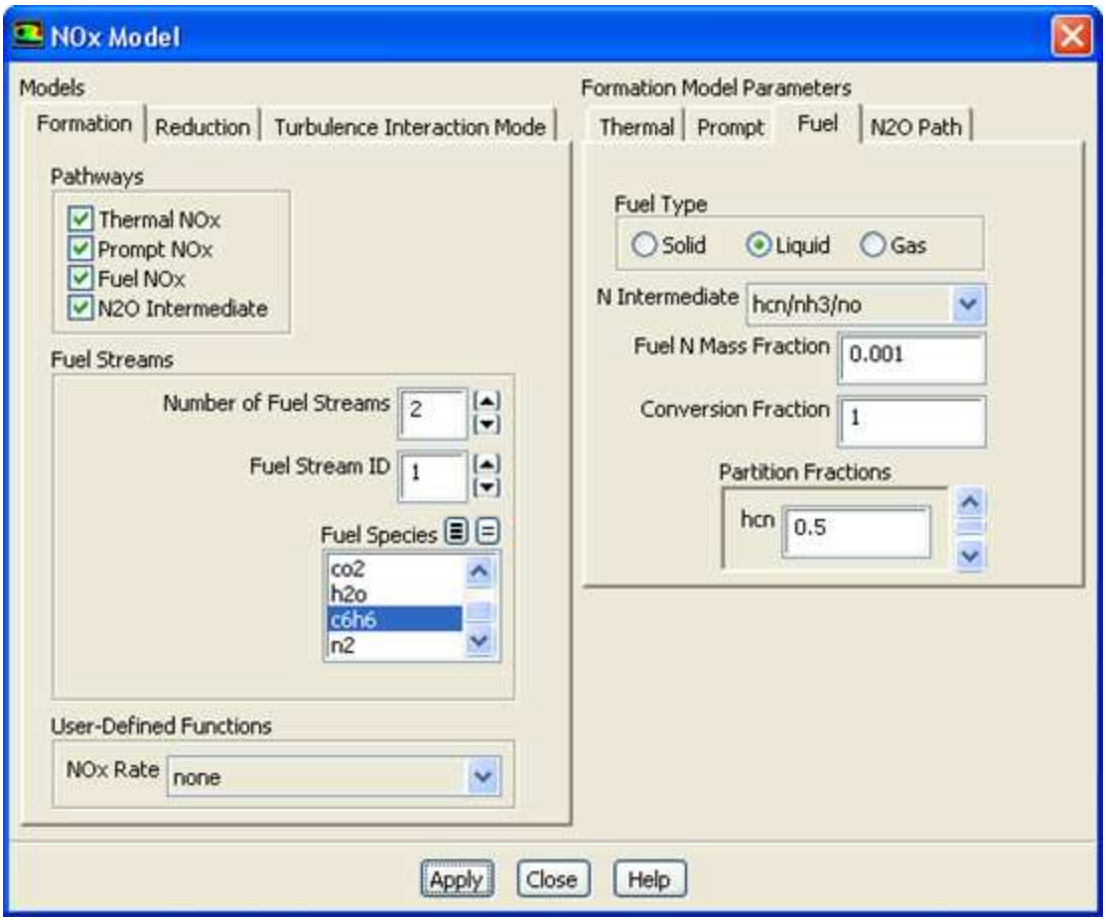
Normalize Species
makes sure the species mass fractions add up to 1.

List Available Species
lists all species in the thermodynamic database file (`thermo.db`) in the console window,

35.3.28. NOx Model Dialog Box

The **NOx Model** dialog box allows you to set parameters related to the NOx postprocessor. See *Using the NOx Model* (p. 943) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Models

contains tabs for defining the models used to calculate the NOx production.

Formation

contains the parameters to define the NOx model formation.

Pathways

contains toggle buttons for activating the NOx models to be used for the calculation of NO and HCN concentrations.

Thermal NOx

enables calculation of thermal NOx.

Prompt NOx

enables the calculation of prompt NOx.

Fuel NOx

enables the calculation of fuel NOx. When using the non-premixed combustion model, the **Fuel NOx** option is only available if the DPM model is also enabled.

N2O Intermediate

enables the formation of NOx through an N_2O intermediate. This option will only appear if one of the previously listed NOx models is enabled.

Fuel Streams

allows you to define multiple fuel streams for prompt NOx and fuel NOx formation.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of Fuel Streams
sets the number of fuel streams. You are allowed up to three fuel streams.

Fuel Stream ID
specifies the fuel stream you are defining in the **PDF Stream** drop-down list, the **Fuel Species** selection list, the **Prompt** tab, and the **Fuel** tab.

PDF Stream
specifies the PDF stream species associated with a particular **Fuel Stream ID**, when calculating fuel NOx formation in conjunction with the non-premixed combustion model. You can select either the **primary** or **secondary** fuel streams, as defined in the PDF table.

Fuel Species
is a list containing all of the defined species, which allows you to specify the species that is the fuel associated with a particular **Fuel Stream ID**. You cannot select more than 5 fuel species for each fuel stream, and the total number of fuel species selected for all the fuel streams combined cannot exceed 10. Note that when the non-premixed combustion model is enabled, your selection in the **Fuel Species** list only applies to prompt NOx calculations.

User-Defined Functions
contains the **NOx Rate** drop-down list, which allows you to use a user-defined function (UDF) to contribute to the rate of NOx production. See the separate UDF Manual for details. Note that you may also use a UDF to specify custom values for the maximum limit (T_{max}) that is used for the integration of the temperature PDF (when temperature is accounted for in the turbulence interaction modeling).

Reduction
allows you to specify the reduction methods.

Methods
contains the list of reduction methods.

Reburn
enables the calculation of NOx reburning effects.

SNCR
enables the calculation of NOx reduction by the SNCR method.

Turbulence Interaction Mode
contains parameters related to the effect of turbulent fluctuations on the NOx formation. See NOx Formation in Turbulent Flows in the Theory Guide for details.

PDF Mode
is a drop-down list containing options that take into account turbulent fluctuations when you compute the specified NOx formation. See *Setting Turbulence Parameters* (p. 955) for details.

none
specifies the use of laminar NOx rate calculations, so that the effects of turbulence are ignored.

temperature
includes fluctuations of temperature.

temperature/species
includes fluctuations of the temperature and the mass fraction of the species selected in the **Species** drop-down list (which appears when you select this option).

mixture fraction
includes fluctuations of the mixture fraction(s). This is available for non-premixed combustion calculations only.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PDF Type
allows you to specify the shape of the PDF.

beta
models the PDF using Equation 14–108 in the Theory Guide.

gaussian
models the PDF using Equation 14–111 in the Theory Guide.

PDF Points
controls the number of points at which the beta function in Equation 14–105 or Equation 14–106 in the Theory Guide will be integrated. The default value of 10, which indicates that the beta function will be integrated at 10 points on a histogram basis. The default value should yield an accurate solution with a reasonable computation time. Increasing this value may improve accuracy, but will also increase the computation time. This text box is only available when **temperature** or **temperature/species** is selected from the **PDF Mode** drop-down list.

Temperature Variance
allows you to specify the form of the transport equation that is solved to calculate the temperature variance.

algebraic
is an approximate form of the transport equation (see Equation 14–114 in the Theory Guide).

transported
solves Equation 14–113 in the Theory Guide.

Tmax Option
provides various options for determining the maximum limit(s) for the integration of the PDF used to calculate the temperature.

global-tmax
sets the limit as the maximum temperature in the flow field.

local-tmax-factor
yieldscell-basedmaximumtemperaturelimitsby multiplying the local cell mean temperature by the value entered in **Tmax Factor**.

specified-tmax
sets the limit for each cell to be the value entered in **Tmax**.

user-defined
allows you to hook a user-defined function that specifies custom values for the maximum limit (T_{max}), which is used for the integration of the temperature PDF. This option is only available if you have already compiled a UDF and selected it in the **Formation** tab.

Species
is a drop-down list which appears when **temperature/species** is selected from the **PDF Mode** drop-down list. Here you will select the species whose mass fraction fluctuations will be factored into the NOx rate calculations.

Formation Model Parameters
contains the tabs used to define the NOx pathways.

Thermal
contains parameters for modeling thermal NOx. (The contents of this tab will appear only if **Thermal NOx** is enabled in the **Formation** tab.)

[O] Model
is a drop-down list in which you can select the method to be used for calculation of thermal NOx. To choose the equilibrium method, select **equilibrium**. To choose the partial equilibrium

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

method, select **partial-equilibrium**. To choose the predicted O concentration method, select **instantaneous**. See Method 1: Equilibrium Approach, Method 2: Partial Equilibrium Approach, and Method 3: Predicted O Approach in the Theory Guide for details.

[OH] Model

is a drop-down list in which you can select the method to be used for calculation of thermal NOx. To exclude OH, select **none**. To choose the partial equilibrium method, select **partial-equilibrium**. To choose the predicted OH concentration method, select **instantaneous**. See Method 1: Exclusion of OH Approach, Method 2: Partial Equilibrium Approach, and Method 3: Predicted OH Approach in the Theory Guide for details.

UDF Rate

provides options for the treatment of the NOx production specified by the UDF selected in the **Formation** tab.

Replace FLUENT Rate

replaces ANSYS FLUENT's thermal NOx rate calculations with the custom NOx rate produced by your UDF.

Add to FLUENT Rate

adds the custom NOx rate produced by your UDF to ANSYS FLUENT's thermal NOx rate calculations.

Prompt

contains parameters for modeling prompt NOx. (The contents of this tab will appear only if **Prompt NOx** is enabled in the **Formation** tab.) The settings made in this tab will be associated with a particular fuel stream, specified in the **Fuel Stream ID** text box in the **Formation** tab.

Fuel Carbon Number

specifies the number of carbon atoms per fuel molecule.

Equivalence Ratio

is the ratio of the actual fuel/air ratio to the stoichiometric fuel/air ratio.

UDF Rate

provides options for the treatment of the NOx production specified by the UDF selected in the **Formation** tab.

Replace FLUENT Rate

replaces ANSYS FLUENT's prompt NOx rate calculations with the custom NOx rate produced by your UDF.

Add to FLUENT Rate

adds the custom NOx rate produced by your UDF to ANSYS FLUENT's prompt NOx rate calculations.

Fuel

contains parameters for modeling fuel NOx. (The contents of this tab will appear only if **Fuel NOx** is enabled in the **Formation** tab.) The settings made in this tab will be associated with a particular fuel stream, specified in the **Fuel Stream ID** text box in the **Formation** tab.

Fuel Type

specifies the type of fuel NOx to be calculated.

Solid

enables the calculation of solid fuel NOx.

Liquid

enables the calculation of liquid fuel NOx.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Gas

enables the calculation of gas fuel NOx.

N Intermediate

allows you to specify any one of the **hcn**, **nh3**, or **hcn/nh3/no** as the intermediate species. See Fuel NOx Formation in the Theory Guide for details.

Volatile N Mass Fraction

specifies the mass fraction of nitrogen in the volatiles. This parameter appears only for **Solid** fuel NOx calculations.

Fuel N Mass Fraction

specifies the mass fraction of nitrogen in the fuel. This parameter appears only for **Gas** or **Liquid** fuel NOx calculations.

Conversion Fraction

specifies the overall mass fraction of fuel N (for gas and liquid fuels), or volatile N or char N (for solid fuels), that will be converted to intermediate species and/or product NO.

Partition Fractions

specifies the mass fraction of the converted fuel N (for gas and liquid fuels), or volatile N or char N (for solid fuels), that will become **hcn** and **nh3**. The fraction that will become NO will be calculated by the remainder. This option will appear only if you have selected **hcn/nh3/no** for the **N Intermediate** or **Char N Conversion** drop-down lists.

Char N Conversion

is a drop-down list in which you can select **no**, **hcn**, **nh3**, or **hcn/nh3/no** as the species to which the char N is converted (when you are calculating solid fuel NOx). This parameter appears only for **Solid** fuel NOx calculations. See *Setting Solid (Coal) Fuel NOx Parameters* (p. 950) for details.

Char N Mass Fraction

specifies the mass fraction of nitrogen in the char. This parameter appears only for **Solid** fuel NOx calculations.

BET Surface Area

sets the BET internal pore surface area (see BET Surface Area in the Theory Guide for details) of the particles. This parameter appears only for **Solid** fuel NOx calculations.

UDF Rate

provides options for the treatment of the NOx production specified by the UDF selected in the **Formation** tab.

Replace FLUENT Rate

replaces ANSYS FLUENT's fuel NOx rate calculations with the custom NOx rate produced by your UDF.

Add to FLUENT Rate

adds the custom NOx rate produced by your UDF to ANSYS FLUENT's fuel NOx rate calculations.

N2O Path

contains the method to be used for formation of NO through an N_2O intermediate. (The contents of this tab will appear only if **N20 Intermediate** is enabled in the **Formation** tab.)

N2O Model

contains the drop-down list of available N2O models.

quasi-steady

enables the quasi-steady-state method of calculation (The transport equation for the species N_2O will not be solved).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

transported-simple

enables the transported simple method of calculation (The pollutant species N_2O is added in the species list and it's mass fraction will be calculated using the transport equations).

UDF Rate

provides options for the treatment of the NOx production specified by the UDF selected in the **Formation** tab.

Replace ANSYS FLUENT Rate

replaces the NOx rate calculated by ANSYS FLUENT using N_2O intermediates with the custom NOx rate produced by your UDF.

Add to ANSYS FLUENT Rate

adds the custom NOx rate produced by your UDF to the NOx rate calculated by ANSYS FLUENT using N_2O intermediates.

Reduction Method Parameters

contains tabs that allow you to define the methods of reduction. (These tabs are do not appear unless a reduction method has been enabled in the **Reduction** tab.)

Reburn

allows you to define the NOx reduction when **Reburn** is enabled in the **Reduction** tab.

Reburn Model

contains the drop-down list of reburn methods.

instantaneous[CH]

activates instantaneous method in the **Reburn Model**. When you choose this method a warning to include CH, CH_2, and CH_3 will be displayed.

partial-equilibrium

activates partial method in the **Reburn Model**.

Reburn Fuel Species

contains reburn fuel species drop-down list.

Equivalent Fuel Type

contains equivalent fuel type drop-down list.

SNCR

allows you to define the NOx reduction when **SNCR** is enabled in the **Reduction** tab.

Injection Method

contains the parameters for NOx reduction by SNCR method.

gaseous

includes ammonia or urea as a gas-phase pollutant species from the injection locations.

liquid

includes ammonia or urea as a liquid-phase pollutant species from the injection locations.

Reagent Species

allows you to specify the reagent species as either ammonia (**nh3**) or urea (**co<nh2>2**)

Reagent Fraction in Stream

allows you to specify the mass fraction of the reagent in the reagent stream. The remaining mass fraction is assumed to be water. If you enabled a secondary stream in your PDF calculation, by default the secondary stream will act as the reagent stream. Note that the **Reagent Fraction in Stream** text box is only available when using the non-premixed combustion model with a liquid-phase reagent injection.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Urea Decomposition

allows you to specify the decomposition model to use when the selected **Reagent Species** is **co<nh2>2**.

rate-limiting

specifies that the source terms be calculated according to the rates given in Table 14.3: "Two-Step Urea Breakdown Process".

user-specified

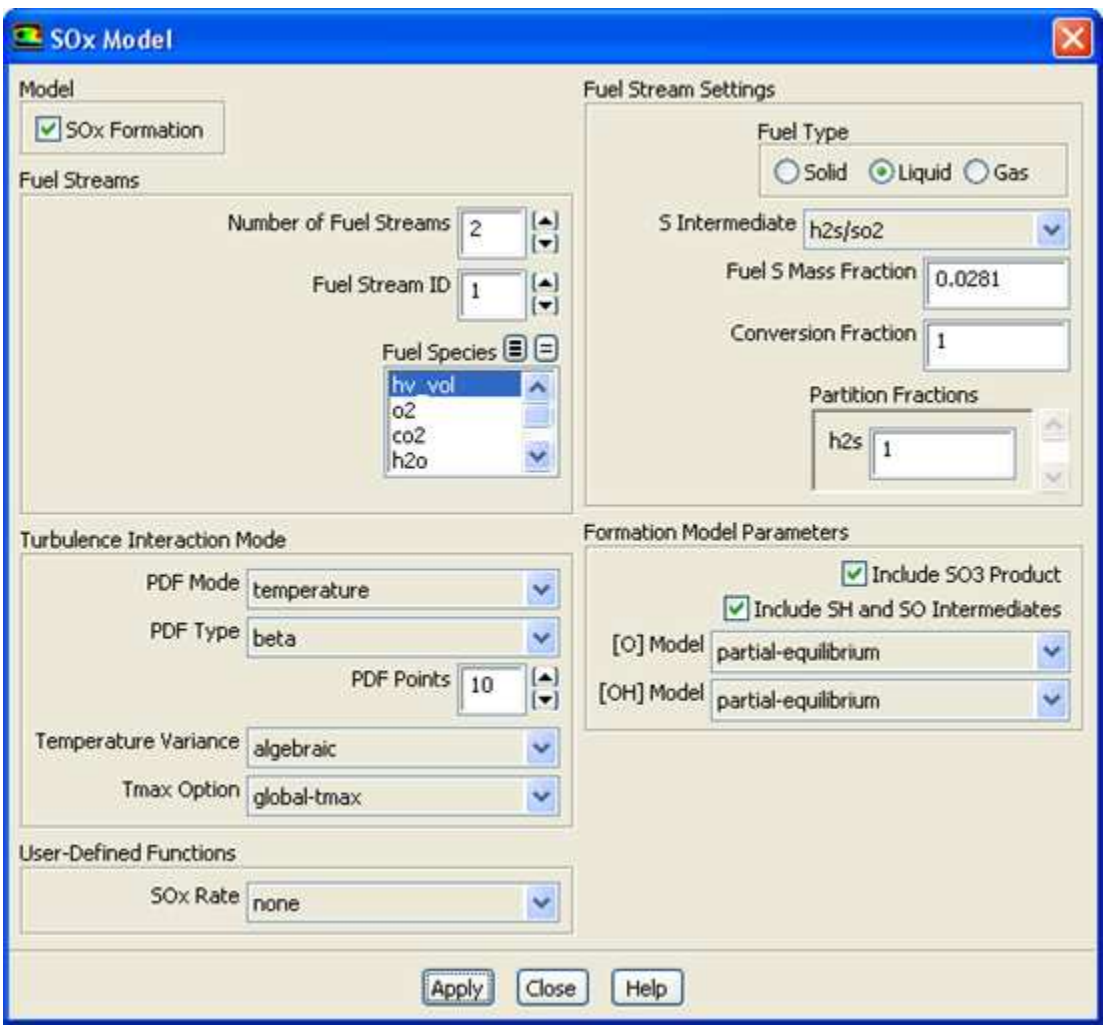
allows you to specify the molar conversion fraction for ammonia, assuming that the rest of the urea is converted to HNCO.

NH3 Conversion

is the mole fraction of NH_3 in the mixture of NH_3 and HNCO instantly created from the reagent injection. The **NH3 Conversion** text box only appears when **user-specified** is selected for **Urea Decomposition**.

35.3.29. SOx Model Dialog Box

The **SOx Model** dialog box allows you to set parameters related to the SOx postprocessor. See *Using the SOx Model* (p. 959) for details about the items below.



Controls

Model

contains the control to enable the model.

SOx Formation

enables the model.

Fuel Streams

allows you to define multiple fuel streams for SOx formation.

Number of Fuel Streams

sets the number of fuel streams. You are allowed up to three fuel streams.

Fuel Stream ID

specifies the fuel stream you are defining in the **Fuel Species** selection list and the **Formation Model Parameters** group box.

Fuel Species

is a list containing all of the defined species. This list is used to specify the species that is the fuel associated with a particular **Fuel Stream ID**, for any combustion model other than non-premixed combustion. You cannot select more than 5 fuel species for each fuel stream, and the total number of fuel species selected for all the fuel streams combined cannot exceed 10.

PDF Stream ID

specifies the PDF stream species associated with a particular **Fuel Stream ID**, when calculating SOx formation in conjunction with the non-premixed combustion model.

primary

indicates the primary fuel stream species, as defined in the PDF table.

secondary

indicates the secondary fuel stream species, as defined in the PDF table.

Turbulence Interaction Mode

contains parameters related to the effect of turbulent fluctuations on the SOx formation. See SOx Formation in Turbulent Flows in the Theory Guide for details.

PDF Mode

is a drop-down list containing options that take into account turbulent fluctuations when you compute the specified SO_2 formation. See *Setting Turbulence Parameters* (p. 955) for details.

none

specifies the use of laminar SOx rate calculations, so that the effects of turbulence are ignored.

temperature

includes fluctuations of temperature.

temperature/species

includes fluctuations of temperature and mass fraction of the species selected in the **Species** drop-down list (which appears when you select this option).

mixture fraction

includes fluctuations of the mixture fraction(s). This is available for non-premixed combustion calculations only.

PDF Type

allows you to specify the shape of the PDF.

beta

models the PDF using Equation 14–108 in the Theory Guide.

gaussian

models the PDF using Equation 14–111 in the Theory Guide.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PDF Points

controls the number of points at which the beta function in Equation 14–105 or Equation 14–106 in the Theory Guide will be integrated. The default value of 10, which indicates that the beta function will be integrated at 10 points on a histogram basis, will yield an accurate solution with reasonable computation time. Increasing this value may improve accuracy, but will also increase the computation time. This text box is only available when **temperature** or **temperature/species** is selected from the **PDF Mode** drop-down list.

Temperature Variance

allows you to specify the form of transport equation that is solved to calculate the temperature variance.

algebraic

is an approximate form of the transport equation (see Equation 14–114 in the Theory Guide).

transported

solves Equation 14–113 in the Theory Guide.

Tmax Option

provides various options for determining the maximum limit(s) for the integration of the PDF used to calculate the temperature.

global-tmax

sets the limit as the maximum temperature in the flow field.

local-tmax-factor

yields cell-based maximum temperature limits by multiplying the local cell mean temperature by the value entered in **Tmax Factor**.

specified-tmax

sets the limit for each cell to be the value entered in **Tmax**.

user-defined

allows you to hook a user-defined function that specifies custom values for the maximum limit (T_{max}), which is used for the integration of the temperature PDF. This option is only available if you have already compiled a UDF and selected it in the **SOx Rate** drop-down list in the **User-Defined Functions** group box.

Species

is a drop-down list which appears when **temperature/species** is selected from the **PDF Mode** drop-down list. Here you will select the species whose mass fraction fluctuations will be factored into the SOx rate calculations.

User-Defined Functions

allows you to use a user-defined function (UDF) to contribute to the rate of SOx production. See the separate UDF Manual for details. Note that you may also use a UDF to specify custom values for the maximum limit (T_{max}) that is used for the integration of the temperature PDF (when temperature is accounted for in the turbulence interaction modeling).

SOx Rate

allows you to select a compiled UDF.

UDF Rate

provides options for the treatment of the SOx production specified by the UDF.

Replace FLUENT Rate

replaces ANSYS FLUENT's SOx rate calculations with the custom SOx rate produced by your UDF.

Add to FLUENT Rate

adds the custom SOx rate produced by your UDF to ANSYS FLUENT's SOx rate calculations.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Fuel Stream Settings

contains the parameters associated with a particular fuel stream of the SOx model, as specified in the **Fuel Stream ID** text box in the **Fuel Streams** group box.

Fuel Type

enables selection of the fuel.

Solid

enables the calculation of solid fuel SOx.

Liquid

enables the calculation of liquid fuel SOx.

Gas

enables the calculation of gas fuel SOx.

S Intermediate

drop-down list enables you to select intermediate species (**h2s**, **so2**, or **h2s/so2**).

Volatile S Mass Fraction

specifies the mass fraction of sulfur in the volatiles. This parameter appears only for **Solid** fuel streams.

Fuel S Mass Fraction

field sets the value for correct mass fraction of sulfur in the fuel (kg sulfur per kg fuel). This parameter appears only for **Liquid** and **Gas** fuel streams.

Conversion Fraction

specifies the overall mass fraction of the fuel S (for liquid or gas fuels), or the volatile S or char S (for solid fuels), that will be converted to the intermediate species and/or product SO_2. The **S Intermediate Conversion Fraction** has a default value of 1.

Partition Fractions

specifies the mass fraction of the fuel S (for liquid or gas fuels), or the volatile S or char S (for solid fuels) that will become **h2s**. The remainder will become SO_2. This parameter only appears when you select **h2s/so2** for the **S Intermediate** or **Char S Conversion** drop-down lists.

Char S Conversion

drop-down list selects the char S conversion path as **so2**, **h2s**, or **so2/h2s**. This parameter appears only for **Solid** fuel streams.

Char S Mass Fraction

specifies the mass fraction of sulfur in the char. This parameter appears only for **Solid** fuel streams.

Formation Model Parameters

allows you to include SOx products and intermediates.

Include SO3 Product

includes **SO3** as a product in all of the fuel streams, as described in Reaction Mechanisms for Sulfur Oxidation in the Theory Guide.

Include SH and SO Intermediaries

includes **SH** and **SO** as intermediates in all of the fuel streams, as described in Reaction Mechanisms for Sulfur Oxidation in the Theory Guide.

[O] Model

drop-down list specifies the method by which **O** will be calculated in all of the fuel streams, i.e., **equilibrium**, **partial-equilibrium**, or **instantaneous** in the **[O] Model**.

[OH] Model

drop-down list specifies the method by which **OH** will be calculated in all of the fuel streams, i.e., **equilibrium**, **partial-equilibrium**, or **instantaneous** in the **[OH] Model**.

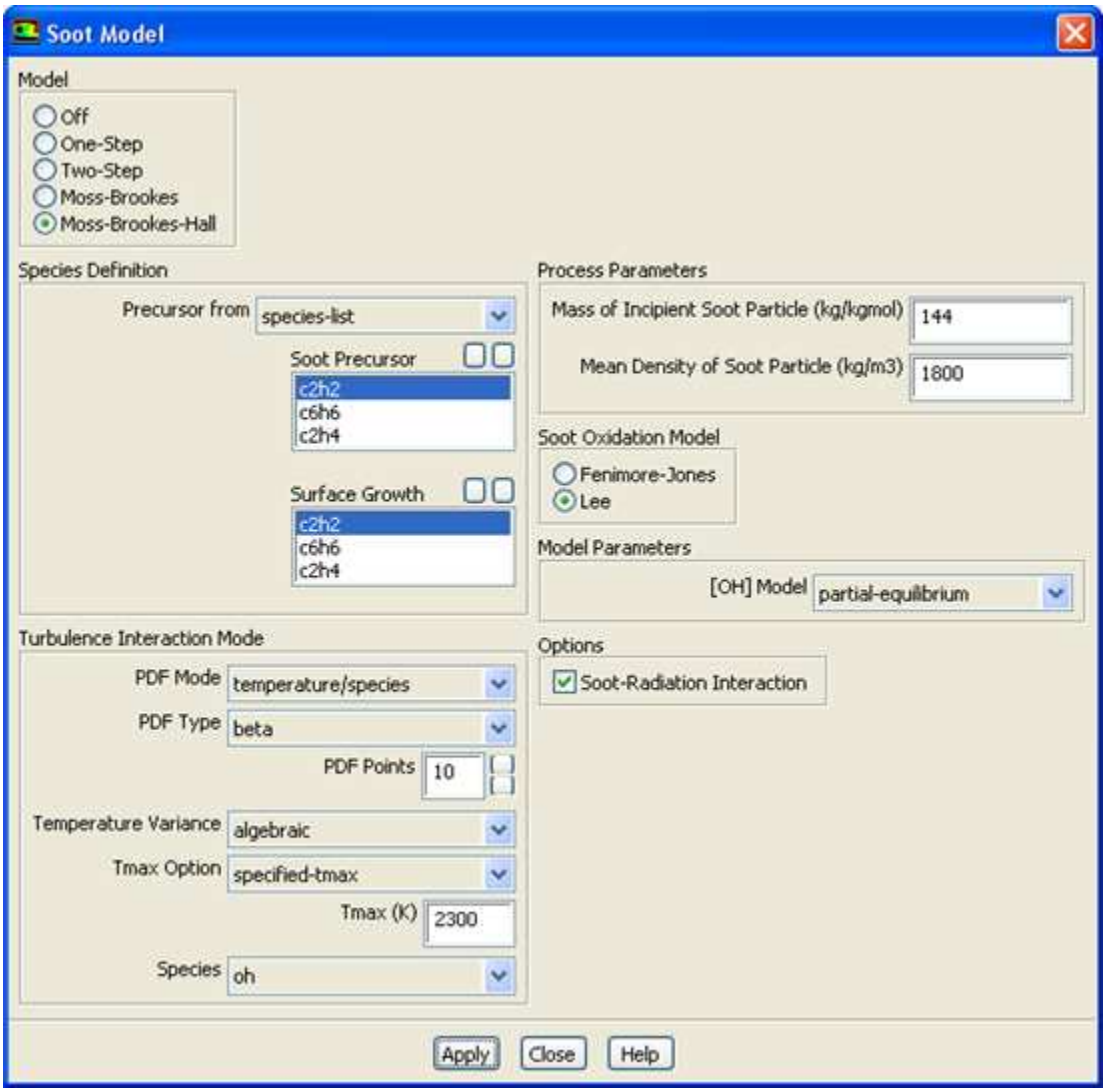
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Important

To use the predicted O and/or OH concentration, select **instantaneous** in the **[O] Model** or **[OH] Model** drop-down list.

35.3.30. Soot Model Dialog Box

The **Soot Model** dialog box allows you to set parameters related to the soot model. See *Using the Soot Models* (p. 973) for details about the items below.



Controls

Model

specifies which model should be used for computing soot formation.

Off

disables the calculation of soot formation.

One-Step

enables the one-step soot model described in The One-Step Soot Formation Model in the Theory Guide.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Two-Step
enables the two-step soot model described in The Two-Step Soot Formation Model.

Moss-Brookes
enables the Moss-Brookes soot model described in The Moss-Brookes Model in the Theory Guide.

Moss-Brookes-Hall
enables the Moss-Brookes-Hall soot model described in The Moss-Brookes-Hall Model in the Theory Guide. This option is only available when C_2H_2, C_6H_6, C_6H_5, and H_2 are present in the gas phase species list.

Species Definition
contains inputs for specifying the chemical species for your model.

Fuel
is a drop-down list containing all of the defined species. Here you will select the species that is the fuel for the **One-Step** and **Two-Step** models, as well as the **Moss-Brookes** model when a precursor species is not identified in the defined species list.

Oxidant
is a drop-down list containing all of the defined species. Here you will select the species that is the oxidizer for the **One-Step** and **Two-Step** models.

Precursor from
allows you to select from a list of species or enter the correlation values of species. This selection is available when using the **Moss-Brookes** and **Moss-Brookes-Hall** models.

Soot Precursor
is a selection list containing all of the possible precursor species found via a query of the defined species list. By default, ANSYS FLUENT only considers `c2h2`, `c6h6`, and `c2h4` as possible precursor species. For information about including other species in the possible precursor species search, contact your ANSYS FLUENT support engineer. From this list you will select the species that are the soot precursor species for the **Moss-Brookes** and **Moss-Brookes-Hall** models.

Surface Growth
is a selection list containing all of the possible surface growth species, as explained previously for the **Soot Precursor** selection list. Here you will select the species that are the surface growth species for the **Moss-Brookes** and **Moss-Brookes-Hall** models.

Fuel Carbon Number
is the number of carbon atoms in the species selected in the **Fuel** drop-down list. This text box appears only for the **Moss-Brookes** and **Moss-Brookes-Hall** model, when **user-correlation** is selected in the **Precursor from** drop-down list.

Fuel Hydrogen Number
is the number of hydrogen atoms in the species selected in the **Fuel** drop-down list. This text box appears only for the **Moss-Brookes** and **Moss-Brookes-Hall** model, when **user-correlation** is selected in the **Precursor from** drop-down list.

Molecular Weight of Precursor
is the molecular weight of the precursor species. This text box appears only for the **Moss-Brookes** and **Moss-Brookes-Hall** model, when **user-correlation** is selected in the **Precursor from** drop-down list. The default value is the weight of acetylene.

Precursor Correlation
is a drop-down list you can use to define a laminar diffusion profile which relates mixture fraction to precursor mass fraction. This text box appears only for the **Moss-Brookes** and **Moss-Brookes-Hall** model, when **user-correlation** is selected in the **Precursor from** drop-down list.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

piecewise-polynomial
specifies that the precursor mass fraction is a piecewise-polynomial function of mixture fraction. The default values used by ANSYS FLUENT correspond to a methane diffusion flame simulation, in which both the air and fuel initial temperatures are set to 290 K, and acetylene is assumed as the soot precursor. These values can be revised via the **Edit...** button.

constant
specifies that the precursor mass fraction is a constant function of mixture fraction, the value of which is specified in the text box below the **Precursor Correlation** drop-down list.

Edit...
opens the *Piecewise-Polynomial Profile Dialog Box* (p. 1752)when **piecewise-polynomial** is selected from the **Precursor Correlation** drop-down list, thus allowing you to revise the default values.

Turbulence Interaction Mode
contains inputs that specify how turbulent fluctuations are accounted for in the soot formation calculations for the **Moss-Brookes** and **Moss-Brookes-Hall** models. For further details on these inputs, see *Setting Up the Moss-Brookes Model and the Hall Extension* (p. 978).

PDF Mode
is a drop-down list that contains the options for addressing turbulent fluctuations in the soot rate calculations. Note that **mixture fraction** is the most accurate option, and should be used if it is available.

none
specifies the use of laminar soot rate calculations, so that the effects of turbulence are ignored.

temperature
specifies that the soot rate calculations include the effect of temperature fluctuations.

temperature/species
specifies that the soot rate calculations include the effect of fluctuations of temperature, as well as fluctuations of the mass fraction of the species selected in the **Species** drop-down list (which appears when you select this option).

mixture fraction
is the most accurate option, specifying that the soot rate calculations include the effect of fluctuations of mixture fraction(s). Note that this option is not available if you are using the eddy-dissipation model.

PDF Type
allows you to specify the shape of the PDF.

beta
models the PDF using Equation 14–108 in the Theory Guide.

gaussian
models the PDF using Equation 14–111 in the Theory Guide.

PDF Points
controls the number of points at which the beta function will be integrated on a histogram basis. Increasing this number may improve accuracy, but will also increase compute time. This text box is only available when **temperature** or **temperature/species** is selected from the **PDF Mode** drop-down list.

Temperature Variance
allows you to specify the form of transport equation that is solved to calculate the temperature variance.

algebraic
is an approximate form of the transport equation (see Equation 14–114 in the Theory Guide).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

transported
solves Equation 14–113 in the Theory Guide.

Tmax Option
provides various options for determining the maximum limit(s) for the integration of the PDF used to calculate the temperature.

global-tmax
sets the limit as the maximum temperature in the flow field.

local-tmax-factor
yields cell-based maximum temperature limits by multiplying the local cell mean temperature by the value entered in **Tmax Factor**.

specified-tmax
sets the limit for each cell to be the value entered in **Tmax**.

user-defined
allows you to hook a user-defined function that specifies custom values for the maximum limit (T_{max}), which is used for the integration of the temperature PDF. This option is only available if you have already compiled a UDF.

Species
is a drop-down list which appears when **temperature/species** is selected from the **PDF Mode** drop-down list. Here you will select the species whose mass fraction fluctuations will be factored into the soot rate calculations.

Process Parameters
contains parameters that control the combustion process modeling.

Mean Diameter of Soot Particle
is the assumed average diameter of the soot particles in the combustion system, used to compute the soot particle mass m_p in Equation 14–134 in the Theory Guide for the **Two-Step** model.

Mean Density of Soot Particle
is the assumed average density of the soot particles in the combustion system. For the **Two-Step** model, it is used to compute the soot particle mass m_p in Equation 14–134 in the Theory Guide. For the **Moss-Brookes** and **Moss-Brookes-Hall** models, it is ρ_{soot} in Equation 14–141 and ρ in Equation 14–144 in the Theory Guide. The default value supplied by ANSYS FLUENT is 1800 kg/m^3 (as was used in the work of Brookes and Moss [*12*] (p. 2209)).

Stoichiometry for Soot Combustion
is the mass stoichiometry v_{soot} in Equation 14–131 in the Theory Guide, which computes the soot combustion rate in the **One-Step** and **Two-Step** models. The default value supplied by ANSYS FLUENT (2.6667) assumes that the soot is pure carbon and that the oxidizer is O_2.

Stoichiometry for Fuel Combustion
is the mass stoichiometry v_{fuel} in Equation 14–131 in the Theory Guide, which computes the soot combustion rate in the **One-Step** and **Two-Step** models. The default value supplied by ANSYS FLUENT (3.6363) is for combustion of propane (C_3H_8) by oxygen (O_2).

Mass of Incipient Soot Particle
is M_P in Equation 14–142 and Equation 14–144, which is used in the **Moss-Brookes** and **Moss-Brookes-Hall** model computations. The default value supplied by ANSYS FLUENT (144 kg/mol) is the mass of 12 carbon atoms. Note that for the original implementation of the Hall extension, the model assumed this mass to be 100 carbon atoms.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Soot Oxidation Model

contains model options that determine the form of the soot oxidation term in the calculations of the **Moss-Brookes** and **Moss-Brookes-Hall** models.

Fenimore-Jones

takes into account the soot oxidation due to the hydroxyl radical.

Lee

takes into account the soot oxidation due to the hydroxyl radical and molecular oxygen.

Model Parameters

contains parameters that control the soot formation model.

Soot Formation Constant

is the parameter C_s in Equation 14–128 in the Theory Guide. This item appears only for the **One-Step** soot model.

Equivalence Ratio Exponent

is the exponent r in Equation 14–128 in the Theory Guide. This item appears only for the **One-Step** soot model.

Equivalence Ratio Minimum

and **Equivalence Ratio Maximum** are the minimum and maximum values of the fuel equivalence ratio ϕ in Equation 14–128 in the Theory Guide. Equation 14–128 will be solved only if **Equivalence Ratio Minimum**$< \phi <$ **Equivalence Ratio Maximum**; if ϕ is outside of this range, there is no soot formation. This item appears only for the **One-Step** soot model.

Activation Temperature of Soot Formation Rate

is the term E/R in Equation 14–128 in the Theory Guide. This item appears only for the **One-Step** soot model.

Magnussen Constant for Soot Combustion

is the constant A used in the rate expressions governing the soot combustion rate (Equation 14–130 and Equation 14–131) in the Theory Guide. This item appears only for the **One-Step** and the **Two-Step** soot models. For the **Two-Step** model, this input will be called **Magnussen Constant for Soot and Nuclei Combustion**.

Limiting Nuclei Formation Rate

is the limiting value of the kinetic nuclei formation rate η_0 in Equation 14–137 in the Theory Guide.

Below this limiting value, the branching and termination term, $(f-g)$ in Equation 14–136 in the Theory Guide, is not included. This item appears only for the **Two-Step** soot model.

Nuclei Branching-Termination Coefficient

is the term $(f-g)$ in Equation 14–136 in the Theory Guide. This item appears only for the **Two-Step** soot model.

Nuclei Coefficient of Linear Termination on Soot

is the term g_0 in Equation 14–136 in the Theory Guide. This item appears only for the **Two-Step** soot model.

Pre-Exponential Constant of Nuclei Formation

is the pre-exponential term a_0 in the kinetic nuclei formation term, Equation 14–137 in the Theory Guide. This item appears only for the **Two-Step** soot model.

Activation Temperature of Nuclei Formation Rate

is the term E/R in the kinetic nuclei formation term, Equation 14–137 in the Theory Guide. This item appears only for the **Two-Step** soot model.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Alpha for Soot Formation Rate
is α, the constant in the soot formation rate equation, Equation 14–134 **Two-Step** soot model.

Beta for Soot Formation Rate
is β, the constant in the soot formation rate equation, Equation 14–134 in the Theory Guide. This item appears only for the **Two-Step** soot model.

Magnussen Constant for Soot and Nuclei Combustion
is the constant A used in the rate expressions governing the soot combustion rate (Equation 14–130 and Equation 14–131 in the Theory Guide). This item appears only for the **One-Step** and the **Two-Step** soot models.

[OH] Model
is a drop-down list that allows you to specify the method by which the OH radical concentration is calculated, i.e., **instantaneous** or **partial-equilibrium**. This list appears only for the **Moss-Brookes** and the **Moss-Brookes-Hall** soot models.

[O] Model
is a drop-down list that specifies the method by which the O radical concentration is calculated, i.e., **equilibrium**, **partial-equilibrium**, or **instantaneous**. This list appears only for the **Moss-Brookes** and the **Moss-Brookes-Hall** soot models, when you have selected **partial-equilibrium** for the **[OH] Model**.

Important

To use the concentration of OH or O predicted by the combustion model, select **instantaneous** for **[OH] Model**or **[O] Model**.

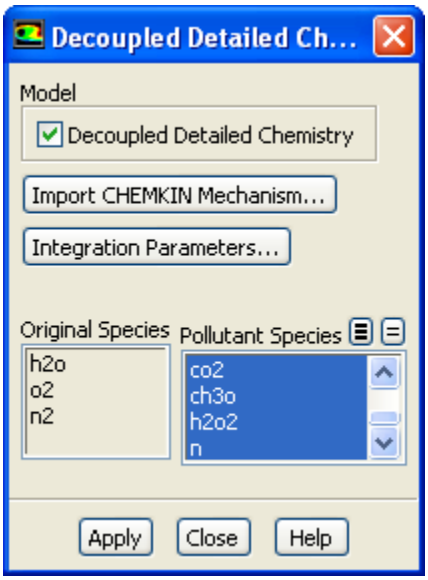
Options
contains an option for modeling the effect of soot on a variable radiation absorption coefficient. This group box will appear only when one of the radiation models in the *Radiation Model Dialog Box* (p. 1657) is active.

Soot-Radiation Interaction
enables the soot-radiation interaction model described in The Effect of Soot on the Absorption Coefficient in the Theory Guide.

35.3.31. Decoupled Detailed Chemistry Dialog Box

The **Decoupled Detailed Chemistry** dialog box allows you to postprocess slowly-forming, trace pollutant species on a steady-state flow field using detailed chemical kinetic mechanisms.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Model
includes the option to enable **Decoupled Detailed Chemistry**.

Import CHEMKIN Mechanism...
opens the *CHEMKIN Mechanism Import Dialog Box* (p. 2055).

Integration Parameters...
opens the *Integration Parameters Dialog Box* (p. 1694).

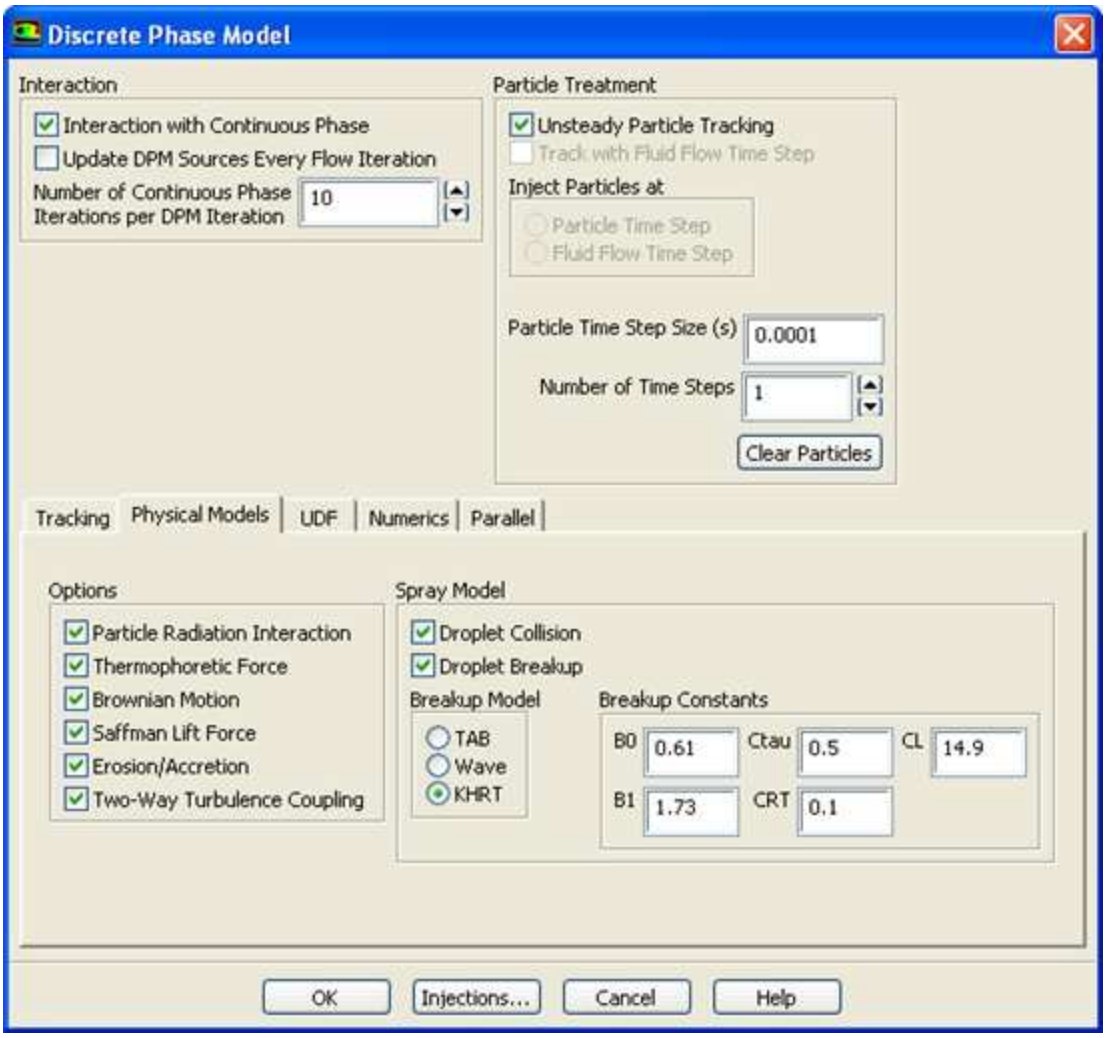
Original Species
are the species that are in the original case setup.

Pollutant Species
are typically slowly forming (far from chemical equilibrium), and occur at miniscule mass fractions.

35.3.32. Discrete Phase Model Dialog Box

The **Discrete Phase Model** dialog box allows you to set parameters related to the calculation of a discrete phase of particles. See *Modeling Discrete Phase* (p. 1007) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Interaction

contains parameters used for performing coupled calculations of the continuous and discrete phase flow. See *Procedures for a Coupled Two-Phase Flow* (p. 1065) for details.

Interaction with Continuous Phase

enables a coupled calculation of the discrete phase and the continuous phase.

Update DPM Sources Every Flow Iteration

enables calculation of particle source terms at every DPM Iteration. It is recommended for unsteady simulations.

Number of Continuous Phase Iterations per DPM Iteration

allows you to control the frequency at which the particles are tracked and the DPM sources are updated.

Particle Treatment

contains options for choosing to treat the particles in an unsteady or a steady fashion.

Unsteady Particle Tracking

enables unsteady tracking of particles.

Track with Fluid Flow Time Step

enables the use of fluid flow time steps to inject the particles.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Inject Particles at
contains parameters to decide when to inject the particles for a new time step.

Particle Time Step
enables injection of particles for every particle time step.

Fluid Flow Time Step
enables injection of particles for every fluid flow time step. In any case, the particles will always be tracked in such a way that they coincide with the flow time of the continuous flow solver.

Particle Time Step Size
specifies particle time step size for the calculation.

Number of Time Steps
allows you to specify the number of time steps for the calculation.

Clear Particles
clears the particles that are currently in the domain.

Tracking
contains two parameters to control the time integration of the particle trajectory equations.

Tracking Parameters
contains parameters that control the tracking of particle trajectories. One simple rule of thumb to follow when setting the two parameters below is that if you want the particles to advance through a domain of length D, the **Length Scale** times the number of **Max. Number of Steps** should be approximately equal to D. See Integration of Particle Equation of Motion in the Theory Guide for details about the items below.

Max. Number of Steps
is the maximum number of time steps used to compute a single particle trajectory via integration of Equation 16–1 in the Theory Guide and Equation 16–50.

Specify Length Scale
when enabled allows you to specify the length scale.

Length Scale
controls the integration time step size used to integrate the equations of motion for the particle. It appears only when the **Specify Length Scale** option is enabled.

Step Length Factor
specifies the value of λ in *Equation 25–2* (p. 1014).

Drag Parameters
allows the setting of the drag law used in calculating the force balance on the particles. See Particle Force Balance in the Theory Guide for details on the items below.

Drag Law
is a drop-down list containing three choices:

spherical
assumes that the particles are smooth spheres.

nonspherical
assumes that the particles are not spheres, but are all identically shaped. The shape is specified by the **Shape Factor**.

Stokes-Cunningham
is for use with sub-micron particles. A **Cunningham Correction** is added to Stokes' drag law to determine the drag.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

high-Mach-number
is similar to the spherical law with corrections to account for a particle Mach number greater than 0.4 or a particle Reynolds number greater than 20.

dynamic-drag
accounts for the effects of droplet distortion. This drag law is available only when one of the droplet breakup models is used in conjunction with unsteady tracking. See Dynamic Drag Model Theory in the Theory Guide for details.

Shape Factor
specifies the shape of the particles when **nonspherical** is selected as the **Drag Law** (ϕ in Equation 16–66 in the Theory Guide). It is the ratio of the surface area of a sphere having the same volume as the particle to the actual surface area of the particle. The shape factor value cannot be greater than 1.

Cunningham Correction
(C_c in Equation 16–68 in the Theory Guide) is used with Stokes' drag law to determine the force acting on the particles when the particles are sub-micron size. It appears when **Stokes-Cunningham** is selected as the **Drag Law**.

Physical Models
contains optional discrete phase models and their relevant parameters.

Options
contains additional models that can be included in the calculation. See *Physical Models for the Discrete Phase Model* (p. 1015) for more information.

Particle Radiation Interaction
includes the effect of radiation heat transfer to the particles (Equation 5–34 in the Theory Guide). You will also need to define additional properties for the particle materials (emissivity and scattering factor), as described in *Description of the Properties* (p. 1059).

This item appears only if the P-1 or discrete ordinates model is selected in the *Radiation Model Dialog Box* (p. 1657).

Thermophoretic Force
enables the inclusion of a thermophoretic force on the particles as an additional force term. See Thermophoretic Force in the Theory Guide for details.

Brownian Motion
enables the incorporation of the effects of Brownian motion. See Brownian Force in the Theory Guide for details.

Saffman Lift Force
enables the inclusion of Saffman's lift force (lift due to shear) as an additional force term. See Saffman's Lift Force in the Theory Guide for details.

Erosion/Accretion
enables the monitoring of erosion/accretion rates at wall boundaries. See *Monitoring Erosion/Accretion of Particles at Walls* (p. 1017) for details. This item appears only if **Interaction with Continuous Phase** is enabled.

Two-Way Turbulence Coupling
enables the effect of change in turbulent quantities due to particle damping and turbulence eddies.

Spray Model
contains parameters that control droplet breakup and collision. (This section of the dialog box appears only if **Unsteady Tracking** is enabled.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Droplet Collision
includes the effect of droplet collisions. See Droplet Collision and Coalescence Model Theory in the Theory Guide for details.

Droplet Breakup
includes the effects of droplet breakup.

Breakup Model
contains parameters that control droplet breakup. (This item appears only if **Droplet Breakup** is enabled.)

TAB
enables the Taylor Analogy Breakup (TAB) model, which is applicable to many engineering sprays. This method is based upon Taylor's analogy between an oscillating and distorting droplet and a spring mass system. See Taylor Analogy Breakup (TAB) Model in the Theory Guide for details.

Wave
enables the Wave breakup model, which considers the breakup of the injected liquid to be induced by the relative velocity between the gas and liquid phases. See Wave Breakup Model for details.

KHRT
enables the Kelvin-Helmholtz Rayleigh-Taylor breakup model, which considers the two competing effects of aerodynamic breakup and instabilities due to droplet acceleration. See KHRT Breakup Model for details.

Breakup Constants
contains model constants used in the equations for spray breakup. (This item appears only if **Droplet Breakup** is enabled.)

y0
(only for the TAB model) is the constant y_0 in Equation 16–258 in the Theory Guide.

Breakup Parcels
is the number of child parcels the droplet is split into, as described in Velocity of Child Droplets in the Theory Guide.

B0
(only for the Wave and KHRT models) is the constant B_0 in Equation 16–284 in the Theory Guide.

B1
(only for the Wave and KHRT models) is the constant B_1 in Equation 16–286 in the Theory Guide.

Ctau
(only for the KHRT model) is the constant C_τ in Equation 16–291 in the Theory Guide.

CRT
(only for the KHRT model) is the constant C_{RT} in Equation 16–292 in the Theory Guide.

CL
(only for the KHRT model) is the constant C_L in Equation 16–287 in the Theory Guide.

UDF
contains parameters that can be used to customize the discrete phase model using UDF. See the separate UDF Manual for details about user-defined functions.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

User-Defined Functions
lists will show available user-defined functions that can be selected to customize the discrete phase model.

Body Force
contains a drop-down list of user-defined functions available for including additional body forces.

Erosion/Accretion
contains a drop-down list of user-defined functions available for incorporating non-standard erosion rate definitions. This itemwill appear only when the **Erosion/Accretion** option has been enabled.

Scalar Update
contains a drop-down list of user-defined functions available for calculating or integrating scalar values along the particle trajectory.

Source
contains a drop-down list of user-defined functions available for modifying interphase exchange terms.

Spray Collide Function
contains a drop-down list of user-defined functions available for modifying spray collide function.

DPM Timestep
contains a drop-down list of user-defined functions available for modifying DPM time step.

User Variables
lists the user input variables.

Number of Scalars
sets the number of scalar values used in the calculations with user-defined functions.

Numerics
tab gives you control over the numerical schemes for particle tracking as well as solutions of heat and mass equations. See *Numerics of the Discrete Phase Model* (p. 1019) for details.

Options
contains parameters of solutions of heat and mass equations.

Accuracy Control
enables the solution of equations of motion within a specified tolerance.

Tolerance
is the maximum relative error which has to be achieved by the tracking procedure.

Max. Refinements
is the maximum number of step size refinements in one single integration step. If this number is exceeded the integration will be conducted with the last refined integration step size.

Coupled Heat-Mass Solution
enables the solution of the particle heat and mass equations using a stiff, coupled ODE solver with error tolerance control. See *Including Coupled Heat-Mass Solution Effects on the Particles* (p. 1021) for details.

Track in Absolute Frame
enables tracking the particles in the absolute reference frame.

Tracking Scheme Selection
contains parameters for selection of numerical schemes.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Automated
enables a mechanism to switch in an automated fashion between numerically stable lower order schemes and higher order schemes, which are stable only in a limited range.

High Order Scheme
can be chosen from the group consisting of **trapezoidal** and **runge-kutta** scheme.

Low Order Scheme
consists of **implicit** and the exponential **analytic** integration scheme.

Tracking Scheme
allows to choose any of the tracking schemes. You also can combine each of the tracking schemes with Accuracy Control. It is selectable only if **Automated** is switched off.

Parallel
contains parameters that control the compute nodes for performing discrete phase calculations in parallel. See *Parallel Processing for the Discrete Phase Model* (p. 1087) for details.

Methods
allows you to select the mode for parallel processing. This group box is editable only for the parallel version of ANSYS FLUENT; for the serial version, the **Shared Memory** option (see the description that follows) is selected by default.

Message Passing
enables cluster computing and also works on shared memory machines. With this option, the compute node processes themselves perform the particle work on their local partitions and particle migration to other compute nodes is implemented using message passing primitives. No special requirements are placed on the host machine. Note that this model is not available if the **Cloud Model** option is enabled in the **Turbulent Dispersion** tab of the **Set Injection Properties** dialog box. The **Message Passing** option is irrelevant for the serial ANSYS FLUENT code while the **Shared Memory** option remains valid.

Shared Memory
allows you to specify parameters for performing the calculations on shared-memory multiprocessor machines. Note that this option is not available on Windows 2000 or the `ntx86` platform (32–bit Windows).

Hybrid
allows you to combine **Message Passing** (as previously described) and **OpenMP** for a dynamic load balancing without migration of cells. This option enables multicore cluster computing, and also works on shared-memory machines. When using the **Hybrid** option, you can control the maximum number of threads on each machine via the **Thread Control** dialog box (see *Controlling the Threads* (p. 1625) for details). Note that this option is not available for the `ntx86` platform (32–bit Windows), nor is it available if the **Cloud Model** option is enabled in the **Turbulent Dispersion** tab of the **Set Injection Properties** dialog box.

Shared Memory Options
contains settings for the **Shared Memory** option. This group box is only available if **Shared Memory** is selected from the **Methods** list.

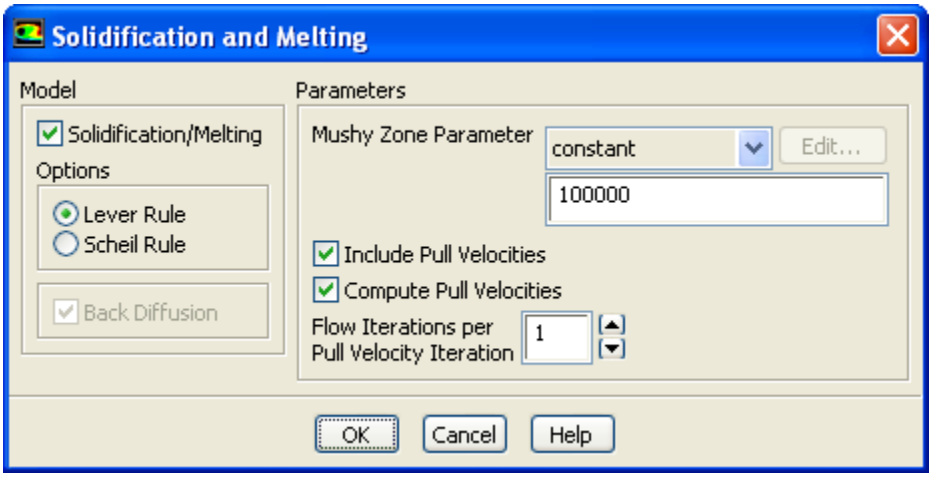
Workpile Algorithm
specifies that the discrete phase calculations are to be performed on a shared-memory multiprocessor machine.

Number of Threads
specifies the number of threads to be used in performing the particle calculations. By default, this parameter is equal to the number of compute nodes you specified for the parallel solver. (This item appears only if **Workpile Algorithm** is enabled.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.3.33. Solidification and Melting Dialog Box

The **Solidification and Melting** dialog box allows you to set parameters related to the solidification/melting model. See *Modeling Solidification and Melting* (p. 1201) for details about the items below.



Controls

Model

contains the option for turning on the model.

Solidification/Melting

enables/disables the modeling of solidification and/or melting.

Options

gives you the option of selecting one of two model rules.

Lever Rule

allows you to use the Lever rule (Equation 18–14 in the Theory Guide).

Scheil Rule

allows you to use the Scheil rule (Equation 18–18 in the Theory Guide). If you select **Scheil Rule**, then you can enable **Back Diffusion**. Enter either a **constant** or a user defined function to specify the value of the **Back Diffusion Parameter**, used in Equation 18–19 to Equation 18–21 in the Theory Guide. Please refer to DEFINE_SOLIDIFICATION_PARAMS of the UDF Manual for detailed information about the user defined function.

Parameters

contains parameters related to the solidification/melting model.

Mushy Zone Constant

sets the value of A_{mush} in Equation 18–6 in the Theory Guide.

Include Pull Velocities

includes pull velocities in the model, as described in Momentum Equations and Pull Velocity for Continuous Casting in the Theory Guide.

Compute Pull Velocities

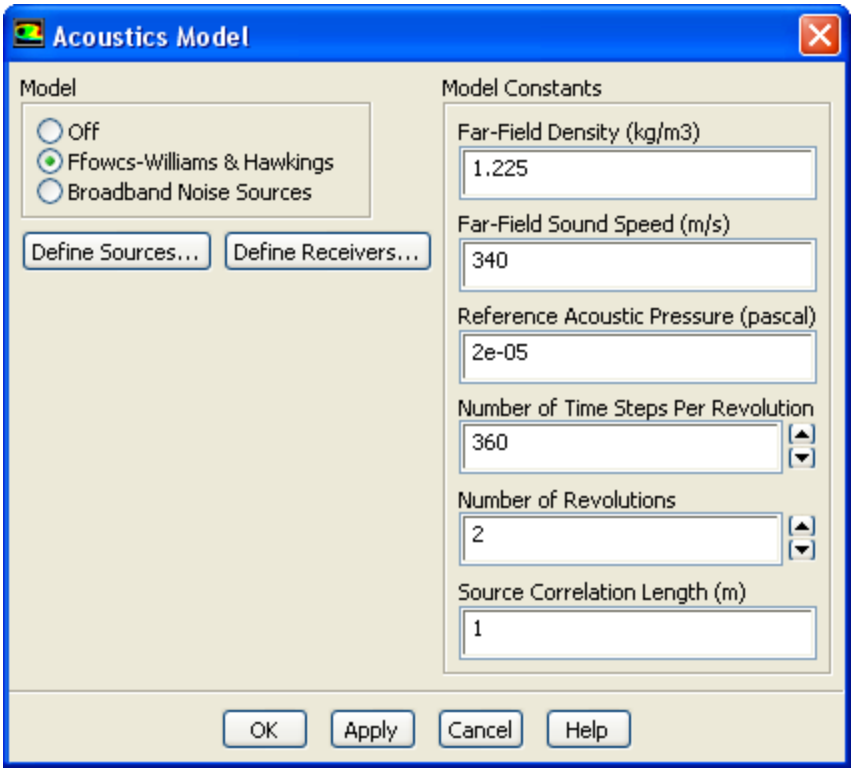
enables the calculation of pull velocities based on the specified velocity boundary conditions, as described in Pull Velocity for Continuous Casting in the Theory Guide. This option appears when **Include Pull Velocities** is turned on.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Flow Iterations per Pull Velocity Iteration
specifies the number of times the pull velocity equations will be solved after each iteration of the solver. This option appears when **Compute Pull Velocities** is turned on.

35.3.34. Acoustics Model Dialog Box

The **Acoustics Models** dialog box allows you to set parameters related to the acoustics model. See *Using the Ffowcs Williams and Hawkings Acoustics Model* (p. 989) for details about the items below.



Controls

Model
contains the option for turning on the acoustics model.

Off
disables the acoustics model.

Ffowcs-Williams & Hawkings
enables the Ffowcs Williams and Hawkings (FW-H) acoustics model. See *Postprocessing the FW-H Acoustics Model Data* (p. 1000) for details.

Broadband Noise Sources
enables the broadband noise acoustics model. See *Using the Broadband Noise Source Models* (p. 1003) for details.

Model Constants
contains parameters related to the acoustics model.

Far-Field Density
sets the value of the far-field fluid density (ρ_0 in Equation 15–1 in the Theory Guide).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Far-Field Sound Speed
sets the speed of the sound at the far-field (a_0 in Equation 15–5 and Equation 15–6 in the Theory Guide).

Reference Acoustic Pressure
is used to calculate the sound pressure level in dB.

Reference Acoustic Power
is used to non-dimensionalize the acoustic power, giving the sound pressure level in dB (see *Fast Fourier Transform (FFT) Postprocessing* (p. 1500)). This parameter is equal to 4×10^{-10} W for airborne sound and 10^{-12} W for underwater sound.

Reference Acoustic Intensity
is defined as $p_{ref}^2/\left(\rho_0 a_0\right)$, although this quantity is not currently used by ANSYS FLUENT.

Source Correlation Length
is required when sound is to be computed using a 2D flow result. The FW-H integrals will be evaluated over this length in the depthwise direction using the identical source data.

Number of Realizations
is the number of times the noise source terms will be computed through the generation of stochastic turbulent velocity field.

Number of Fourier Modes
is the number of terms in the Fourier summation from which the turbulent velocity field and its derivatives are computed.

Number of Time Steps Per Revolution
is available only for steady-state cases that have a single moving reference frame. Here you will specify the number of equivalent time steps that it will take for the rotating zone to complete one revolution.

Number of Revolutions
is available only for steady-state cases that have a single moving reference frame. Here you will specify the number of revolutions that will be simulated in the model.

Options
contains the parameters related to **Ffowcs-Williams & Hawkings** model.

Export Acoustic Source Data in ASD Format
enables/disables the saving of source data files in ASD format.

Export Acoustic Source Data in CGNS Format
enables/disables the saving of source data files in CGNS format.

Compute Acoustics Signals Simultaneously
enables "on-the-fly" calculation of sound. When this option is chosen, the ANSYS FLUENT console window will print a message at the end of each time step indicating that the sound pressure signals have been computed (e.g., `Extracting sound signals at x receiver locations...`, where `x` is the number of receivers you specified). Enabling this option instructs ANSYS FLUENT to compute sound pressure signals at the end of each time step, which will slightly increase the computation time.

Define Sources...
opens the *Acoustic Sources Dialog Box* (p. 1733), which allows you to specify the acoustics sources.

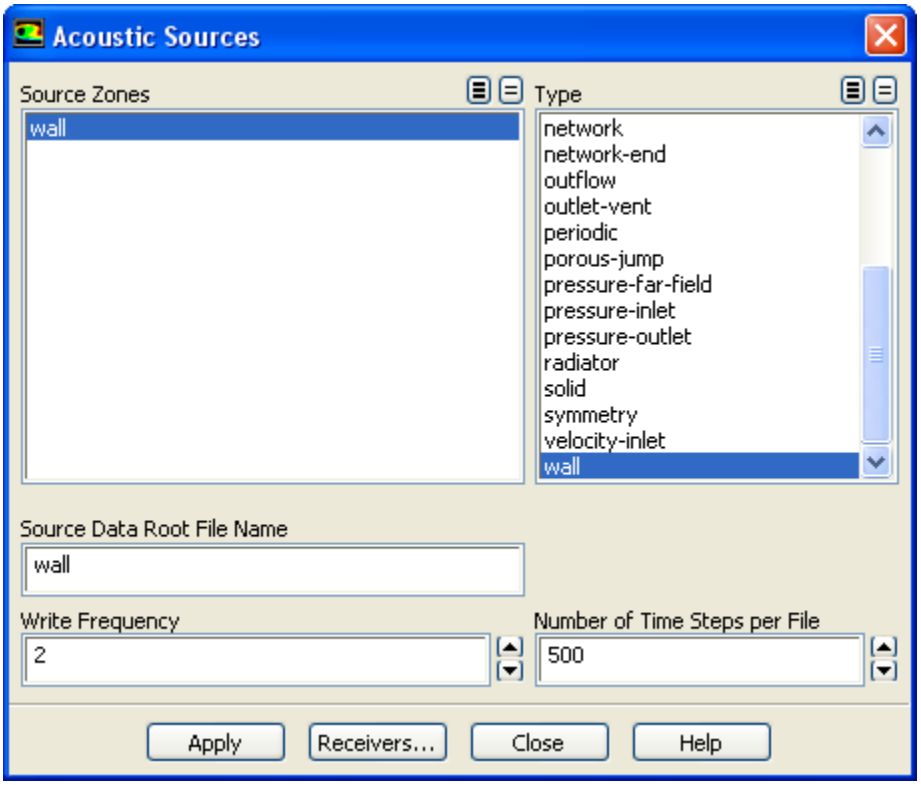
Define Receivers...
opens the *Acoustic Receivers Dialog Box* (p. 1734), which allows you to specify the location of the receivers.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Apply
saves the acoustics model settings.

35.3.35. Acoustic Sources Dialog Box

The **Acoustic Sources** dialog box allows you to specify the acoustics sources. See *Using the Ffowcs Williams and Hawkings Acoustics Model* (p. 989) for details about the items below.



Controls

Source Zones
contains a list of zones from which you can select one or more emission (source) surfaces.

Type
contains a list of all possible types of zones from which you can select one or more types of the available zones. If you select an available type of zone, the relevant zones will then be selected in the **Source Zones** list. If you specify any valid **interior** zones as source surfaces, the *Interior Cell Zone Selection Dialog Box* (p. 1734) will appear.

Source Data Root File Name
is used to give the names of the source data files (e.g., `acoustic_example_xxxx.asd`, where `xxxx`is the global time-step index of the transient solution) and an index file (e.g., `acoustic_example.index`) that will store the information associated with the source data.

Write Frequency
allows you to control how often the source data will be written. This will enable you to save disk space if the time-step size used in the transient flow simulation is smaller than necessary to resolve the sound frequency you are attempting to predict.

Number of Time Steps per File
allows you to write the source data to multiple files, each containing the source data for a number of time steps specified by you.

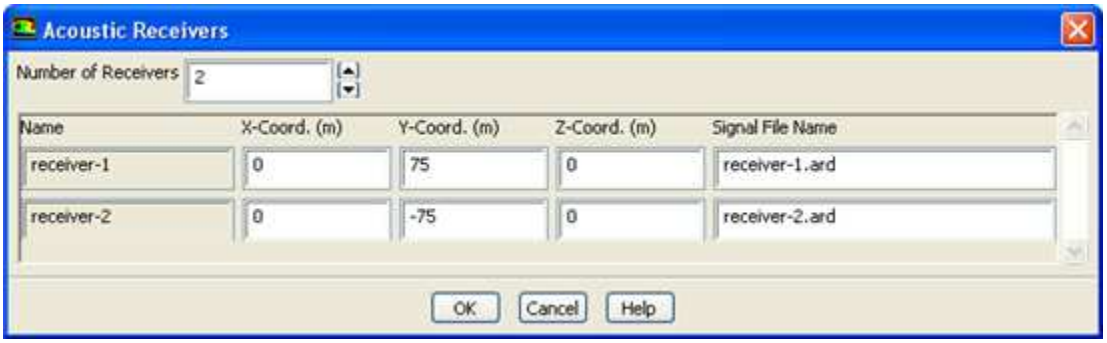
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Receivers...

opens the *Acoustic Receivers Dialog Box* (p. 1734), which allows you to specify the location of the receivers.

35.3.36. Acoustic Receivers Dialog Box

The **Acoustic Receivers** dialog box allows you to specify the location of the acoustic receivers. See *Using the Ffowcs Williams and Hawkings Acoustics Model* (p. 989) for details about the items below.



Controls

Number of Receivers

allows you to specify the total number of receivers for which you want to compute sound.

Name

shows the name of the receiver. If you edit the field, the new name will take effect after you click the **OK** button.

X-Coord., Y-Coord., Z-Coord.

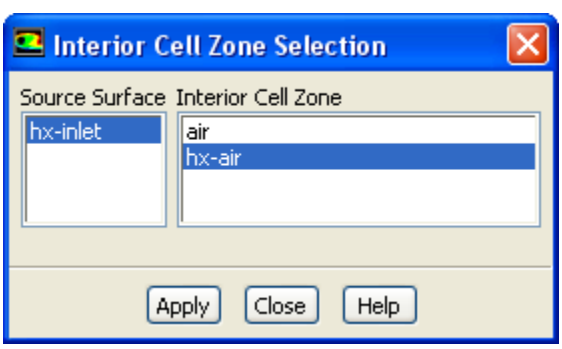
specifies the coordinates for each receiver. Note that because ANSYS FLUENT's acoustics model is ideally suited for far-field noise prediction, the receiver locations you define should be at a reasonable distance from the sources of sound (i.e., the selected acoustic surface), and can fall outside of the computational domain if needed.

Signal File Name

specifies the name of the file used to store sound pressure signals for the corresponding receivers. By default, the files will be named `receiver-1.dat`, `receiver-2.dat`, etc.

35.3.37. Interior Cell Zone Selection Dialog Box

The **Interior Cell Zone Selection** dialog box allows you to specify the acoustics sources. See *Specifying Source Surfaces* (p. 995) for details about the items below.



Controls

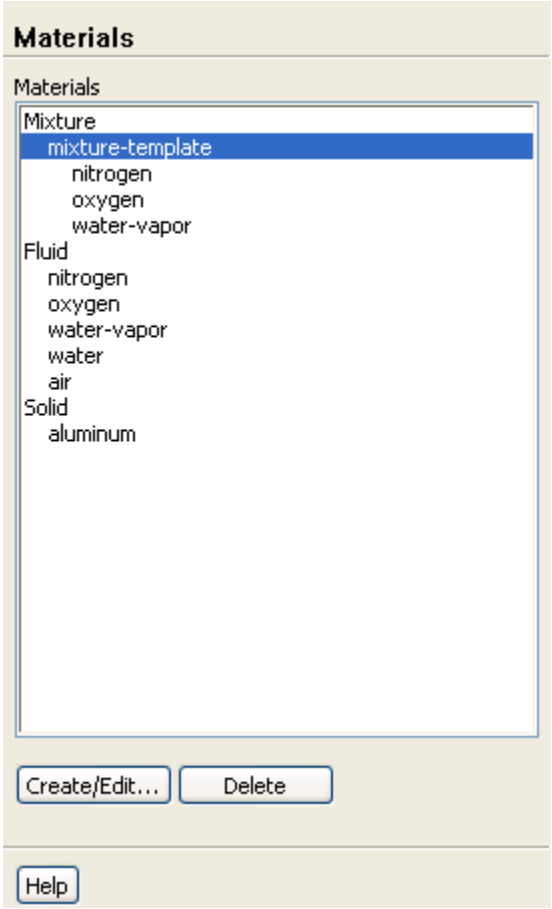
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Source Surface
displays the selected interior surface.

Interior Cell Zone
contains a list of two interior cell zones, from which you will select the zone that is occupied by the quadrupole sources.

35.4. Materials Task Page

The **Materials** task page allows you to set properties for any fluid or solid (or mixture, if applicable) materials in your ANSYS FLUENT simulation.



Controls

Materials
contains a listing of available fluid or solid (or mixture, if applicable) materials.

Create/Edit...
displays the *Create/Edit Materials Dialog Box* (p. 1736) for the selected item in the **Materials** list.

Delete
removes the selected material from the **Materials** list,

For additional information, please see the following sections:

35.4.1. Create/Edit Materials Dialog Box
35.4.2. FLUENT Database Materials Dialog Box
35.4.3. Open Database Dialog Box

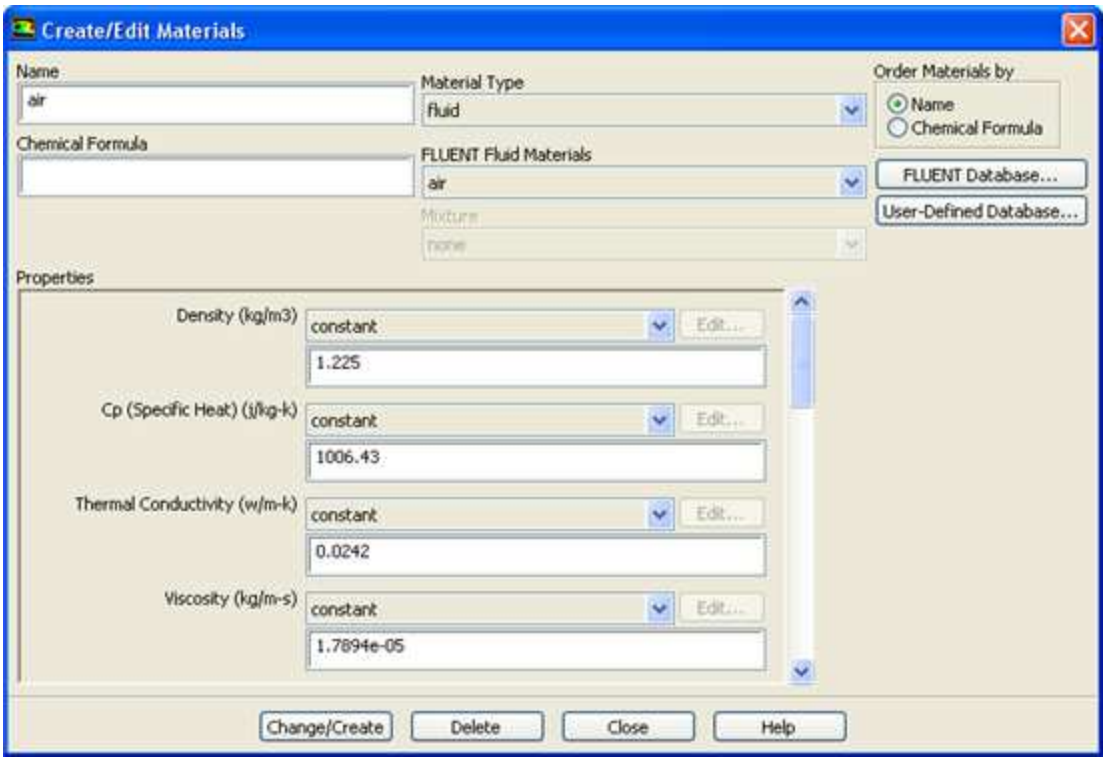
35.4.42. Edit Material Dialog Box
35.4.43. Fluent Database Materials Dialog Box

35.4.1. Create/Edit Materials Dialog Box

The **Create/Edit Materials** dialog box is used to create and modify materials. Materials can be downloaded from the global database or defined locally. See *Physical Properties* (p. 385) for details about defining material properties. *Using the Materials Task Page* (p. 387) describes how to use the dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

shows the name of the material. If you edit this field, the new name will take effect when you click on **Change/Create**.

Chemical Formula

displays the chemical formula for the material. You should generally not edit this field unless you are creating a material from scratch.

Material Type

is a drop-down list containing all of the available material types. By default, **fluid** and **solid** will be the only choices. If you are modeling species transport/combustion, **mixture** will also be available. For problems in which you have defined discrete-phase injections, **inert-particle**, **droplet-particle**, and/or **combusting-particle** will also appear.

FLUENT Fluid Materials

allows you to choose the fluid material for which you want to modify properties. This option is available when **fluid** is selected in the **Material Type** drop-down list.

FLUENT Solid Materials

allows you to choose the solid material for which you want to modify properties. This option is available when **solid** is selected in the **Material Type** drop-down list.

FLUENT Mixture Materials

allows you to choose the mixture material for which you want to modify properties. This option is available when **mixture** is selected in the **Material Type** drop-down list.

FLUENT Droplet Particle Materials

allows you to choose the droplet-particle for which you want to modify properties. This option is available when **droplet-particle** is selected in the **Material Type** drop-down list.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Order Materials by

allows you to order the materials in the **Materials** list alphabetically by **Name** or alphabetically by **Chemical Formula**.

FLUENT Database...

opens the *FLUENT Database Materials Dialog Box* (p. 1744), from where you can copy materials from the global database into the current solver.

User-Defined Database...

opens the *Open Database Dialog Box* (p. 1746), where you can specify the user-defined database to be used.

Properties

contains input fields for the material properties that are required for the active physical models.

Density

sets the material density. You may set a constant value, or select one of the other methods from the drop-down list above the real number field. See *Density* (p. 403) for instructions on setting density. This quantity can be assigned to a new input parameter (indicated by the **New Input Parameter...** option in the drop-down list). Clicking this option displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters. You can also assign this quantity to compatible (based on units) input parameters that are already available in the drop-down list.

Cp (Specific Heat)

sets the constant-pressure specific heat of the material. You may set a constant value, or select one of the other methods from the drop-down list above the real number field. See *Specific Heat Capacity* (p. 433) for instructions on setting specific heat. This quantity can be assigned to a new input parameter (indicated by the **New Input Parameter...** option in the drop-down list). Clicking this option displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters. You can also assign this quantity to compatible (based on units) input parameters that are already available in the drop-down list.

Thermal Conductivity

sets the thermal conductivity of the material. You may set a constant value, or select one of the other methods from the drop-down list above the real number field. See *Thermal Conductivity* (p. 418) for instructions on setting thermal conductivity. This quantity can be assigned to a new input parameter (indicated by the **New Input Parameter...** option in the drop-down list). Clicking this option displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters. You can also assign this quantity to compatible (based on units) input parameters that are already available in the drop-down list.

Viscosity

sets the viscosity of the material. You may set a constant value, or select one of the other methods from the drop-down list above the real number field. See *Viscosity* (p. 408) for instructions on setting viscosity. This quantity can be assigned to a new input parameter (indicated by the **New Input Parameter...** option in the drop-down list). Clicking this option displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters. You can also assign this quantity to compatible (based on units) input parameters that are already available in the drop-down list.

Molecular Weight

sets the molecular weight of the material. It is used to derive the gas constant of the material. This quantity can be assigned to a new input parameter (indicated by the **New Input Parameter...** option in the drop-down list). Clicking this option displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters. You can also assign this quantity to compatible (based on units) input parameters that are already available in the drop-down list.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Standard State Enthalpy

specifies the formation enthalpy of a fluid material for a reacting flow. See *Standard State Enthalpies* (p. 447) for details.

Standard State Entropy

specifies the standard state entropy of a fluid material for a reacting flow. This input is used only if the fluid material is involved in a reversible reaction. See *Standard State Entropies* (p. 447) for details.

Reference Temperature

specifies the reference temperature for the **Heat of Formation**.

L-J Characteristic Length

specifies the kinetic theory parameter σ for a fluid material. See *Kinetic Theory Parameters* (p. 448) for details.

L-J Energy Parameter

specifies the kinetic theory parameter ε/k for a fluid material. See *Kinetic Theory Parameters* (p. 448) for details.

Absorption Coefficient

specifies the absorption coefficient a for radiation heat transfer. See *Radiation Properties* (p. 435) for details. If you choose the **wsggm-user-specified** option from the drop-down list next to **Absorption Coefficient**, the *WSGGM User Specified Dialog Box* (p. 1776) will open. If you choose the **user-defined-wsggm** option from the drop-down list next to **Absorption Coefficient**, the *User-Defined Functions Dialog Box* (p. 1753) will open.

Scattering Coefficient

specifies the scattering coefficient σ_s for radiation heat transfer (only for the P-1, Rosseland, or DO radiation model). See *Radiation Properties* (p. 435) for details.

Scattering Phase Function

specifies an **isotropic** (by default) or **linear-anisotropic** scattering function. If you are using the DO model, **delta-eddington** and **user-defined** scattering functions are also available. See *Radiation Properties* (p. 435) for details. If you choose **delta-eddington**, the *Delta-Eddington Scattering Function Dialog Box* (p. 1777) will open.

Refractive Index

specifies the refractive index for the material. It is used only when semi-transparent media are modeled with the DO radiation model.

Mixture Species

specifies the names of the species that comprise a mixture material. To check or modify these names, click on the **Edit...** button to open the *Species Dialog Box* (p. 1763). This property appears only for mixture materials.

Reaction

displays the reaction mechanism being used when you are modeling finite-rate reactions. **finite-rate** appears if **LaminarFinite-Rate**or **Eddy-Dissipation Concept** is selected in the *Species Model Dialog Box* (p. 1681), **eddy-dissipation** appears if **Eddy-Dissipation** is selected, and **finite-rate/eddy-dissipation** appears if **Finite-Rate/Eddy-Dissipation** is selected.

Click **Edit...** to open the *Reactions Dialog Box* (p. 1765).

Mechanism

allows you to enable different reactions selectively in different geometrical zones. Click the **Edit** button to open the *Reaction Mechanisms Dialog Box* (p. 1771). See *Defining Zone-Based Reaction Mechanisms* (p. 816) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mass Diffusivity

contains a drop-down list of available methods for specifying the diffusion coefficients for the species in a mixture material. If you select **constant-dilute-appx**, you will enter a constant value in the field below. If you select **dilute-approx** or **multicomponent**, the *Mass Diffusion Coefficients Dialog Box* (p. 1773) will open, and you can specify the coefficients there. If you select **kinetic-theory**, you will need to specify the kinetic theory parameters for the individual fluid materials (species) that comprise the mixture. See *Mass Diffusion Coefficients* (p. 438) for details about specifying mass diffusivity. This quantity can be assigned to a new input parameter (indicated by the **New Input Parameter...** option in the drop-down list). Clicking this option displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters. You can also assign this quantity to compatible (based on units) input parameters that are already available in the drop-down list.

Thermal Diffusion Coefficient

contains a drop-down list of available methods for specifying the thermal diffusion coefficients for the species in a mixture material. If you select **kinetic-theory**, you will need to specify the kinetic theory materials (species) that comprise the mixture. If you select **specified**, the *Thermal Diffusion Coefficients Dialog Box* (p. 1774) will open, and you can specify the coefficients there. See *Thermal Diffusion Coefficient Inputs* (p. 445) for details about specifying thermal diffusion coefficients.

Density of Unburnt Reactants

sets the density (ρ_u in Equation 9–67 in the Theory Guide) of the unburnt products.

Temperature of Unburnt Reactants

sets the temperature (T_u in Equation 9–67 in the Theory Guide) of the unburnt products.

Adiabatic Temperature of Burnt Products

(only for adiabatic premixed combustion models) specifies the value of the burnt products under adiabatic conditions, T_{ad} in Equation 9–64 in the Theory Guide.

Molecular Heat Transfer Coefficient

specifies the molecular heat transfer coefficient (α in Equation 9–9 in the Theory Guide) for use with the premixed combustion model. See *Modeling Premixed Combustion* (p. 893) for details.

Laminar Flame Speed

specifies the value of U_l in Equation 9–9 in the Theory Guide.

Laminar Flame Thickness

specifies the thickness of the flame for which you have a choice of **constant**, **user-defined**, or **diffusivity-over-flame-speed**.

Critical Rate of Strain

specifies the value of g_{cr} in Equation 9–17 in the Theory Guide.

Heat of Combustion

(only for non-adiabatic premixed combustion models) specifies the value of H_{comb} in Equation 9–66 in the Theory Guide.

Unburnt Fuel Mass Fraction

(only for non-adiabatic premixed combustion models) specifies the value of Y_{fuel} in Equation 9–66 in the Theory Guide.

Thermal Expansion Coefficient

specifies the thermal expansion coefficient (β in *Equation 14–2* (p. 697)) for use with the Boussinesq approximation. See *Steps in Solving Buoyancy-Driven Flow Problems* (p. 698) for details.

Droplet Surface Tension

specifies the value of the droplet surface tension (σ in Equation 16–226 in the Theory Guide).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Latent Heat

is the latent heat of vaporization, h_{fg}, required for phase change from an evaporating liquid droplet or for the evolution of volatiles from a combusting particle. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Latent Heat at NBP

is the latent heat of vaporization at the normal boiling point, available for droplet-particles. See *Using the Cubic Equation of State Models with the Lagrangian Dispersed Phase Models* (p. 465) for details.

Normal Boiling Point (NBP)

is given by *Equation 8–105* (p. 467). See *Using the Cubic Equation of State Models with the Lagrangian Dispersed Phase Models* (p. 465) for details.

Thermophoretic Coefficient

specifies the thermophoretic coefficient ($D_{T,p}$ in Equation 16–8 in the Theory Guide), and appears when the thermophoretic force is included in the discrete phase calculation.

Vaporization Temperature

is the temperature, T_{vap}, at which the calculation of vaporization from a liquid droplet or devolatilization from a combusting particle is initiated by ANSYS FLUENT. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Boiling Point

is the temperature, T_{bp}, at which the calculation of the boiling rate equation is initiated by ANSYS FLUENT. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Vapor-Particle-Equilibrium

is the selected approach for the calculation of the vapor concentration of the components at the surface. This can be Raoult's law (Equation 16–159 in the Theory Guide), the Peng-Robinson real gas model (Equation 16–168 in the Theory Guide), or a user-defined function that provides this value.

Volatile Component Fraction

(f_{v0}) is the fraction of a droplet particle that may vaporize via Laws 2 and/or 3 (Droplet Vaporization (Law 2) in the Theory Guide). For combusting particles, it is the fraction of volatiles that may be evolved via Law 4 (Devolatilization (Law 4) in the Theory Guide). See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Binary Diffusivity

is the mass diffusion coefficient, $D_{i,m}$, used in the vaporization law, Law 2. This input is also used to define the mass diffusion of the oxidizing species to the surface of a combusting particle, $D_{i,m}$. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Saturation Vapor Pressure

is the saturated vapor pressure, P_{sat}, defined as a function of temperature, which is used in the vaporization law, Law 2. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Heat of Pyrolysis

is the heat of the instantaneous pyrolysis reaction, h_{pyrol}, that the evaporating/boiling species may undergo when released to the continuous phase. The heat of pyrolysis should be input as a positive number for exothermic reaction and as a negative number for endothermic reaction. The default value of zero implies that the heat of pyrolysis is not considered. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Degrees of Freedom

specifies the kinetic theory parameter f, which is the number of nodes of energy storage. This parameter is required only if you are defining specific heat via kinetic theory. See *Kinetic Theory Parameters* (p. 448) for details.

Particle Emissivity

is the emissivity of particles in your model, ε_p, used to compute radiation heat transfer to the particles when the P-1 or DO radiation model is active and particle radiation interaction is enabled in the *Discrete Phase Model Dialog Box* (p. 1723). See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Particle Scattering Factor

is the scattering factor, f, due to particles in the P-1 or DO radiation model. Note that this property will appear only if particle radiation interaction is enabled in the *Discrete Phase Model Dialog Box* (p. 1723). See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Swelling Coefficient

is the coefficient, C_{sw}, which governs the swelling of the coal particle during the devolatilization law, Law 4. A swelling coefficient of unity (the default) implies that the coal particle stays at constant diameter during the devolatilization process. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Burnout Stoichiometric Ratio

is the stoichiometric requirement, S_b, for the burnout reaction, in terms of mass of oxidant per mass of char in the particle. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Combustible Fraction

is the mass fraction of char, f_{comb}, in the coal particle, i.e., the fraction of the initial combusting particle that will react in the surface reaction, Law 5. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

React. Heat Fraction Absorbed by Solid

is the parameter f_h, which controls the distribution of the heat of reaction between the particle and the continuous phase. The default value of zero implies that the entire heat of reaction is released to the continuous phase. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Heat of Reaction for Burnout

is the heat released by the surface char combustion reaction, Law 5. This parameter is input in terms of heat release (e.g., Joules) per unit mass of char consumed in the surface reaction. See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Devolatilization Model

defines which version of the devolatilization model, Law 4, is being used. If you want to use the default constant rate devolatilization model, retain the selection of **constant** in the drop-down list to the right of **Devolatilization Model** and input the rate constant A_0 in the field below the list.

Choose **single-rate**, **two-competing-rates**, or **cpd-model** in the drop-down list to activate one of the optional devolatilization models (the single kinetic rate model, two kinetic rates model, or CPD model, as described in Devolatilization (Law 4) in the Theory Guide).

When the single kinetic rate model (**single-rate**) is selected, the *Single Rate Devolatilization Dialog Box* (p. 1778) will appear; when the two competing rates model (**two-competing-rates**) is selected, the *Two Competing Rates Model Dialog Box* (p. 1779) will appear; and when the CPD model (**cpd-model**) is selected, the *CPD Model Dialog Box* (p. 1780) will appear.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Combustion Model

defines which version of the surface char combustion law (Law 5) is being used. If you want to use the default diffusion-limited rate model, retain the selection of **diffusion-limited** in the drop-down list. No additional inputs are necessary, because the binary diffusivity defined above will be used in Equation 16–136 in the Theory Guide.

To use the kinetics/diffusion-limited rate model for the surface combustion model, select **kinetics/diffusion-limited** in the drop-down list and enter the parameters in the resulting *Kinetics/Diffusion-Limited Combustion Model Dialog Box* (p. 1780).

To use the intrinsic model for the surface combustion model, select **intrinsic-model** in the drop-down list and enter the parameters in the resulting *Intrinsic Combustion Model Dialog Box* (p. 1781).

To use the multiple surface reactions model, select **multiple-surface-reactions** in the drop-down list.

See *Setting Material Properties for the Discrete Phase* (p. 1054) for details.

Pure Solvent Melting Heat

specifies the latent heat for the melting and solidification model (L in Equation 18–2 in the Theory Guide).

Solidus Temperature

specifies the solidus temperature for the melting and solidification model ($T_{solidus}$ in Equation 18–2 in the Theory Guide). If you are solving for species transport, the solidus temperature is $T_{solidus}$ in Equation 18–8, and you specify the method by which it is calculated: either according to the **mixing-law** (which is based on the parameters of the solutes) or a **user-defined** function.

Liquidus Temperature

specifies the liquidus temperature for the melting and solidification model ($T_{liquidus}$ in Equation 18–2 in the Theory Guide). If you are solving for species transport, the liquidus temperature is T_{liquidus} in Equation 18–9, and you specify the method by which it is calculated: either according to the **mixing-law** (which is based on the parameters of the solutes) or a **user-defined** function.

Pure Solvent Melting Temperature

specifies the melting temperature of pure solvent (T_{melt} in Equation 18–8 and Equation 18–9 in the Theory Guide) for the melting and solidification model when species transport has also been enabled. The solvent is the last species listed under of the mixture material.

Eutectic Temperature

is the lowest alloy melting temperature, which depends on the relative proportions of the mixture composition of the Eutectic species mass fractions.

Slope of Liquidus Line

specifies the slope of the liquidus surface with respect to the concentration of the solute (m_i in Equation 18–8 and Equation 18–9 in the Theory Guide). It is not necessary to specify this value for the solvent. Note that this option is available only for the melting and solidification model when species transport has also been enabled.

Partition Coefficient

specifies the partition coefficient with respect to the concentration of the solute fluid (K_i in Equation 18–8 and Equation 18–9 in the Theory Guide). It is not necessary to specify this value for the solvent. Note that this option is available only for the melting and solidification model when species transport has also been enabled.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Eutectic Mass Fraction
is the mass fraction of a solute in an alloy at which the melting temperature of the alloy is the lowest possible value ($Y_{i,\mathrm{Eut}}$ in Equation 18–10in the Theory Guide). It is not necessary to specify this value for the solvent. Note that this option is available only for the melting and solidification model when species transport has also been enabled.

Diffusion in Solid
specifies the rate of diffusion in the solid. Note that this option is available only for the melting and solidification model when the Lever rule is selected and the species transport is enabled.

UDS Diffusivity
specifies the diffusion coefficient for a user-defined scalar. This material property is available in the *Create/Edit Materials Dialog Box* (p. 1736) when you specify one or more user-defined scalars in the *User-Defined Scalars Dialog Box* (p. 2113). If you select **defined-per-uds**, you will need to specify the diffusion coefficient for each user-defined scalar transport equation in the *UDS Diffusion Coefficients Dialog Box* (p. 1775). This quantity can be assigned to a new input parameter (indicated by the **New Input Parameter...** option in the drop-down list). Clicking this option displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters. You can also assign this quantity to compatible (based on units) input parameters that are already available in the drop-down list.

When you are viewing the database, additional properties may be displayed. However, after you copy the material to the local area, only the properties with relevance to the current problem will be displayed.

Change/Create
changes the properties of a locally-stored material or creates a new one in the local area. If no material with the specified **Name** exists locally, ANSYS FLUENT will create it. If you have modified the material without changing its name, ANSYS FLUENT will simply update the material with your modifications. If you have assigned a new name to the material and a material with this name already exists locally, an error will be indicated; you must then specify a different name or delete the existing material with that name before trying to save the new material.

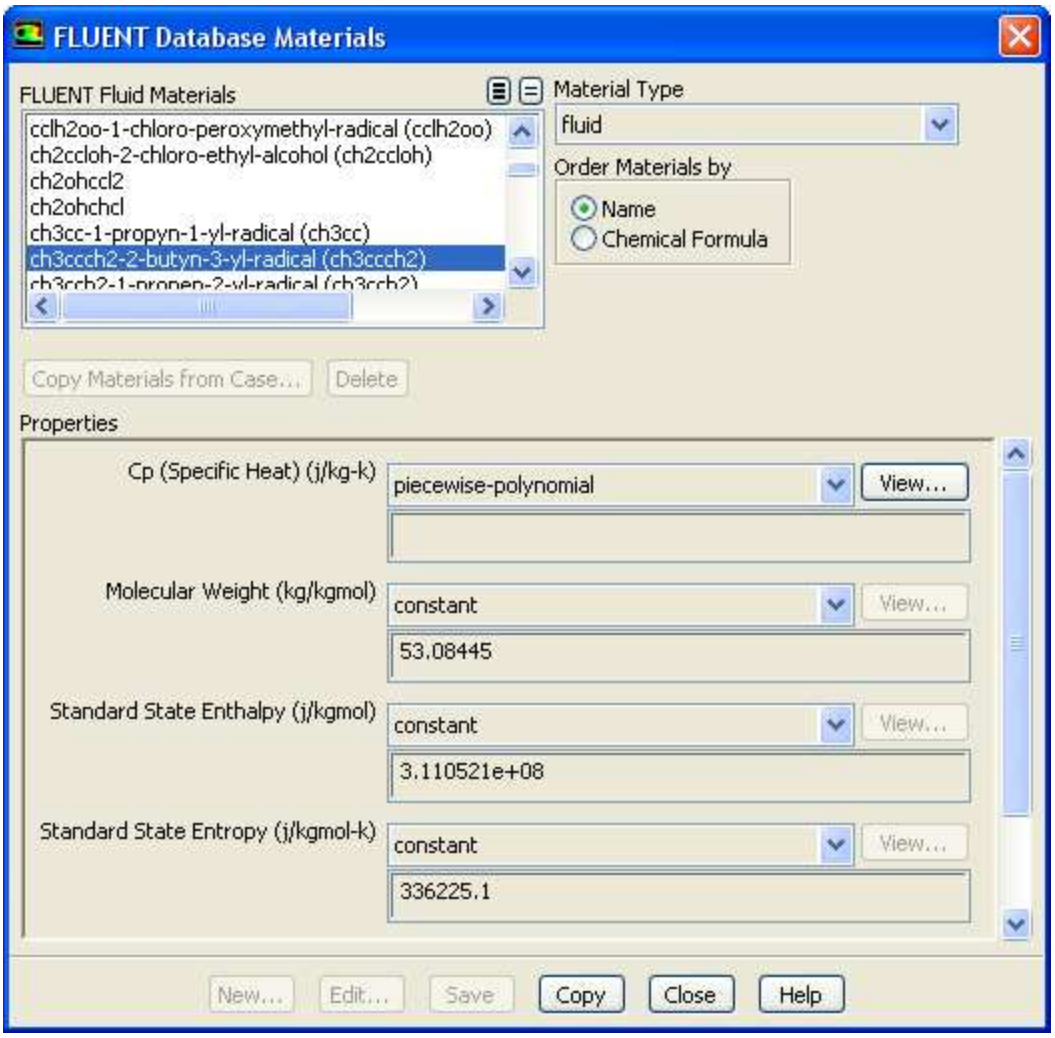
Delete
deletes the currently selected material from the local materials list. It has no effect on the global database.

35.4.2. FLUENT Database Materials Dialog Box

The **FLUENT Database Materials** dialog box is opened by clicking on the **FLUENT Database...** button in the *Create/Edit Materials Dialog Box* (p. 1736). In this dialog box you can view the global (site-wide) material properties database and copy materials list in the solver. See *Copying Materials from the ANSYS FLUENT Database* (p. 389) for details.

*There are two dialog boxes with the name **FLUENT Database Materials**. The other dialog box is opened from the Species Model Dialog Box (p. 1681).*

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

FLUENT Fluid Materials

contains a list of all materials of the selected **Material Type** that are defined in the database. The name of this list will change depending on the selected material type (e.g., **fluid**, **solid**, etc.). You can select one or more of these materials to be copied to the solver.

Material Type

is a drop-down list containing all of the available material types. By default, **fluid** and **solid** will be the only choices. If you are modeling species transport/combustion, **mixture** will also be available. For problems in which you have defined discrete-phase injections, **inert-particle**, **droplet-particle**, and/or **combusting-particle** will also appear.

Order Materials by

allows you to order the materials in the **Materials** list alphabetically by **Name** or alphabetically by **Chemical Formula**.

Copy Materials from Case...

opens the *Copy Case Material Dialog Box* (p. 1748).

Delete

deletes the selected materials from the database.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Properties

contains fields for the material properties that are defined for the selected material. These fields are for informational purposes only; they cannot be edited.

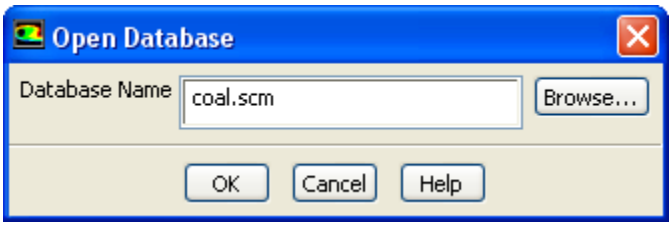
When you are viewing the database, not all properties displayed are relevant to your ANSYS FLUENT solution. After you copy the material, only properties with relevance to the current physical models will be displayed.

Copy

copies the current material from the global database to the local materials list in the solver.

35.4.3. Open Database Dialog Box

The **Open Database** dialog box is opened by clicking on the **User-Defined Database** button in the *Create/Edit Materials Dialog Box* (p. 1736).



Controls

Browse...

opens the *The **Select File** Dialog Box* (p. 33) where you can select the user-defined database to be used in the current solver session.

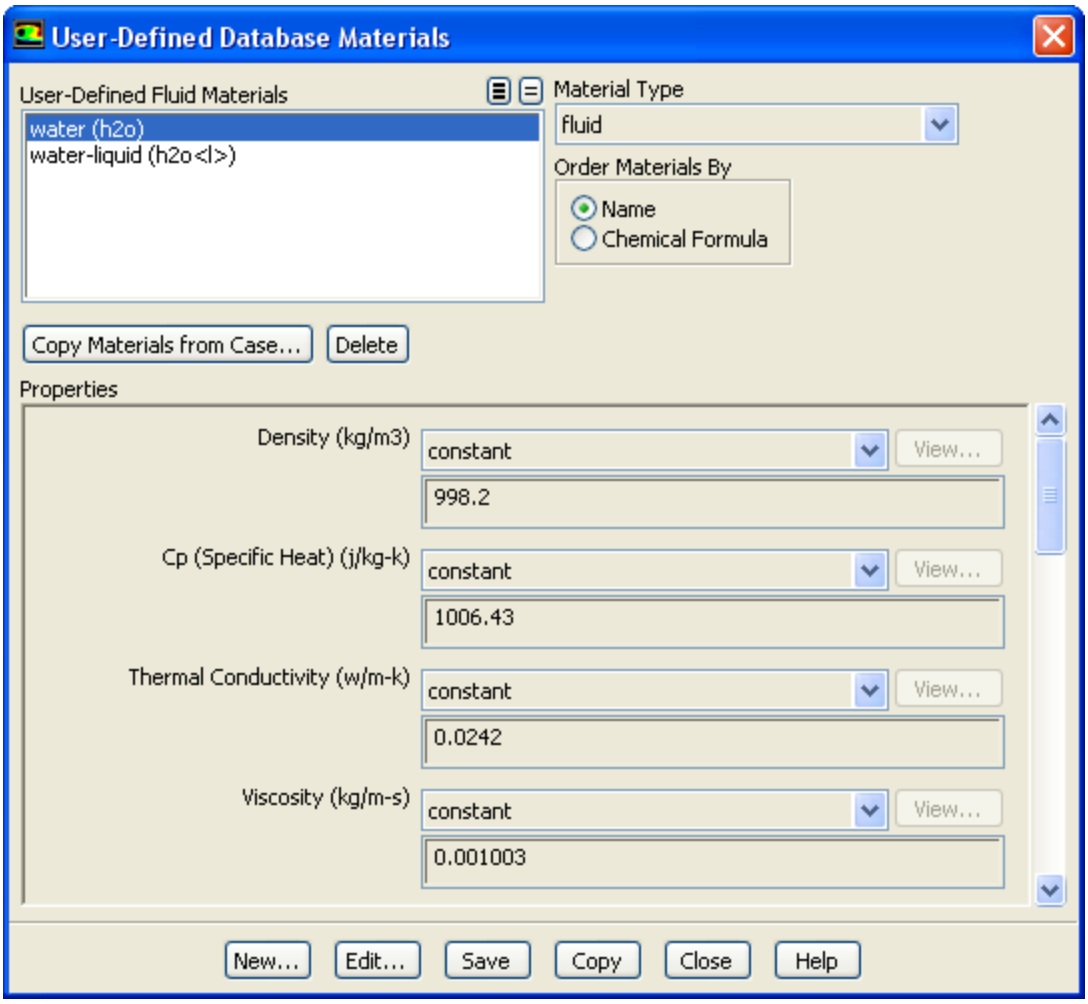
Database Name

allows to enter the path and name of a new database. If you select an existing database, this filed displays the path and name of the selected database.

35.4.4. User-Defined Database Materials Dialog Box

The **User-Defined Database Materials** dialog box is opened by clicking **OK** in the *Open Database Dialog Box* (p. 1746). In this dialog box you can view the user-defined material properties database and copy materials list in the solver. See *Viewing Materials in a User-Defined Database* (p. 392) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

User-Defined Materials

contains a list of all materials of the selected **Material Type** that are defined in the database. The name of this list will change depending on the selected material type (e.g., **User-Defined Fluid Materials**, **User-Defined Solid Materials**, etc.). You can select one or more of these materials to copy to your local list or edit their properties.

Material Type

is a drop-down list containing all of the available material types.

Order Materials By

allows you to order the materials in the **User-Defined Materials** list alphabetically by **Name** or alphabetically by **Chemical Formula**.

Copy Materials from Case...

opens the *Copy Case Material Dialog Box* (p. 1748).

Delete

deletes the selected materials from the database.

Properties

lists the properties and values of the selected material.

New...

opens a blank *Material Properties Dialog Box* (p. 1748) where you can define a new material.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

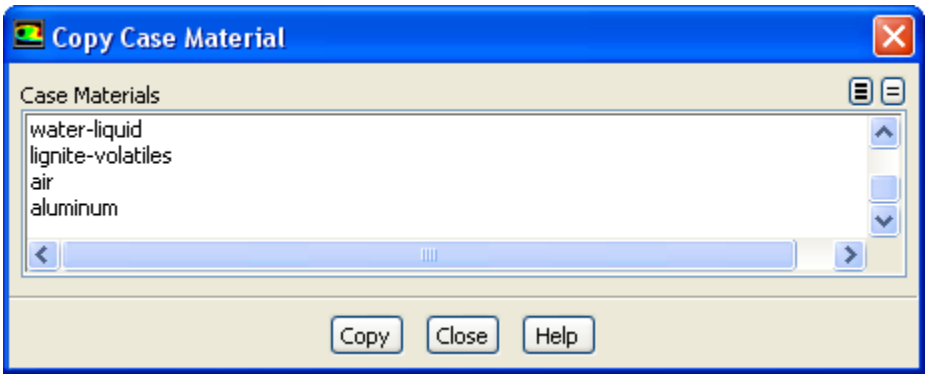
Edit...
opens the *Material Properties Dialog Box* (p. 1748) displaying the properties of the selected material.

Save
saves the information to the selected database.

Copy
copies the selected material to your local material list. If the material already exists the *New Material Name Dialog Box* (p. 1750) opens

35.4.5. Copy Case Material Dialog Box

This dialog box is opened by clicking the **Copy Materials from Case...** button in the *User-Defined Database Materials Dialog Box* (p. 1746).



Controls

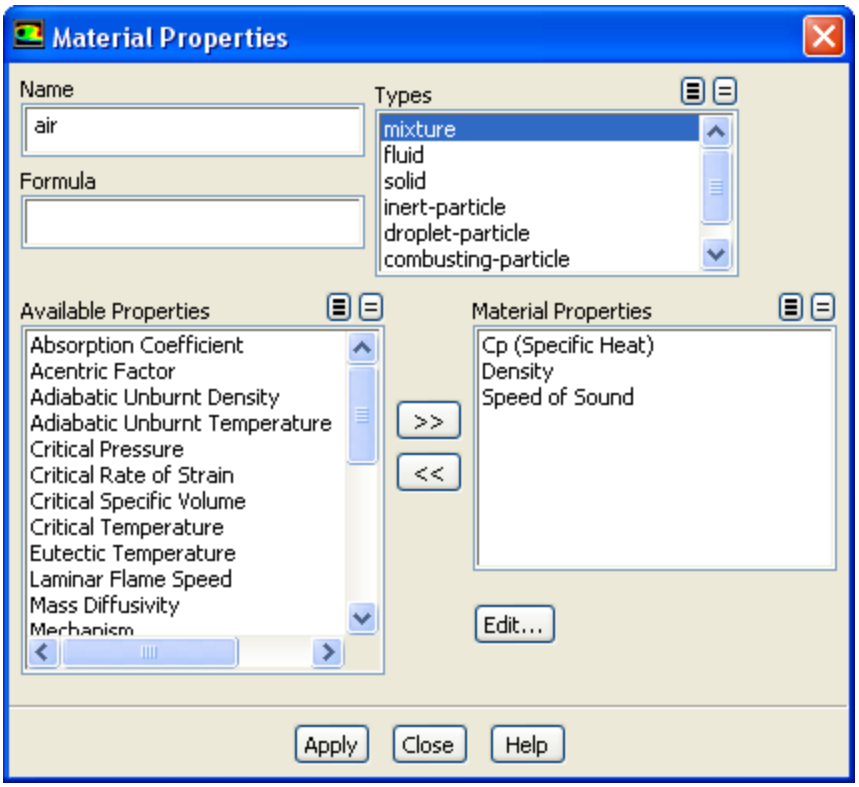
Case Materials
lists all the materials present in your local materials list.

Copy
copies the selected materials to the user-defined database.

35.4.6. Material Properties Dialog Box

This dialog box is opened by clicking **New...** button in the *User-Defined Database Materials Dialog Box* (p. 1746). See *Creating a New Materials Database and Materials* (p. 395) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name
specifies the name of the material that you are creating.

Formula
(optional) specifies the chemical formula of the material that you are creating.

Types
allows you to select material type from fluid, solid, inter-particle, droplet-particle, combusting-particle, and mixture materials.

Available Properties
lists properties applicable to the selected material type.

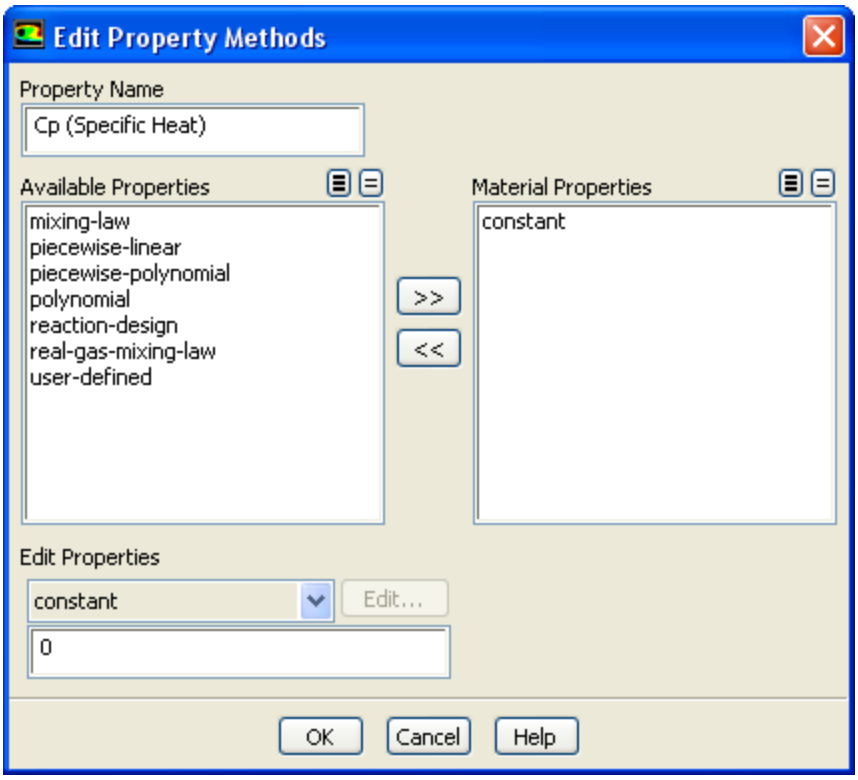
Material Properties
lists properties that you have selected from **Available Properties** list.

Edit...
opens *Edit Property Methods Dialog Box* (p. 1749) where you can edit the parameters that define a property.

35.4.7. Edit Property Methods Dialog Box

This dialog box is opened by clicking **Edit...** button in the *Material Properties Dialog Box* (p. 1748). See *Creating a New Materials Database and Materials* (p. 395) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Property Name
specifies the name of the property that you want to edit.

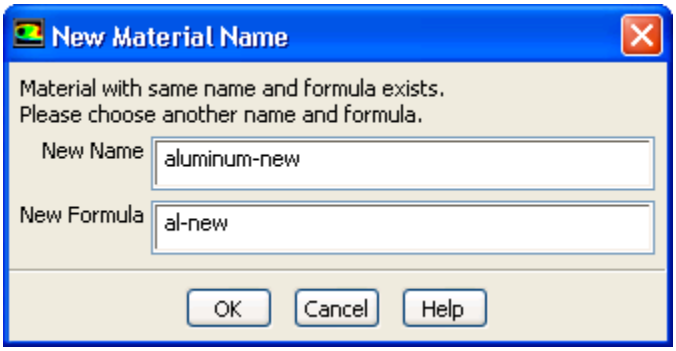
Available Properties
specifies the methods that can be used to define the selected property.

Material Properties
lists properties that you have selected from **Available Properties** list.

Edit Properties
allows you to select the property that you want to edit.

35.4.8. New Material Name Dialog Box

This dialog box is opened by clicking the **Copy** button in the *User-Defined Database Materials Dialog Box* (p. 1746) when a material is already defined with the same name in the *Create/Edit Materials Dialog Box* (p. 1736).



Controls

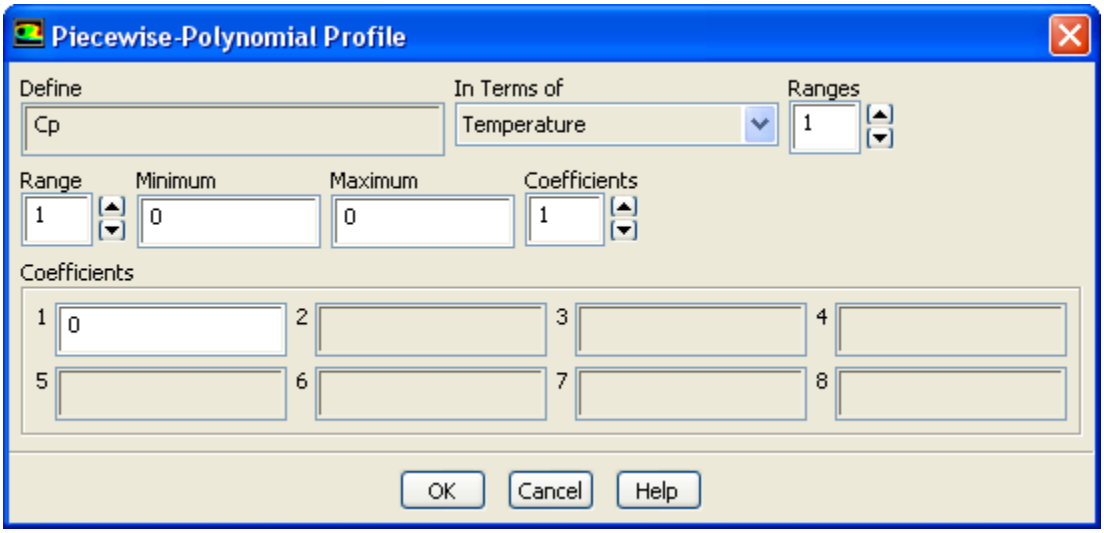
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

New Name
allows you to enter the new name for the material you need to copy.

New Formula
allows you to enter the new formula for the material you need to copy.

35.4.9. Polynomial Profile Dialog Box

The **Polynomial Profile** dialog box allows you to define a physical property as a polynomial function of temperature. This dialog box will open when you select **polynomial** in the drop-down list next to a physical property in the *Create/Edit Materials Dialog Box* (p. 1736). See *Inputs for Polynomial Functions* (p. 399) for details about the items below.



Controls

Define
shows the property that is being defined as a function of temperature.

In Terms of
shows the independent variable (**Temperature**). The property shown in **Define** will be defined as a polynomial function of temperature.

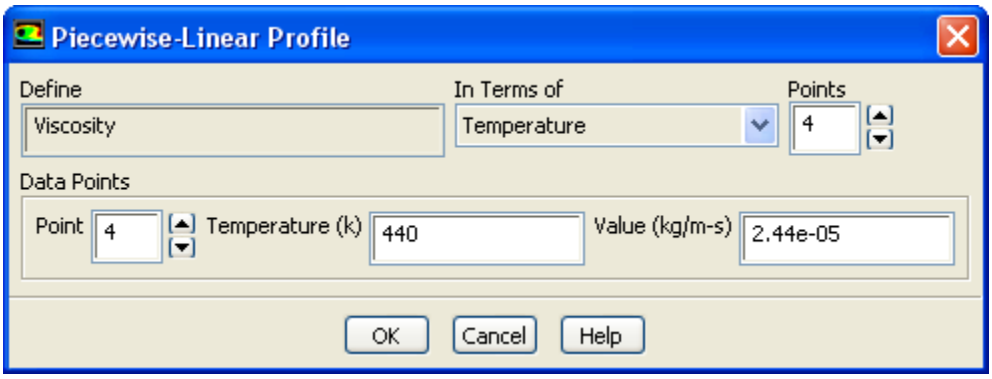
Coefficients
is an integer number entry that indicates the number of coefficients to be defined. You can define up to 8 coefficients.

Coefficients
contains real number entries for the number of coefficients set in the **Coefficients** integer number entry above. The number of entries that are editable will be the same as the number of coefficients you requested.

35.4.10. Piecewise-Linear Profile Dialog Box

The **Piecewise-Linear Profile** dialog box allows you to define a physical property as a piecewise-linear function of temperature. This dialog box will open when you select **piecewise-linear** in the drop-down list next to a physical property in the *Create/Edit Materials Dialog Box* (p. 1736). See *Inputs for Piecewise-Linear Functions* (p. 400) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Define
shows the property that is being defined as a function of temperature.

In Terms of
shows the independent variable (**Temperature**). The property shown in **Define** will be defined as a piecewise-linear function of temperature.

Points
indicates the number of data pairs that will define the piecewise distribution. You can define up to 30 pairs.

Data Points
contains entries for defining the data pairs.

Point
indicates the point for which the data pair (**Temperature**, **Value**) is being defined.

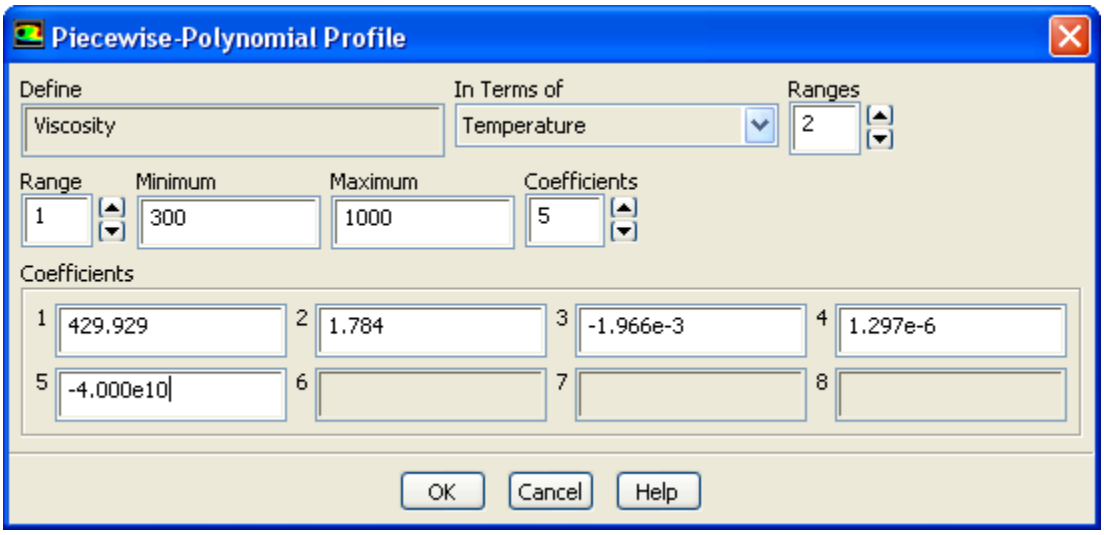
Temperature
is the independent variable.

Value
is the dependent variable (i.e., the property). In the example dialog box above, **Viscosity** is the variable being defined, as shown in the **Define** field.

35.4.11. Piecewise-Polynomial Profile Dialog Box

The **Piecewise-Polynomial Profile** dialog box allows you to define a physical property as a piecewise-polynomial function of temperature. This dialog box will open when you select **piecewise-polynomial** in the drop-down list next to a physical property in the *Create/Edit Materials Dialog Box* (p. 1736). See *Inputs for Piecewise-Polynomial Functions* (p. 401) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Define
shows the property that is being defined as a function of temperature.

In Terms of
shows the independent variable (**Temperature**). The property shown in **Define** will be defined as a polynomial function of temperature.

Ranges
sets the number of temperature ranges for which you will define polynomial functions. You can define up to 3 ranges.

Range
indicates the temperature range for which you are defining the polynomial function.

Minimum, Maximum
set the minimum and maximum temperatures for the specified **Range**.

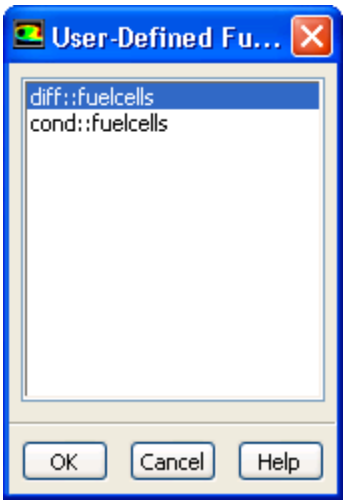
Coefficients
is an integer number entry that indicates the number of coefficients to be defined for the specified **Range**. You can define up to 8 coefficients.

Coefficients
contains real number entries for the number of coefficients set in the **Coefficients** integer number entry above. The number of entries that are editable will be the same as the number of coefficients you requested for the specified **Range**.

35.4.12. User-Defined Functions Dialog Box

The **User-Defined Functions** dialog box allows you to choose which user-defined function is to be used to define a material property. This dialog box will open when you select **user-defined** in the drop-down list next to one of the **Properties** in the *Create/Edit Materials Dialog Box* (p. 1736). See the separate UDF Manual for details about user-defined functions.

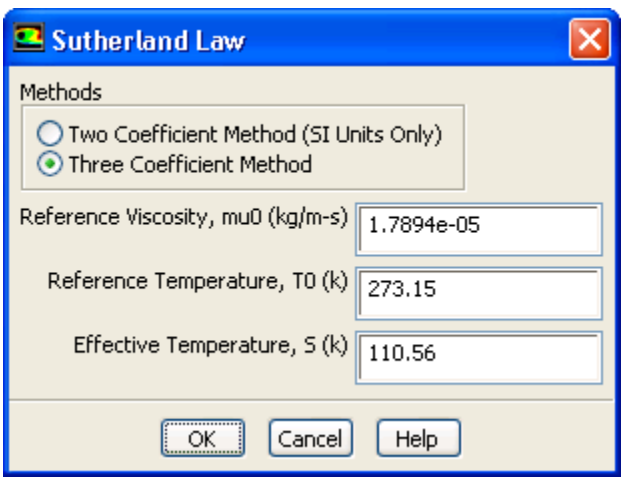
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



The list will contain all available user-defined functions.

35.4.13. Sutherland Law Dialog Box

The **Sutherland Law** dialog box allows you to set the coefficients for Sutherland's law for viscosity. This dialog box will open when you select **sutherland** in the drop-down list next to **Viscosity** in the *Create/Edit Materials Dialog Box* (p. 1736). See *Sutherland Viscosity Law* (p. 410) for details about the items below.



Controls

Methods

contains options for selecting the **Two Coefficient Method** or the **Three Coefficient Method**.

C1, C2

set the coefficients C_1 and C_2 in *Equation 8–17* (p. 410) in SI units. These inputs will appear if you select the **Two Coefficient Method**.

Reference Viscosity

sets the reference viscosity μ_0 in *Equation 8–18* (p. 410). This input will appear if you select the **Three Coefficient Method**.

Reference Temperature

sets the reference temperature T_0 in *Equation 8–18* (p. 410). This input will appear if you select the **Three Coefficient Method**.

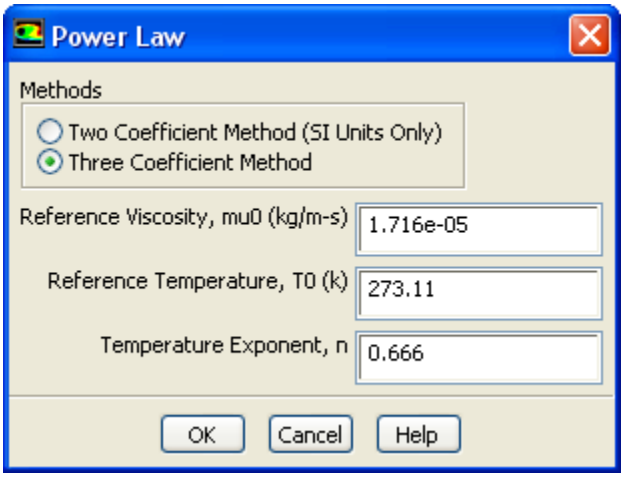
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Effective Temperature

sets the effective temperature S in *Equation 8–18* (p. 410). This input will appear if you select the **Three Coefficient Method**.

35.4.14. Power Law Dialog Box

The **Power Law** dialog box allows you to set the coefficients for the power law for viscosity. This dialog box will open when you select **power-law** in the drop-down list next to **Viscosity** in the *Create/Edit Materials Dialog Box* (p. 1736). See *Power-Law Viscosity Law* (p. 411) for details about the items below.



Controls

Methods

contains options for selecting the **Two Coefficient Method** or the **Three Coefficient Method**.

B

sets the coefficient B in *Equation 8–19* (p. 411) in SI units. This input will appear if you select the **Two Coefficient Method**.

Reference Viscosity

sets the reference viscosity μ_0 in *Equation 8–20* (p. 411). This input will appear if you select the **Three Coefficient Method**.

Reference Temperature

sets the reference temperature T_0 in *Equation 8–20* (p. 411). This input will appear if you select the **Three Coefficient Method**.

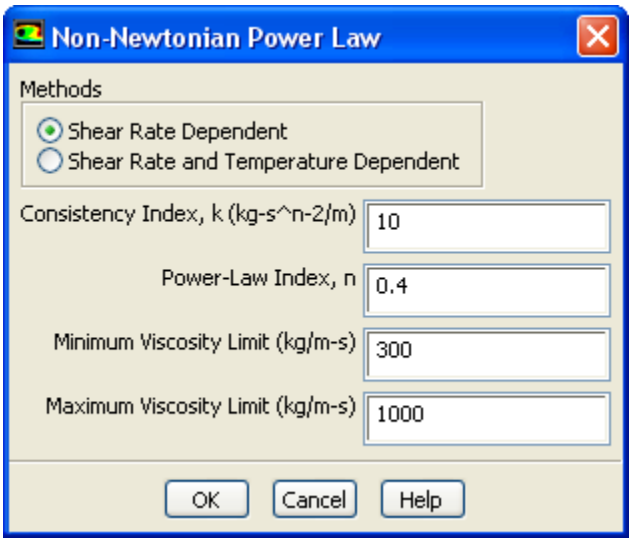
Temperature Exponent

sets the temperature exponent n in *Equation 8–19* (p. 411) or *Equation 8–20* (p. 411), depending on your **Method** selection. If you are using the **Two Coefficient Method**, this input must be in SI units.

35.4.15. Non-Newtonian Power Law Dialog Box

The **Non-Newtonian Power Law** dialog box allows you to set the parameters for the non-Newtonian power law for viscosity. This dialog box will open when you select **non-newtonian-power-law** in the drop-down list next to **Viscosity** in the *Create/Edit Materials Dialog Box* (p. 1736). See *Power Law for Non-Newtonian Viscosity* (p. 415) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Methods
allows you to select the type of dependency on the viscosity.

Shear Rate Dependent
is where the viscosity is dependent on the shear rate.

Shear Rate and Temperature Dependent
is where the viscosity is dependent on the shear rate and the temperature.

Consistency Index
sets the consistency index k in *Equation 8–32* (p. 415).

Power-Law Index
sets the power-law index n in *Equation 8–32* (p. 415).

Minimum Viscosity Limit, Maximum Viscosity Limit
set the minimum and maximum viscosity limits.

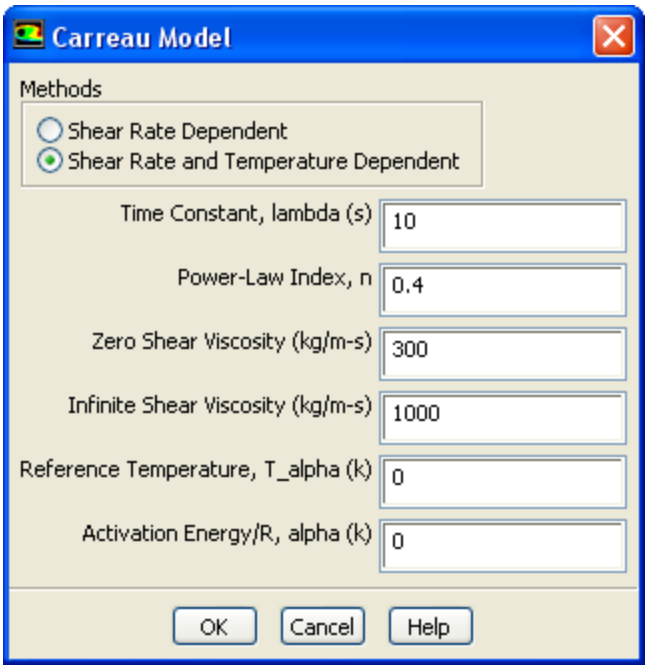
Reference Temperature
sets the reference temperature.

Activation Energy/R, alpha
is the ratio of the activation energy to the thermodynamic constant α in *Equation 8–31* (p. 414).

35.4.16. Carreau Model Dialog Box

The **Carreau Model** dialog box allows you to set the parameters for the non-Newtonian Carreau model for viscosity. This dialog box will open when you select **carreau** in the drop-down list next to **Viscosity** in the *Create/Edit Materials Dialog Box* (p. 1736). See *The Carreau Model for Pseudo-Plastics* (p. 415) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Methods

allows you to select the type of dependency on the viscosity.

Shear Rate Dependent

is where the viscosity is dependent on the shear rate.

Shear Rate and Temperature Dependent

is where the viscosity is dependent on the shear rate and the temperature.

Time Constant, lambda

sets the time constant λ in *Equation 8–33* (p. 415).

Power-Law Index

sets the power-law index n in *Equation 8–33* (p. 415).

Zero Shear Viscosity, Infinite Shear Viscosity

set the zero and infinite shear viscosity limits η_0 and η_∞ in *Equation 8–33* (p. 415).

Reference Temperature, T_alpha

sets the reference temperature T_0 in *Equation 8–33* (p. 415).

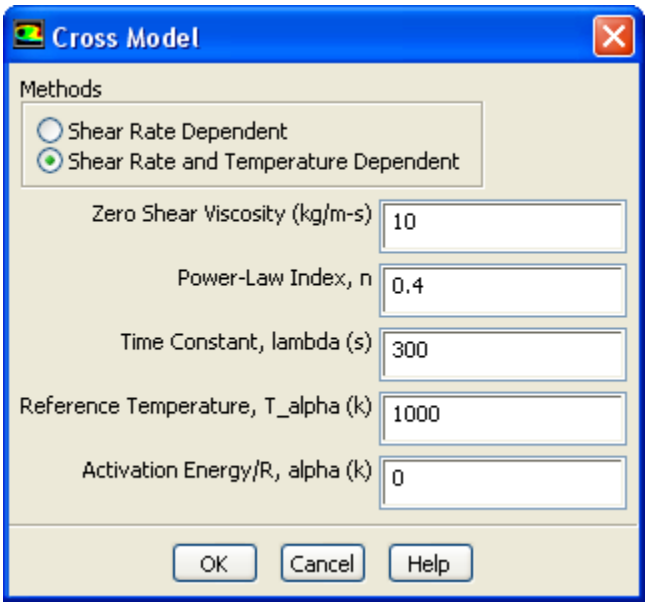
Activation Energy/R, alpha

is the ratio of the activation energy to the thermodynamic constant α in *Equation 8–31* (p. 414).

35.4.17. Cross Model Dialog Box

The **Cross Model** dialog box allows you to set the parameters for the non-Newtonian Cross model for viscosity. This dialog box will open when you select **cross** in the drop-down list next to **Viscosity** in the *Create/Edit Materials Dialog Box* (p. 1736). See *Cross Model* (p. 416) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Methods
allows you to select the type of dependency on the viscosity.

Shear Rate Dependent
is where the viscosity is dependent on the shear rate.

Shear Rate and Temperature Dependent
is where the viscosity is dependent on the shear rate and the temperature.

Zero Shear Viscosity
sets the zero shear viscosity limit η_0 in *Equation 8–34* (p. 416).

Power-Law Index
sets the power-law index n in *Equation 8–34* (p. 416).

Time Constant
sets the time constant λ in *Equation 8–34* (p. 416).

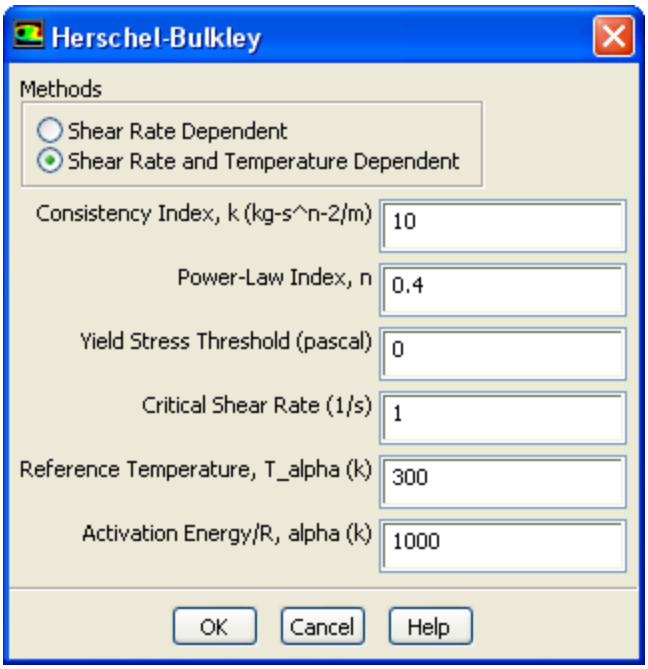
Reference Temperature, T_alpha
sets the reference temperature T_0 in *Equation 8–33* (p. 415).

Activation Energy/R, alpha
is the ratio of the activation energy to the thermodynamic constant α in *Equation 8–31* (p. 414).

35.4.18. Herschel-Bulkley Dialog Box

The **Herschel-Bulkley** dialog box allows you to set the parameters for the non-Newtonian Herschel-Bulkley model for viscosity. This dialog box will open when you select **herschel-bulkley** in the drop-down list next to **Viscosity** in the *Create/Edit Materials Dialog Box* (p. 1736). See *Herschel-Bulkley Model for Bingham Plastics* (p. 417) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Methods

allows you to select the type of dependency on the viscosity.

Shear Rate Dependent

is where the viscosity is dependent on the shear rate.

Shear Rate and Temperature Dependent

is where the viscosity is dependent on the shear rate and the temperature.

Consistency Index

sets the consistency index k in *Equation 8–36* (p. 417).

Power-Law Index

sets the power-law index n in *Equation 8–36* (p. 417).

Yield Stress Threshold

sets the yield stress threshold τ_0 in *Equation 8–36* (p. 417).

Critical Shear Rate

set the critical shear rate $\dot{\gamma}_c$ in *Equation 8–36* (p. 417).

Reference Temperature, T_alpha

sets the reference temperature T_0 in *Equation 8–33* (p. 415).

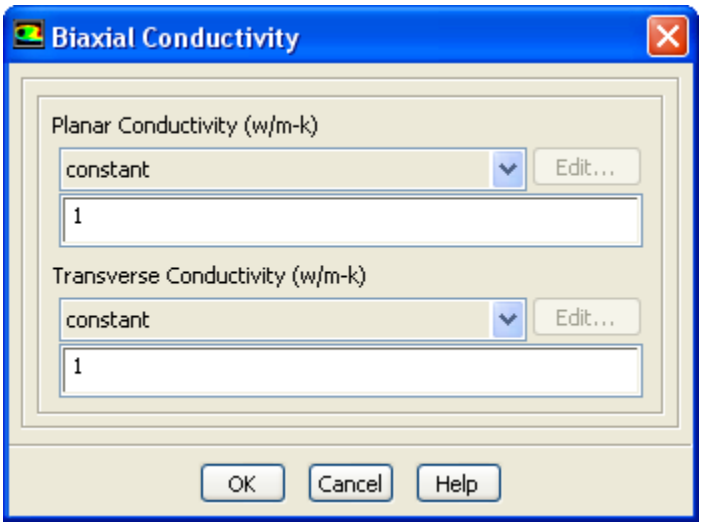
Activation Energy/R, alpha

is the ratio of the activation energy to the thermodynamic constant α in *Equation 8–31* (p. 414).

35.4.19. Biaxial Conductivity Dialog Box

The **Biaxial Conductivity** dialog box allows you to define a biaxial orthotropic thermal conductivity, which is mainly applicable to solid materials used for the wall shell conduction model. This dialog box will open when you select **biaxial** in the drop-down list next to **Thermal Conductivity** in the *Create/Edit Materials Dialog Box* (p. 1736). See *Biaxial Thermal Conductivity* (p. 423) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

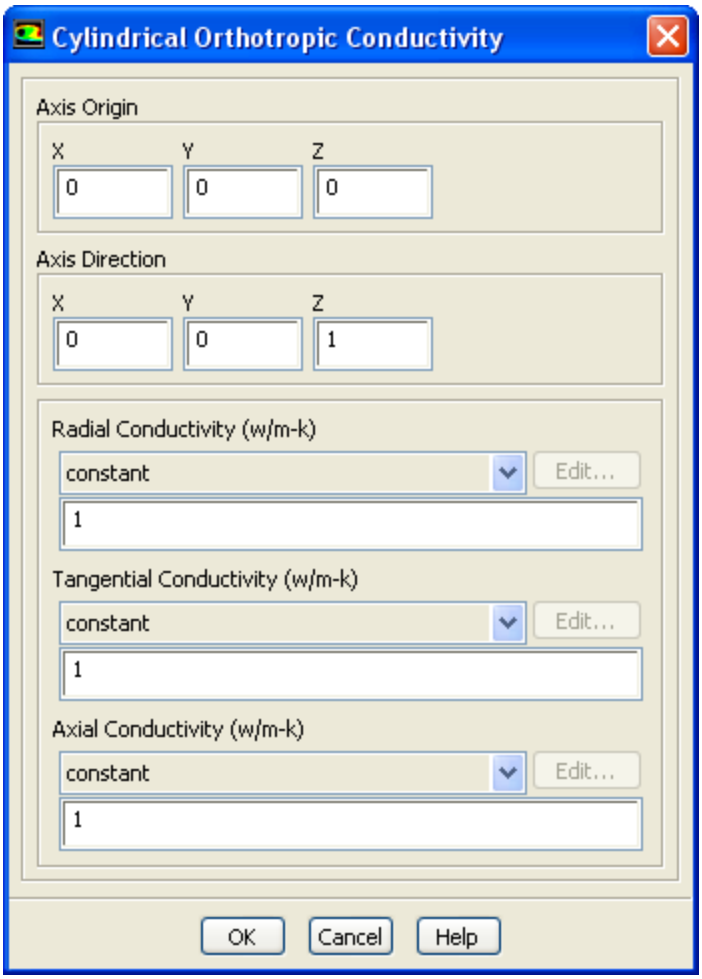
Planar Conductivity
specifies the conductivity within the shell (or solid) region.

Transverse Conductivity
specifies the conductivity normal to the surface of the solid region.

35.4.20. Cylindrical Orthotropic Conductivity Dialog Box

The **Cylindrical Orthotropic Conductivity** dialog box allows you to define an orthotropic thermal conductivity in cylindrical coordinates. This dialog box will open when you select **cyl-orthotropic** in the drop-down list next to **Thermal Conductivity** in the *Create/Edit Materials Dialog Box* (p. 1736). See *Cylindrical Orthotropic Thermal Conductivity* (p. 426) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Axis Origin

allows you to specify the origin of the cylindrical coordinate system.

X, Y

specify the X, Y and Z (for three dimensional system) coordinates.

Axis Direction

(3D only) allows you to specify the direction of the axis.

X, Y

specify 1 against the direction of the axis.

Radial Conductivity

specifies the conductivity in the radial direction.

Tangential Conductivity

specifies the conductivity in the tangential direction.

Axial Conductivity

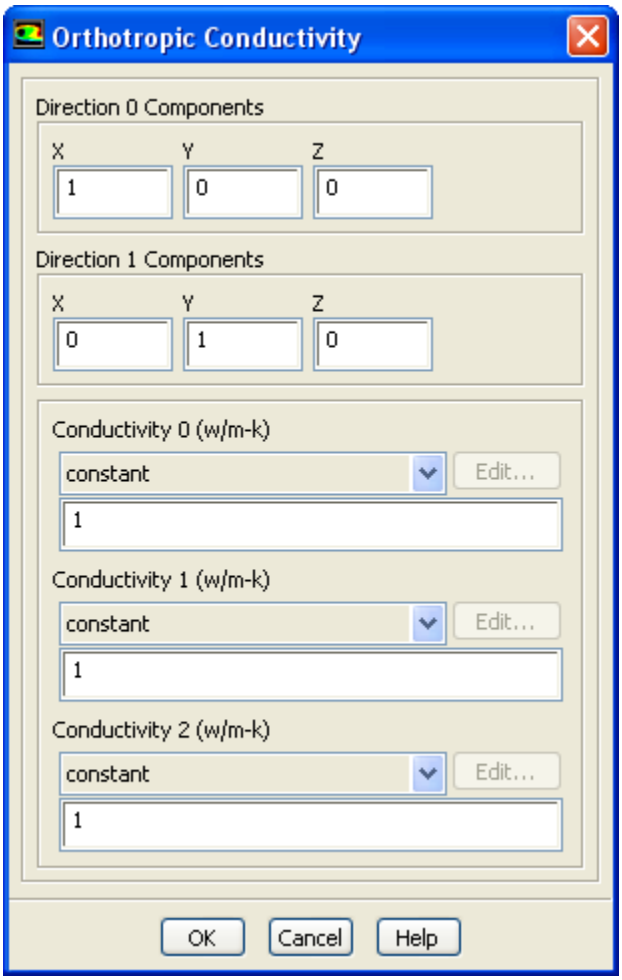
(3D only) specifies the conductivity in the axial direction.

35.4.21. Orthotropic Conductivity Dialog Box

The **Orthotropic Conductivity** dialog box allows you to define an orthotropic thermal conductivity for a solid material. This dialog box will open when you select **orthotropic** in the drop-down list next to **Thermal**

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Conductivity in the *Create/Edit Materials Dialog Box* (p. 1736). See *Orthotropic Thermal Conductivity* (p. 424) for details about the items below.



Controls

Direction 0 Components, Direction 1 Components

specify the directions $\hat{e}_\xi$ and $\hat{e}_\eta$ in *Equation 8–47* (p. 424) as **X,Y,Z** vectors. For 2D cases, only **Direction 0 Components** will appear.

Conductivity 0, Conductivity 1, Conductivity 2

specify (k_ξ), (k_η), and (k_ζ) in *Equation 8–47* (p. 424) as **constant**, **polynomial**, **piecewise-linear**, or **piecewise-polynomial** functions of temperature. For 2D cases, only **Conductivity 0** and **Conductivity 1** will appear.

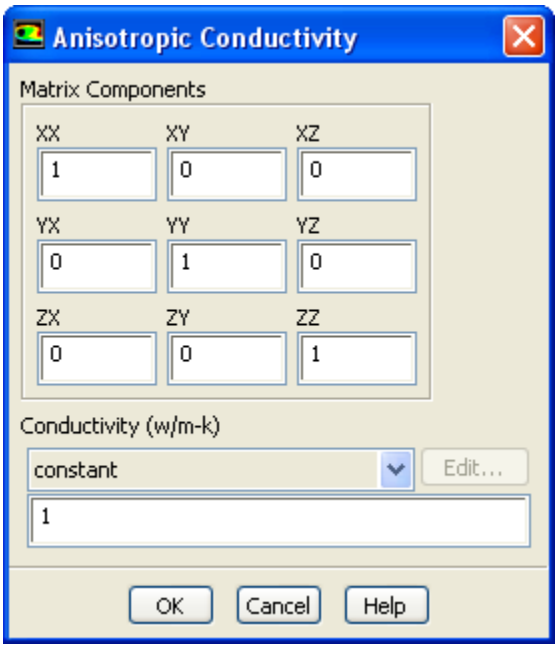
Edit...

opens the appropriate dialog box for input of a temperature-dependent conductivity. (This button will be unavailable if you specify a **constant** conductivity.)

35.4.22. Anisotropic Conductivity Dialog Box

The **Anisotropic Conductivity** dialog box allows you to define a general anisotropic thermal conductivity. This dialog box will open when you select **anisotropic** in the drop-down list next to **Thermal Conductivity** in the *Create/Edit Materials Dialog Box* (p. 1736). See *Anisotropic Thermal Conductivity* (p. 422) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Matrix Components

specify the components of the matrix $\hat{e}_{ij}$ in *Equation 8–46* (p. 422).

Conductivity

specifies the value of k in *Equation 8–46* (p. 422) as a **constant**, or as a **polynomial**, **piecewise-linear**, or **piecewise-polynomial** function of temperature.

Edit...

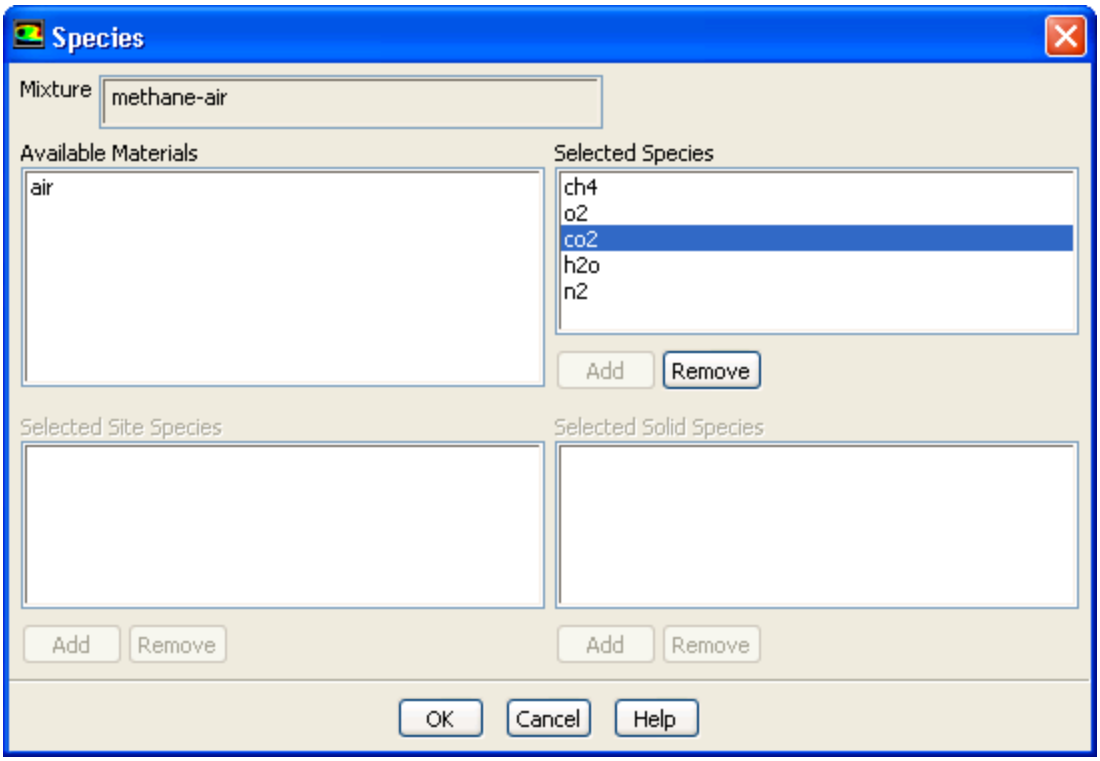
opens the appropriate dialog box for input of a temperature-dependent conductivity. (This button will be unavailable if you specify a **constant** conductivity.)

35.4.23. Species Dialog Box

The **Species** dialog box (opened by clicking on the **Edit...** button next to **Mixture Species** in the *Create/Edit Materials Dialog Box* (p. 1736))) allows you to define the species that comprise a mixture material. See *Defining the Species in the Mixture* (p. 806) for details about the items below.

(Note that the **Species** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Mixture

shows the name of the mixture material for which you are defining the species. This field is not editable.

Available Materials

is a list of all of the materials to be a component in the mixture material by selecting it and clicking on the **Add** button below the **Selected Species** or **Selected Surface Species** list. To add a material to the **Available Materials** list, use the *Fluent Database Materials Dialog Box* (p. 1783) to copy the fluid material to local storage.

Selected Species

is a list of all the fluid-phase species in the mixture. To add a material to the list, select it in the **Available Materials** list and click on the **Add** button below the **Selected Species** list. To remove a material, select it in the **Selected Species** list and click on **Remove**. See *Overview of the Species Dialog Box* (p. 807) for more information.

Selected Solid Species

is a list of all the solid species in the mixture. To add a material to the list, select it in the **Available Materials** list and click on the **Add** button below the **Selected Solid Species** list. To remove a material, select it in the **Selected Solid Species** list and click on **Remove**. See *Overview of the Species Dialog Box* (p. 807) for more information.

Selected Site Species

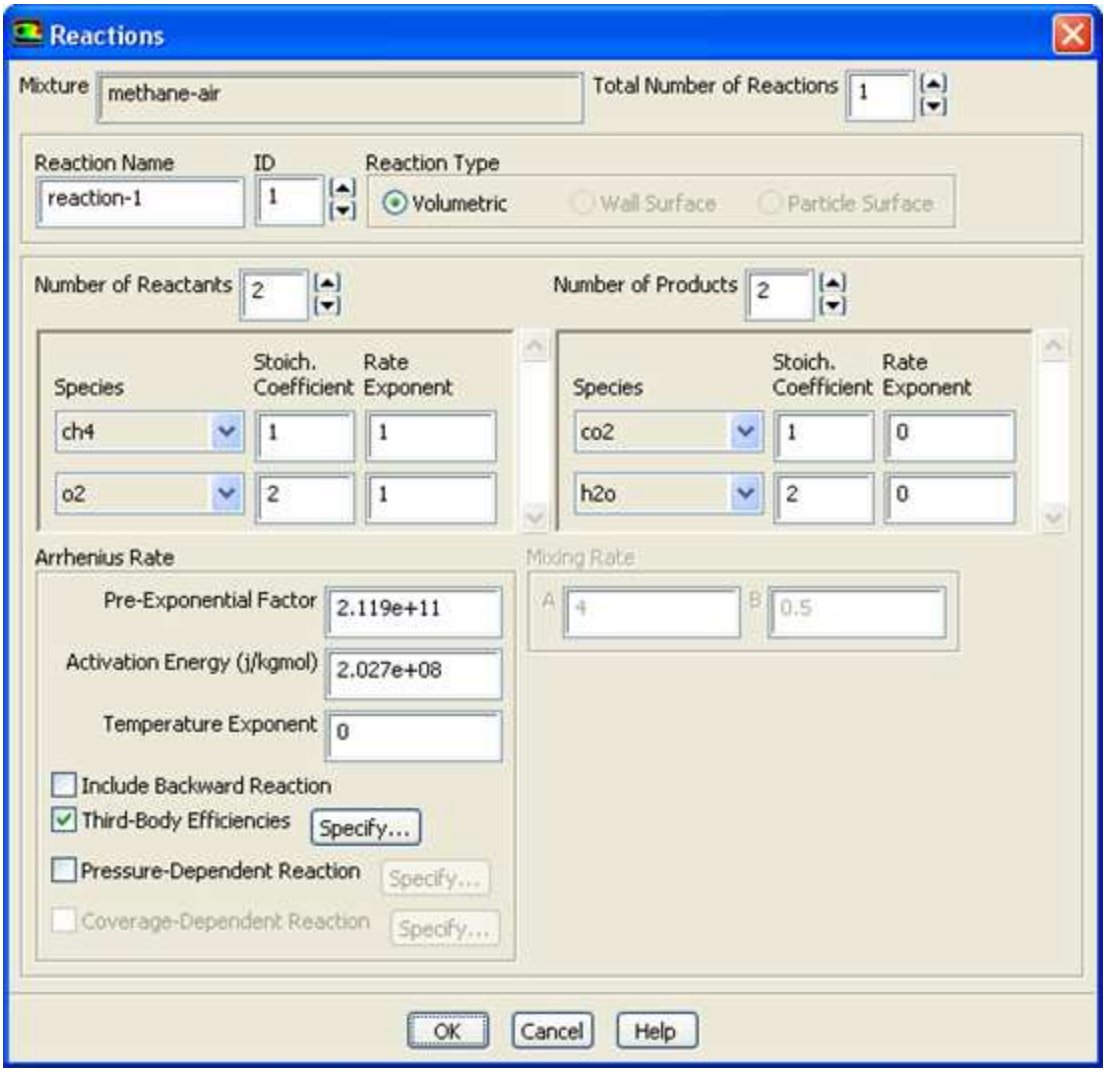
is a list of all the site species in the mixture. To add a material to the list, select it in the **Available Materials** list and click on the **Add** button below the **Selected Site Species** list. To remove a material, select it in the **Selected Site Species** list and click on **Remove**. See *Overview of the Species Dialog Box* (p. 807) for more information.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.4.24. Reactions Dialog Box

The **Reactions** dialog box (opened by clicking on the **Edit...** button next to **Reaction** in the *Create/Edit Materials Dialog Box* (p. 1736)) allows you to define the reactions that comprise a mixture material. See *Defining Reactions* (p. 809) for details about using this dialog box.

(Note that the **Reactions** dialog box is a modal dialog, which means that you must tend to it immediately before continuing the property definitions.)



Controls

Mixture

shows the name of the mixture material for which you are defining the species. This field is not editable.

Total Number of Reactions

sets the total number of reactions (fluid-phase reactions and surface reactions occurring at wall boundaries). Use the arrows to change the value, or type in the value and press RETURN.

Reaction Name

contains the name of the reaction.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ID

sets the number of the reaction you want to define. (Again, if you type in the value be sure to press RETURN.)

Reaction Type

contains options that allow you to specify the type of reaction.

Volumetric

specifies, if enabled, that the current reaction is a volumetric reaction.

Wall Surface

specifies, if enabled, that the current reaction is a wall surface reaction.

Particle Surface

specifies, if enabled, that the current reaction is a particle surface reaction.

Number of Reactants

indicates the number of reactants in the specified reaction.

Species

contains drop-down lists of all species in the mixture. (The number of lists will be equal to the **Number of Reactants**.) Select each reactant in one of these lists.

Stoich. Coefficient

specifies the stoichiometric coefficient of the reactant species in the reaction.

Rate Exponent

specifies the rate constant for the reactant species in the reaction.

Number of Products

indicates the number of products in the specified reaction.

Species

contains drop-down lists of all species in the mixture. (The number of lists will be equal to the **Number of Products**.) Select each product in one of these lists.

Stoich. Coefficient

specifies the stoichiometric coefficient of the product species in the reaction.

Rate Exponent

specifies the rate constant for the product species in the reaction.

Arrhenius Rate

contains inputs related to the Arrhenius rate. (If you have chosen **Eddy-Dissipation** for the **Turbulence-Chemistry Interaction** in the *Species Model Dialog Box* (p. 1681), these inputs are not required.)

Pre-exponential Factor

is the constant A_r in Equation 7–10 in the Theory Guide. The units of A_r depend on the other rate constant inputs, but must be defined such that the units of the reaction rate $R_{i,r}$ (Equation 7–5 in the Theory Guide) are in (kg/m^3-s) if you are using SI units.

Important

It is important to note that if you have selected the British units system, the Arrhenius factor should still be input in SI units. This is because ANSYS FLUENT applies no conversion factor to your input of A_r (the conversion factor is 1.0) when you work in British units, as the correct conversion factor depends on your inputs for $v_{j,r}$, β_r, etc.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Activation Energy

is the constant E_r in the forward rate constant expression, Equation 7–10 in the Theory Guide).

Temperature Exponent

is the value for the constant β_r in Equation 7–10 in the Theory Guide.

Include Backward Reaction

specifies that the reaction is reversible. The backward reaction rate constant will be computed from Equation 7–10 in the Theory Guide.

Third-Body Efficiencies

enables the input and use of third-body efficiencies ($\gamma_{j,r}$ in Equation 7–9 in the Theory Guide). These inputs are optional. (This item is available only if you have selected **Volumetric** for the **Reaction Type**.)

Pressure-Dependent Reaction

enables the modeling of a pressure fall-off reaction. See *Inputs for Reaction Definition* (p. 809) **Laminar Finite-Rate** or **Eddy-Dissipation Concept** for the **Turbulence-Chemistry Interaction** in the *Species Model Dialog Box* (p. 1681) and have selected **Volumetric** for the **Reaction Type**.)

Coverage-Dependent Reaction

is used when modeling **Wall Surface** reactions with site-balancing and reaction rates depend on site coverages.

Specify...

opens the *Third-Body Efficiencies Dialog Box* (p. 1768), the *Pressure-Dependent Reaction Dialog Box* (p. 1768), or *Coverage-Dependent Reaction Dialog Box* (p. 1770) in which you can specify the third-body efficiencies, pressure-dependent reaction parameters, or coverage parameters.

Mixing Rate

contains inputs related to the mixing rate. (If you have chosen **Laminar Finite-Rate** or **Eddy-Dissipation Concept** for the **Turbulence-Chemistry Interaction** in the *Species Model Dialog Box* (p. 1681), these inputs are not required.)

A

is the constant A in the turbulent mixing rate (Equation 7–24 and Equation 7–25 in the Theory Guide) when it is applied to a species that appears as a reactant in this reaction. The default setting of 4.0 is based on the empirically derived values given by Magnussen et al. [*49*] (p. 2211).

B

is the constant B in the turbulent mixing rate (Equation 7–25 in the Theory Guide) when it is applied to a species that appears as a product in this reaction. The default setting of 0.5 is based on the empirically derived values given by Magnussen et al. [*49*] (p. 2211).

Particle Surface Reaction

contains inputs related to a particle surface reaction. See *User Inputs for Particle Surface Reactions* (p. 835) for details. (This section will appear only if you have selected **Particle Surface** for the **Reaction Type**.)

Diffusion Limited Species

is a drop-down list that allows you to select the species for which the concentration gradient between the bulk and the particle surface is the largest when there is more than one gaseous reactant taking part in the particle surface reaction. See *User Inputs for Particle Surface Reactions* (p. 835) for details.

Diffusion Rate Constant

is the constant $C_{1,r}$ in Equation 7–68 in the Theory Guide.

Effectiveness Factor

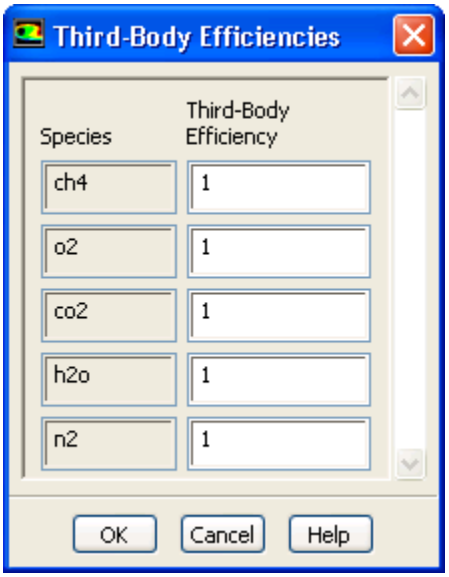
is the constant η_r in Equation 7–66 in the Theory Guide.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.4.25. Third-Body Efficiencies Dialog Box

The **Third-Body Efficiencies** dialog box (opened by clicking on **Specify...** next to the **Third-Body Efficiencies** button in the *Reactions Dialog Box* (p. 1765)) allows you to specify the third-body efficiencies for each species in the mixture, to be used in Equation 7–9 in the Theory Guide. See *Defining Reactions* (p. 809) for details.

(Note that the **Third-Body Efficiencies** dialog box is a model dialog boxl, which means that you must tend to it immediately before continuing the property definitions.)



Controls

Species
displays the name of each species in the mixture.

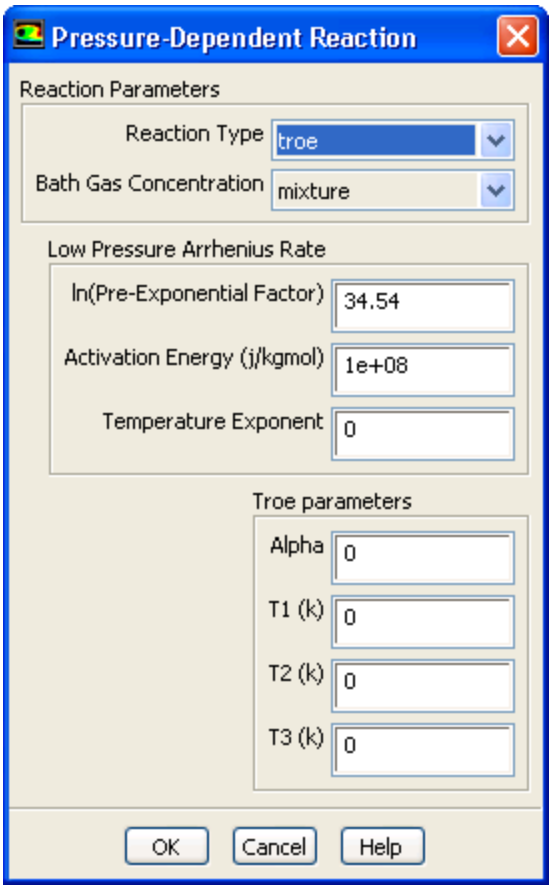
Third-body Efficiency
specifies the third-body efficiency for each species.

35.4.26. Pressure-Dependent Reaction Dialog Box

The **Pressure-Dependent Reaction** dialog box (opened by clicking on **Specify...** under **Pressure-Dependent Reaction** in the *Reactions Dialog Box* (p. 1765)) allows you to specify parameters for a pressure fall-off reaction. See *Inputs for Reaction Definition* (p. 809) for details.

(Note that the **Pressure-Dependent Reaction** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Reaction Parameters

contains inputs for specifying the type of pressure fall-off reaction and the reaction parameters. See Pressure-Dependent Reactions in the Theory Guide for details.

Reaction Type

contains a drop-down list of the available reaction types: **lindemann**, **troe**, and **sri**. See Pressure-Dependent Reactions in the Theory Guide for details.

Bath Gas Concentration

allows you to specify if the bath gas concentration ($[M]$ in Equation 7–18 in the Theory Guide) is to be defined as the concentration of the **mixture**, or as the concentration of one of the mixture's constituent species.

Low Pressure Arrhenius Rate

contains inputs for specifying low-pressure Arrhenius parameters.

ln(Pre-exponential Factor)

is the natural logarithm of the constant A_{low} in Equation 7–16 in the Theory Guide. The pre-exponential factor A_{low} is often an extremely large number, so you will input the natural logarithm of this term.

Activation Energy

is the constant E_{low} in Equation 7–16 in the Theory Guide.

Temperature Exponent

is the constant β_{low} in Equation 7–16 in the Theory Guide.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Troe parameters

contains inputs for specifying parameters for the Troe method. See Pressure-Dependent Reactions in the Theory Guide for details. (This section of the dialog box will appear only if you have selected **troe** as the **Reaction Type**.)

Alpha

is the constant α in Equation 7–21 in the Theory Guide.

T1

is the constant T_1 in Equation 7–21 in the Theory Guide.

T2

is the constant T_2 in Equation 7–21 in the Theory Guide.

T3

is the constant T_3 in Equation 7–21 in the Theory Guide.

SRI Parameters

contains inputs for specifying parameters for the SRI method. See Pressure-Dependent Reactions in the Theory Guide for details. (This section of the dialog box will appear only if you have selected **sri** as the **Reaction Type**.)

a

is the constant a in Equation 7–22 in the Theory Guide.

b

is the constant b in Equation 7–22 in the Theory Guide.

c

is the constant c in Equation 7–22 in the Theory Guide.

d

is the constant d in Equation 7–22 in the Theory Guide.

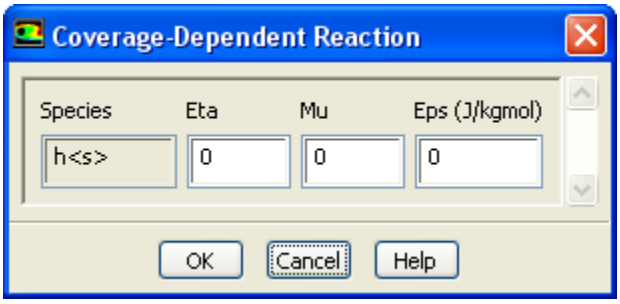
e

is the constant e in Equation 7–22 in the Theory Guide.

35.4.27. Coverage-Dependent Reaction Dialog Box

The **Coverage-Dependent Reaction** dialog box (opened by clicking on **Specify...** under **Coverage-Dependent Reaction** in the *Reactions Dialog Box* (p. 1765)) allows you to model **Wall Surface** reactions with site-balancing.

(Note that the **Coverage-Dependent Reaction** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Species
are the site species of the reaction.

Eta
is the surface coverage rate modification of the specie and is defined in Equation 7–45 in the Theory Guide.

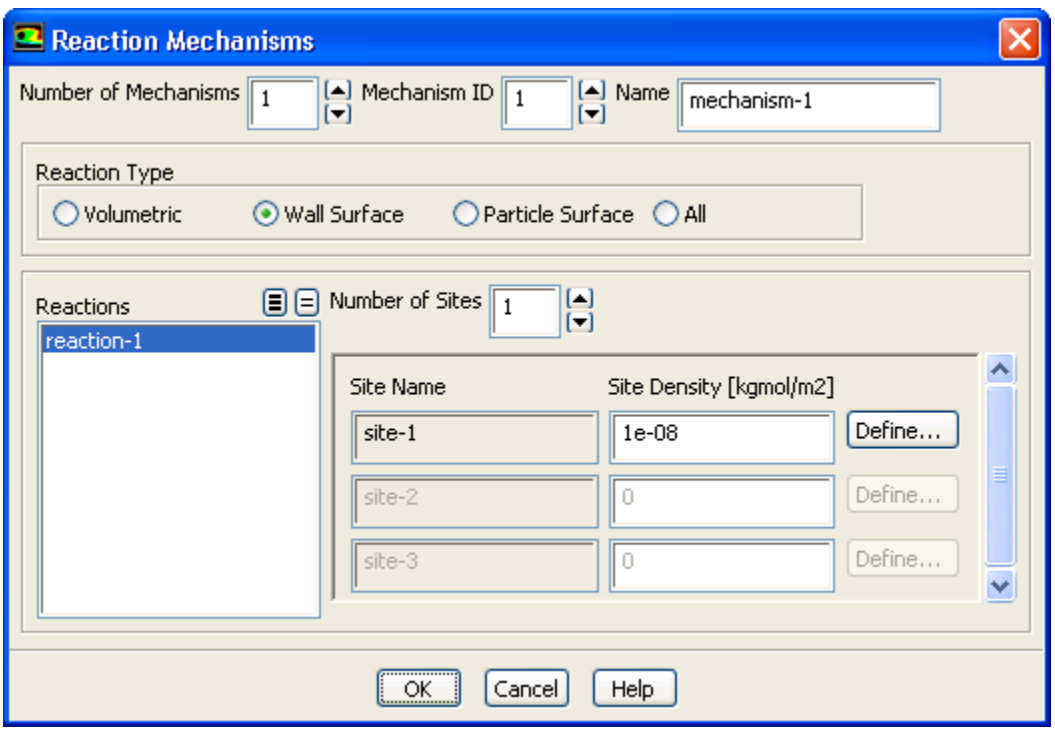
Mu
is the surface coverage rate modification of the specie and is defined in Equation 7–45 in the Theory Guide.

Eps
is the surface coverage rate modification of the specie and is defined in Equation 7–45 in the Theory Guide.

35.4.28. Reaction Mechanisms Dialog Box

The **Reaction Mechanisms** dialog box (opened by clicking on the **Edit...** button next to **Mechanism** in the *Create/Edit Materials Dialog Box* (p. 1736)) allows you to select the reaction mechanism at a particular zone. See *Mixture Materials* (p. 800) for details about these methods and the related inputs.

(Note that the **Reaction Mechanisms** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)



Controls

Number of Mechanisms
specifies the number of mechanisms present.

Mechanism ID
is the ID of the mechanism that you specify.

Name
allows you to enter a name for the mechanism.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reaction Type
specifies the type of reaction to be displayed for the mechanism.

Volumetric
displays all volumetric reactions under the **Reactions** list.

Wall Surface
displays all wall surface reactions under the **Reactions** list.

Particle Surface
displays all particle surface reactions under the **Reactions** list.

All
displays all types of reactions under the **Reactions** list.

Reactions
displays the list of reactions of the category specified under **Reaction Type**.

Number of Sites
specifies the number of sites at which you can specify the reaction.

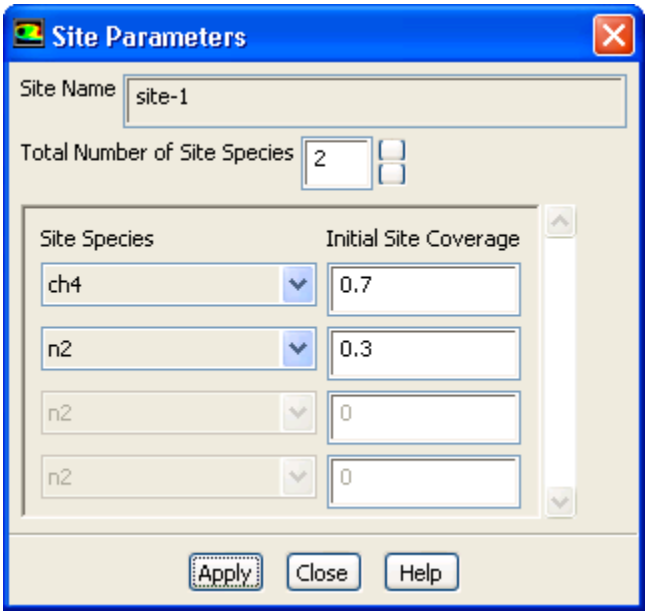
Site Name
contains the name of the site.

Site Density
allows you to specify the site density of the species

Define...
opens the *Site Parameters Dialog Box* (p. 1772).

35.4.29. Site Parameters Dialog Box

The **Site Parameters** dialog box (opened by clicking on the **Define...** button next to **Site Density** in the *Reaction Mechanisms Dialog Box* (p. 1771)) allows you to define the coverage for each site species.



Controls

Site Name
displays the name of site.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Total Number of Site Species
specifies the total number of site species.

Site Species
allows you to select the site species.

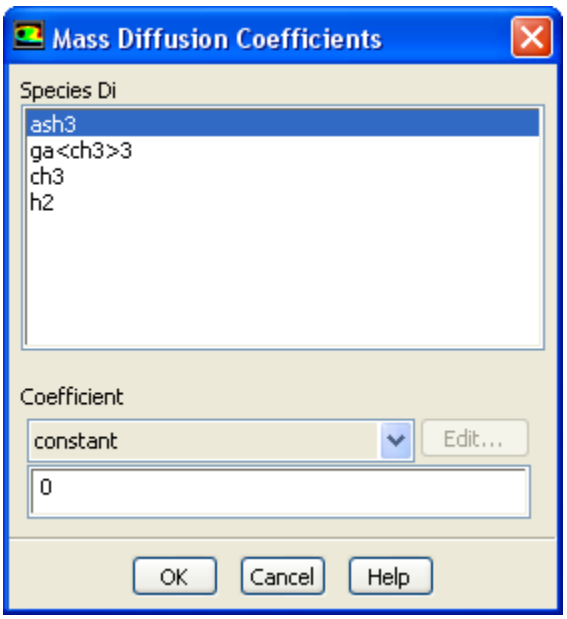
Initial Site Coverage
allows you to specify the initial coverage of the site species.

35.4.30. Mass Diffusion Coefficients Dialog Box

The **Mass Diffusion Coefficients** dialog box (opened by clicking on the **Edit...** button next to **Mass Diffusivity** in the *Create/Edit Materials Dialog Box* (p. 1736)allows you to define the diffusion coefficients of the species in the mixture. Its contents will depend on the method you selected for **Mass Diffusivity**. See *Mass Diffusion Coefficient Inputs* (p. 442) for details about these methods and the related inputs.

(Note that the **Mass Diffusion Coefficients** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

For the **dilute-approx** method:



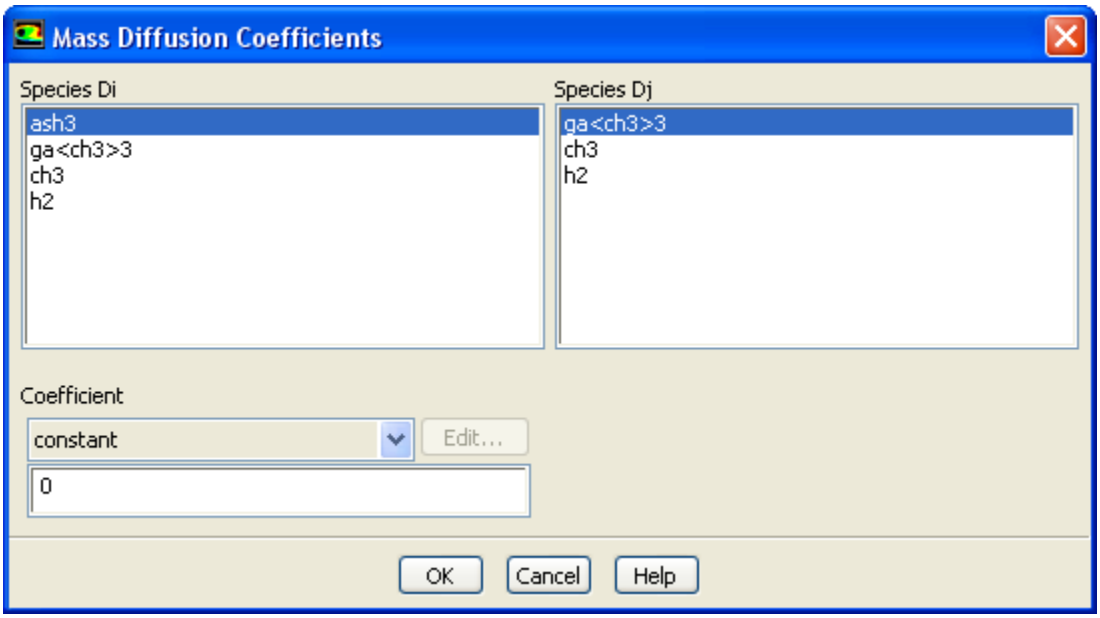
Controls

Species Di
contains a selectable list of all species in the mixture, from which you can select each species and specify its diffusion coefficient.

Coefficient
sets the diffusion coefficient for the selected species in the mixture.

For the **multicomponent** method:

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Species Di, Species Dj
contain selectable lists of species in the mixture, from which you can select each pair of species and specify the diffusion coefficient of the selected **Species Di** in the selected **Species Dj**.

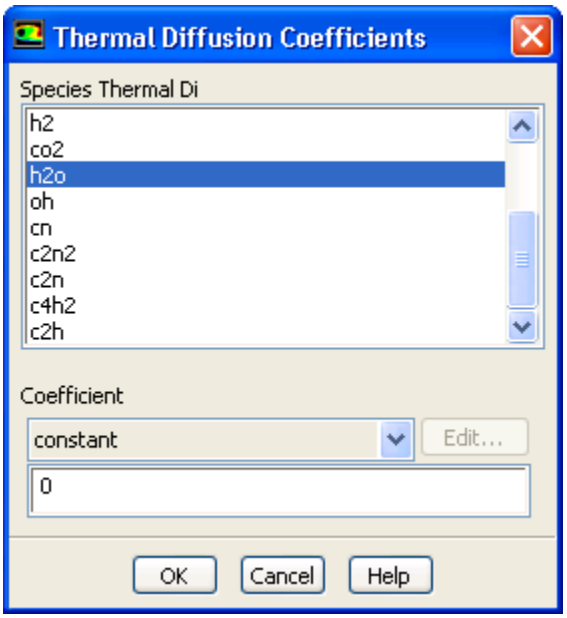
Coefficient
sets the diffusion coefficient for **Species Di** in **Species Dj** (which is equivalent to the diffusion coefficient for **Species Dj** in **Species Di**).

35.4.31. Thermal Diffusion Coefficients Dialog Box

The **Thermal Diffusion Coefficients** dialog box (opened by clicking on the **Edit...** button next to **Thermal Diffusion Coefficient** in the *Create/Edit Materials Dialog Box* (p. 1736)allows you to define the thermal diffusion coefficients of the species in the mixture. See *Thermal Diffusion Coefficient Inputs* (p. 445) for details about these methods and the related inputs.

(Note that the **Thermal Diffusion Coefficients** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Species Thermal Di

contains a selectable list of all species in the mixture, from which you can select each species and specify its thermal diffusion coefficient.

Coefficient

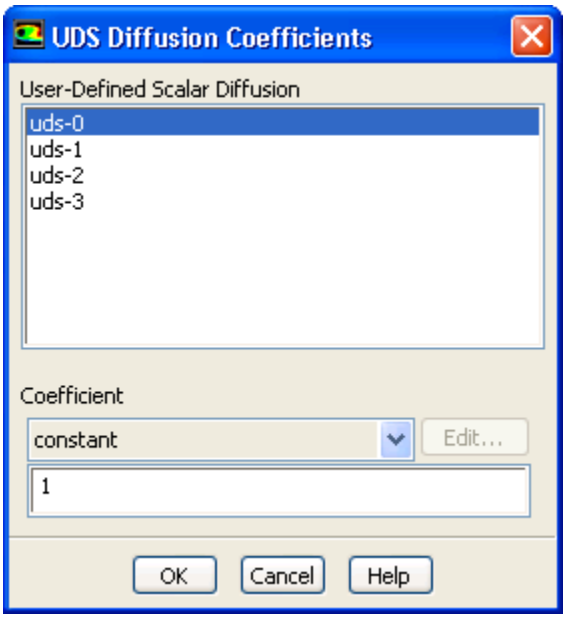
sets the thermal diffusion coefficient for the selected species in the mixture.

35.4.32. UDS Diffusion Coefficients Dialog Box

The **UDS Diffusion Coefficients** dialog box (opened by selecting **uds** and clicking on the **Edit...** button next to **UDS Diffusivity** in the *Create/Edit Materials Dialog Box* (p. 1736)) allows you to define the diffusion coefficients for your user-defined scalar transport equations.

(Note that the **UDS Diffusion Coefficients** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



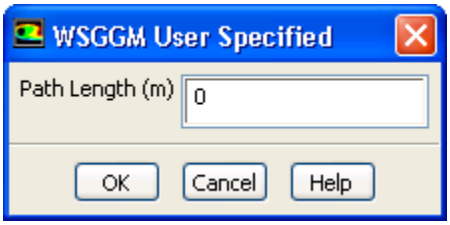
Controls

User-Defined Scalar Diffusion
contains a selectable list of all user-defined scalars, from which you can select each one and specify its diffusion coefficient.

Coefficient
sets the diffusion coefficient for the selected user-defined scalar.

35.4.33. WSGGM User Specified Dialog Box

The **WSGGM User Specified** dialog box allows you to set the path length for the WSGGM when you choose **wsggm-user-specified** as the input method for a composition-dependent **Absorption Coefficient** in the *Create/Edit Materials Dialog Box* (p. 1736). See *Radiation Properties* (p. 435) for details.



Controls

Path Length
sets the path length for the weighted-sum-of-gray-gases model.

35.4.34. Gray-Band Absorption Coefficient Dialog Box

The **Gray-Band Absorption Coefficient** allows you to specify a different absorption coefficient in each gray band when you are modeling non-gray radiation with the P-1 model or the DO model (see The P-1 Model Equations or The DO Model Equations in the Theory Guide and *Setting Up the P-1 Model with Non-Gray Radiation* (p. 706) or *Defining Non-Gray Radiation for the DO Model* (p. 721)). This dialog box will open when you select **gray-band** in the drop-down list next to **Absorption Coefficient** in the *Create/Edit Materials Dialog Box* (p. 1736).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

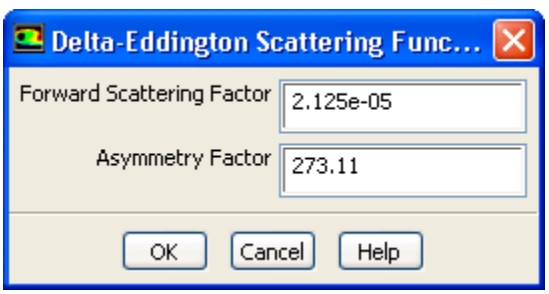
Controls

band n

specifies the absorption coefficient for the nth gray band.

35.4.35. Delta-Eddington Scattering Function Dialog Box

The **Delta-Eddington Scattering Function** dialog box allows you to define the parameters used in the Delta-Eddington phase function for radiation scattering. This dialog box will open when you select **delta-eddington** in the drop-down list next to **Scattering Phase Function** in the *Create/Edit Materials Dialog Box* (p. 1736). See Anisotropic Scattering for details about the items below.



Controls

Forward Scattering Factor

specifies the value of f in Equation 5–68 in the Theory Guide.

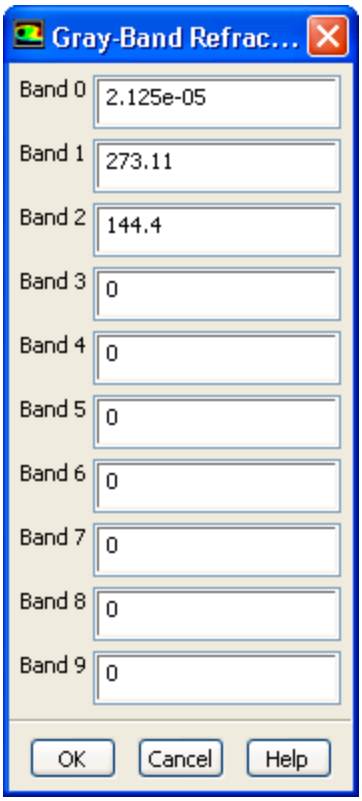
Asymmetry Factor

specifies the value of C in Equation 5–68 in the Theory Guide.

35.4.36. Gray-Band Refractive Index Dialog Box

The **Gray-Band Refractive Index** allows you to specify a different refractive index in each gray band when you are modeling non-gray radiation with the P-1 model or the DO model (see The P-1 Model Equations or The DO Model Equations in the Theory Guide and *Setting Up the P-1 Model with Non-Gray Radiation* (p. 706) or *Defining Non-Gray Radiation for the DO Model* (p. 721)). This dialog box will open when you select **refractive-band** in the drop-down list next to **Refractive Index** in the *Create/Edit Materials Dialog Box* (p. 1736).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

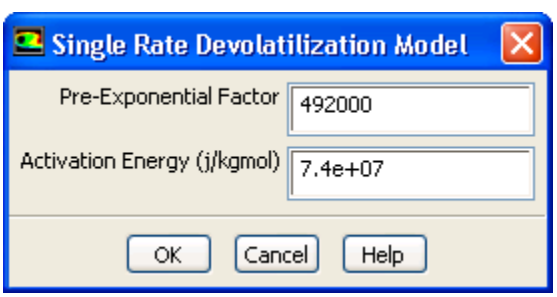
Band n

specifies the refractive index for the nth gray band.

35.4.37. Single Rate Devolatilization Dialog Box

The **Single Rate Devolatilization Model** dialog box (which opens when you select **single-rate** as the **Devolatilization** in the *Create/Edit Materials Dialog Box* (p. 1736) allows you to input the parameters used in the single kinetic rate devolatilization model. See Devolatilization (Law 4) in the Theory Guide for details.

Note that the **Single Rate Devolatilization Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.



Controls

Pre-exponential Factor

sets the value of A_1 in Equation 16–99 in the Theory Guide for the computation of the kinetic rate.

Activation Energy

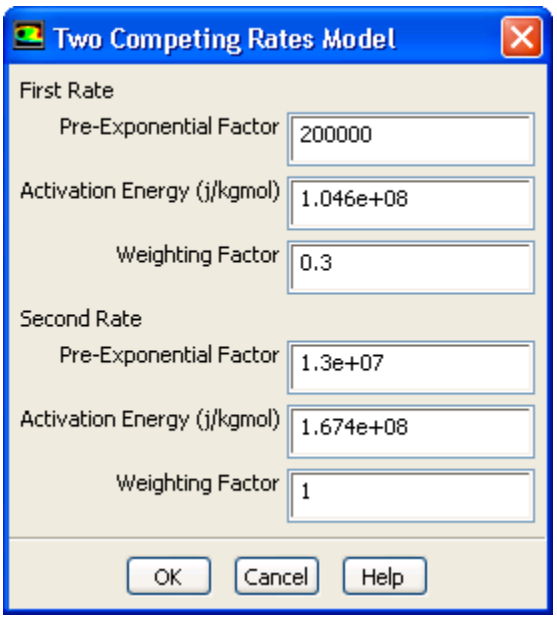
sets the value of E in Equation 16–99 in the Theory Guide for the computation of the kinetic rate.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.4.38. Two Competing Rates Model Dialog Box

The **Two Competing Rates Model** dialog box (which opens when you select **two-competing-rates** as the **Devolatilization Model** in the *Create/Edit Materials Dialog Box* (p. 1736) allows you to input the parameters used for each of the competing rates in the two-competing-rates devolatilization model. See Devolatilization (Law 4) in the Theory Guide for details.

Note that the **Two Competing Rates Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.



Controls

First Rate

sets parameters for the first of the two rates.

Pre-exponential Factor

sets the value of A_1 in Equation 16–101 in the Theory Guide for the computation of the kinetic rate.

Activation Energy

sets the value of E_1 in Equation 16–101 in the Theory Guide for the computation of the kinetic rate.

Weighting Factor

sets the value of α_1 in Equation 16–103 in the Theory Guide.

Second Rate

sets parameters for the second of the two rates.

Pre-exponential Factor

sets the value of A_2 in Equation 16–102 in the Theory Guide for the computation of the kinetic rate.

Activation Energy

sets the value of E_2 in Equation 16–102 in the Theory Guide for the computation of the kinetic rate.

Weighting Factor

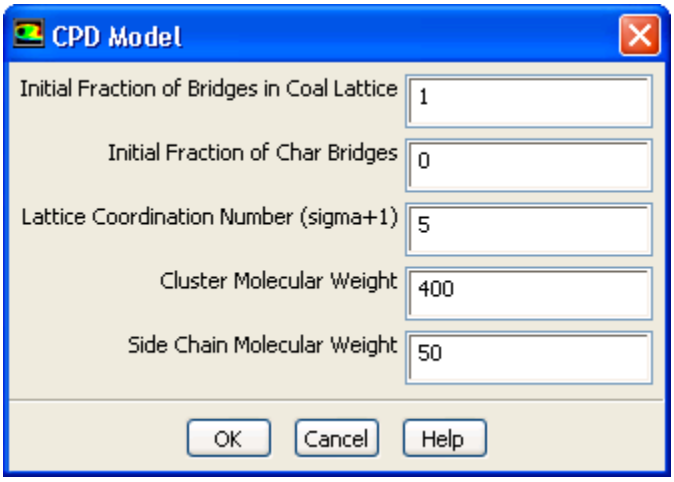
sets the value of α_2 in Equation 16–103 in the Theory Guide.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.4.39. CPD Model Dialog Box

The **CPD Model** dialog box (which opens when you select **cpd-model** as the **Devolatilization Model** in the *Create/Edit Materials Dialog Box* (p. 1736)) allows you to input the parameters used in the CPD devolatilization model. See Devolatilization (Law 4) in the Theory Guide for details.

Note that the **CPD Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.



Controls

Initial Fraction of Bridges in Coal Lattice
sets the value of p_0 in Equation 16–114 in the Theory Guide.

Initial Fraction of Char Bridges
sets the value of c_0 in Equation 16–113 in the Theory Guide.

Lattice Coordination Number
sets the value of $\sigma + 1$ in Equation 16–125 in the Theory Guide.

Cluster Molecular Weight
sets the value of $M_{w,1}$ in Equation 16–125 in the Theory Guide.

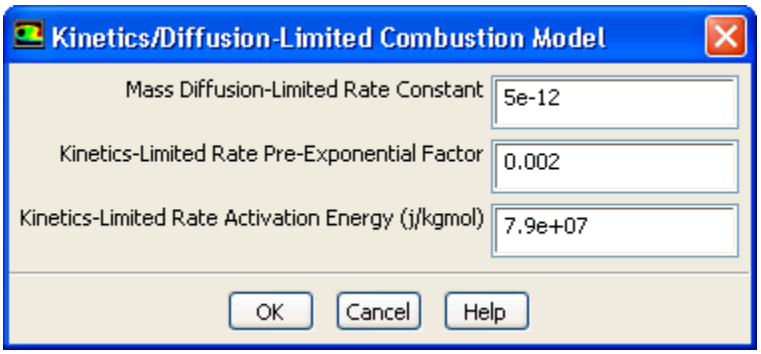
Side Chain Molecular Weight
sets the value of $M_{w,\delta}$ in Equation 16–124 in the Theory Guide.

35.4.40. Kinetics/Diffusion-Limited Combustion Model Dialog Box

The **Kinetics/Diffusion-Limited Combustion Model** dialog box (which opens when you select **kinetics/diffusion-limited** as the **Combustion Model** in the *Create/Edit Materials Dialog Box* (p. 1736) allows you to input the parameters used for the kinetics/diffusion-limited rate surface combustion model. See Surface Combustion (Law 5) in the Theory Guide for details.

Note that the **Kinetics/Diffusion-Limited Combustion Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Mass Diffusion-Limited Rate Constant

sets the value for C_1 in Equation 16–137 in the Theory Guide.

Kinetics-Limited Rate Pre-exponential Factor

sets the value for C_2 in Equation 16–138 in the Theory Guide.

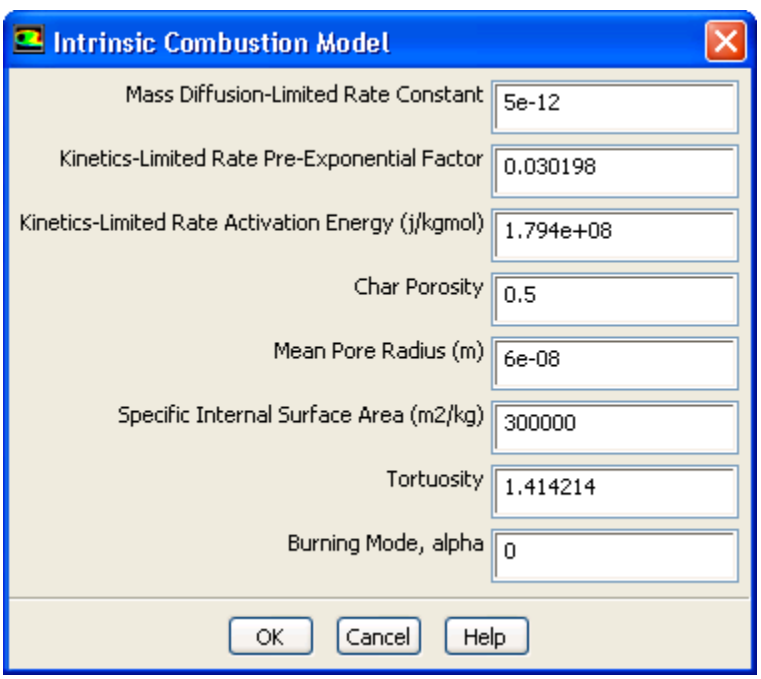
Kinetics-Limited Rate Activation Energy

sets the value for E in Equation 16–138 in the Theory Guide.

35.4.41. Intrinsic Combustion Model Dialog Box

The **Intrinsic Combustion Model** dialog box (which opens when you select **intrinsic-model** as the **Combustion Model** in the *Create/Edit Materials Dialog Box* (p. 1736) allows you to input the parameters used for the intrinsic surface combustion model. See Surface Combustion (Law 5) in the Theory Guide for details.

Note that the **Intrinsic Combustion Model** dialog box is a modal dialog box, which means that you must tend to it immediately before continuing the property definitions.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mass Diffusion-Limited Rate Constant
sets the value for C_1 in Equation 16–137 in the Theory Guide.

Kinetics-Limited Rate Pre-exponential Factor
sets the value for A_i in Equation 16–147 in the Theory Guide.

Kinetics-Limited Rate Activation Energy
sets the value for E_i in Equation 16–147 in the Theory Guide.

Char Porosity
sets the value for θ in Equation 16–144 in the Theory Guide.

Mean Pore Radius
sets the value for $\bar{r}_p$ in Equation 16–146 in the Theory Guide.

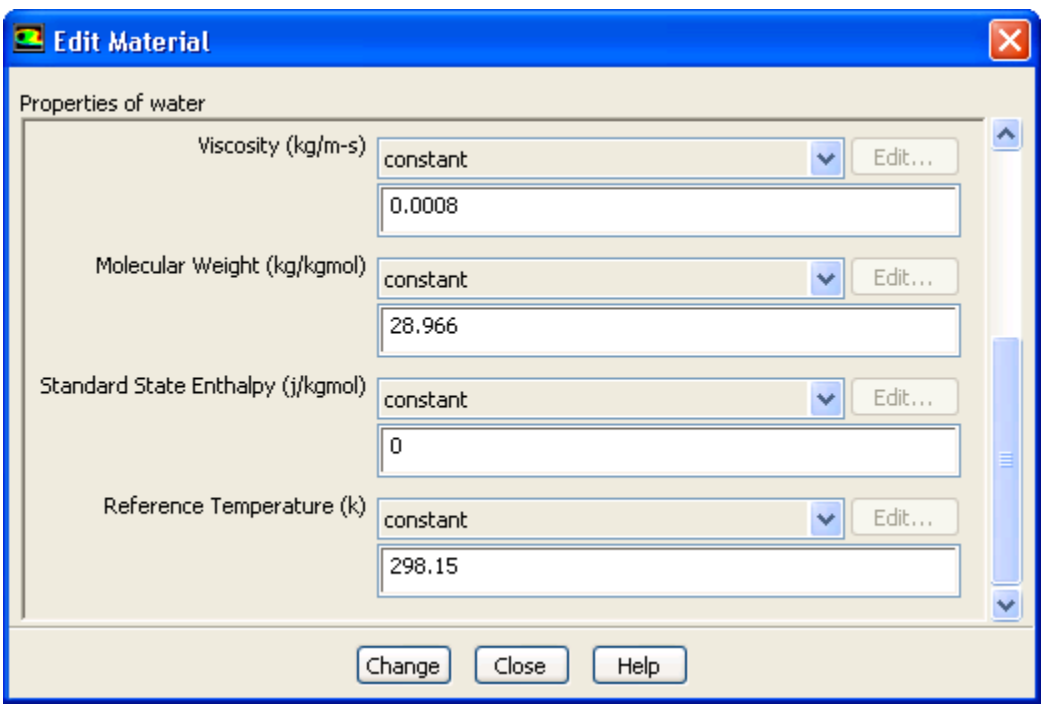
Specific Internal Surface Area
sets the value for A_g in Equation 16–141 and Equation 16–143 in the Theory Guide.

Tortuosity
sets the value for τ in Equation 16–144 in the Theory Guide.

Burning Mode, alpha
sets the value for α in Equation 16–148 in the Theory Guide.

35.4.42. Edit Material Dialog Box

The **Edit Material** dialog box contains the portion of the *Create/Edit Materials Dialog Box* (p. 1736)that contains the properties for a specific material. It is opened from the *Primary Phase Dialog Box* (p. 1784), *Secondary Phase Dialog Box* (p. 1785), *Wall Dialog Box* (p. 1865), *Fluid Dialog Box* (p. 1796), or *Solid Dialog Box* (p. 1802).



Controls

Properties of material-n
contains a list of the properties of material-n. The items in the list are the same as those in the *Create/Edit Materials Dialog Box* (p. 1736).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

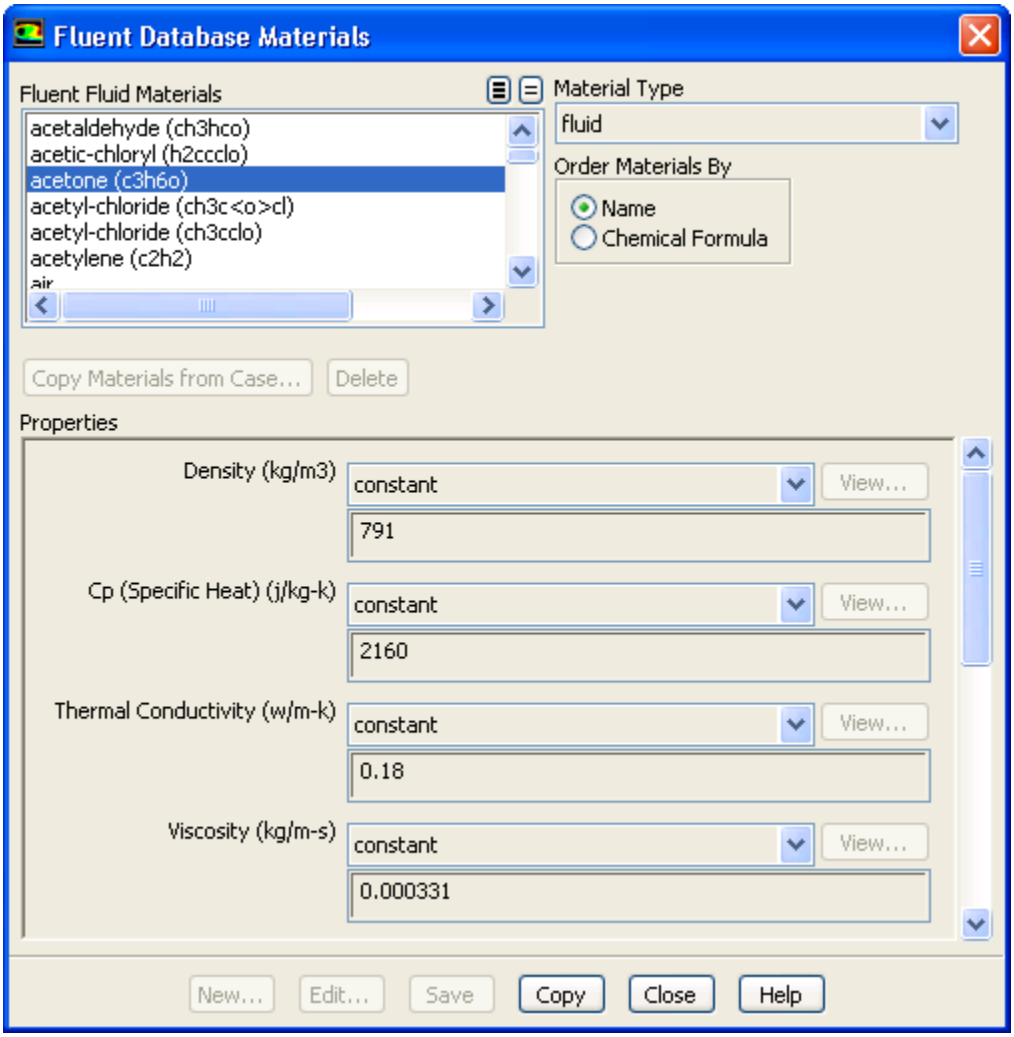
Change

applies any changes you have made to the properties of the material.

35.4.43. Fluent Database Materials Dialog Box

The **Fluent Database Materials** dialog box contains the portion of the *FLUENT Database Materials Dialog Box* (p. 1744) that contains the properties for a specific material. It is opened from the *Species Model Dialog Box* (p. 1681).

*There are two dialog boxes with name **FLUENT Database Materials**. The other dialog box opens up when you click the **FLUENT Database...** button in the Create/Edit Materials Dialog Box (p. 1736).*



Controls

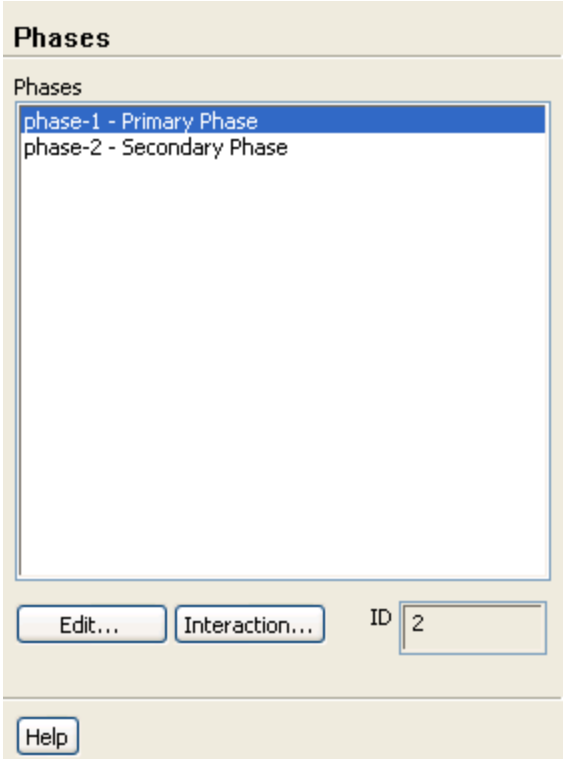
Database Properties of material-n

contains a list of the properties of material-n. The items in the list are the same as those in the *FLUENT Database Materials Dialog Box* (p. 1744).

35.5. Phases Task Page

The **Phases** task page allows you to define each of the phases and the interaction between them. See *Defining the Phases* (p. 1098) – *Defining the Phases for the Eulerian Model* (p. 1154) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Phases
contains a list of all of the phases in the problem from which you can select the phase you want to define or modify. A phase can be a **Primary Phase** or a **Secondary Phase**. You cannot change a phase from primary to secondary, or vice versa. Instead, you can redefine the properties of the primary phase to reflect the new phase designated as primary, and redefine the secondary phases accordingly as well.

Edit...
opens either the *Primary Phase Dialog Box* (p. 1784) or the *Secondary Phase Dialog Box* (p. 1785), where you can define the properties of the selected primary or secondary phase.

Interaction...
opens the *Phase Interaction Dialog Box* (p. 1791), where you can define the interaction between the phases (e.g., surface tension if you are using the VOF model, slip velocity functions if you are using the mixture model, or drag functions if you are using the Eulerian model).

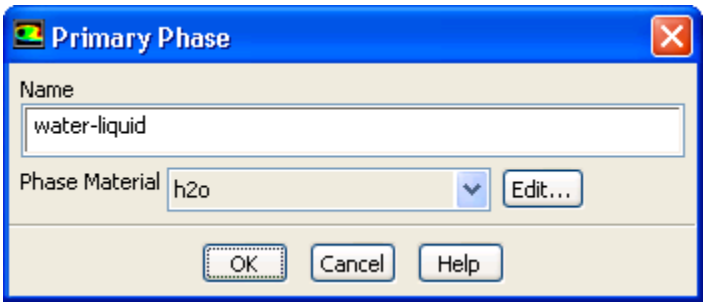
ID
displays the ID number of the phase. You will need this number only if you are writing a user-defined function. See the separate UDF Manual for details about writing user-defined functions for multiphase applications.

For additional information, please see the following sections:
35.5.1. Primary Phase Dialog Box
35.5.2. Secondary Phase Dialog Box
35.5.3. Discrete Phase Dialog Box
35.5.4. Phase Interaction Dialog Box

35.5.1. Primary Phase Dialog Box

The **Primary Phase** dialog box allows you to set the properties of the primary phase. It is opened from the *Phases Task Page* (p. 1783). See *Defining the Phases for the VOF Model* (p. 1136) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name
specifies the name of the phase.

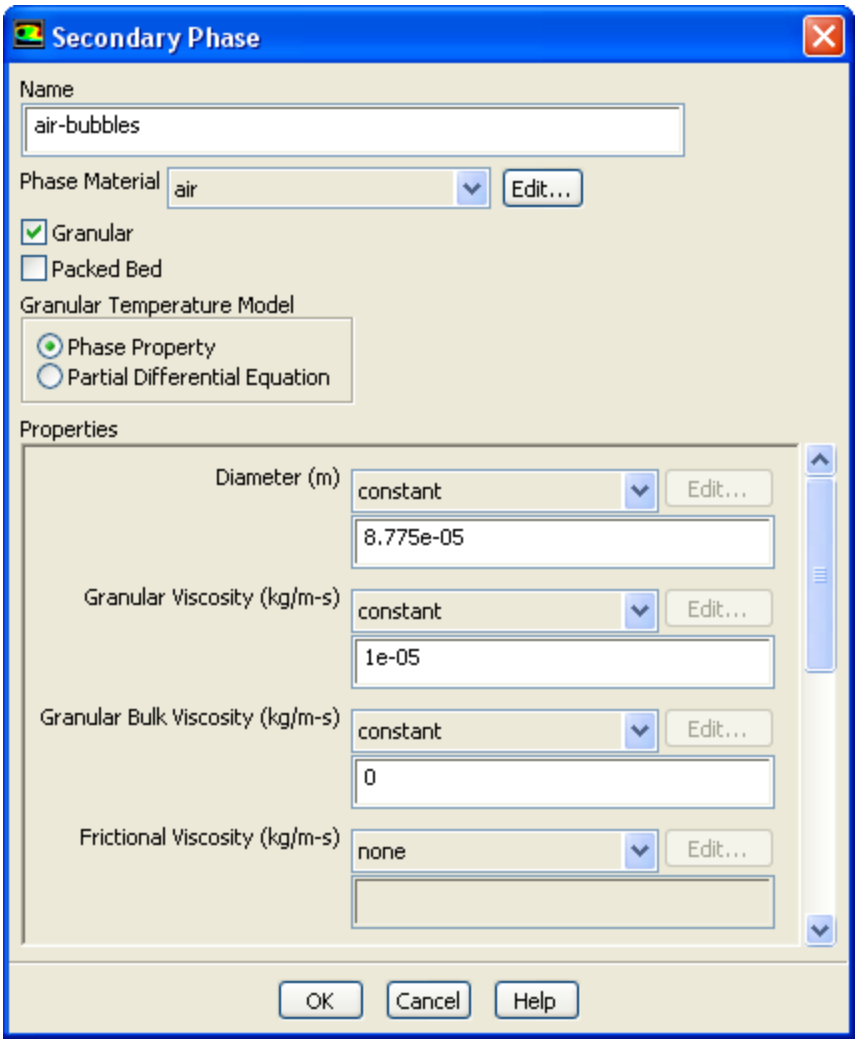
Phase Material
contains a drop-down list of available materials, from which you can select the appropriate one for this phase.

Edit...
opens the *Edit Material Dialog Box* (p. 1782) for the selected **Phase Material**, where you can modify its properties.

35.5.2. Secondary Phase Dialog Box

The **Secondary Phase** dialog box allows you to set the properties of a secondary phase. It is opened from the *Phases Task Page* (p. 1783). The items that appear in the **Secondary Phase** dialog box will depend on which multiphase model you are using. See *Defining the Phases for the VOF Model* (p. 1136), *Defining the Phases for the Mixture Model* (p. 1145), and *Defining the Phases for the Eulerian Model* (p. 1154) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the phase.

Phase Material

contains a drop-down list of available materials, from which you can select the appropriate one for the phase.

Edit...

opens the *Edit Material Dialog Box* (p. 1782) for the selected **Phase Material**, where you can modify its properties.

Granular

indicates whether or not this is a solid phase. This item appears only for the Eulerian model.

Packed Bed

indicates whether or not the granular phase is a packed bed. This option appears only if **Granular** is enabled.

Granular Temperature Model

lists the granular temperature models.

Phase Property

enables phase property model for granular temperature.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Partial Differential Equation

enables partail differential equation model for granular temperature. See Granular Temperature in the Theory Guide for details.

Interfacial Area Concentration

is used to predict mass, momentum and energy transfers through the interface between the phases. See Interfacial Area Concentration in the Theory Guide for details.

Properties

contains a list of phase-specific properties. This section of the dialog box will not appear for the VOF model. The **Diameter** appears for both the mixture model and the Eulerian model, but all of the others will appear only for a granular phase with the Eulerian model.

Diameter

specifies the diameter of the particles. You can select **constant** in the drop-down list and specify a constant value, or select **user-defined** to use a user-defined function. See the separate UDF Manual for details about user-defined functions.

Granular Viscosity

specifies the kinetic part of the granular viscosity of the particles ($\mu_{s,kin}$ in Equation 17–198 in the Theory Guide). You can select **constant** (the default) in the drop-down list and specify a constant value, select **syamlal-obrien** to compute the value using Equation 17–200 in the Theory Guide, select **gidaspow** to compute the value using Equation 17–201 in the Theory Guide, or select **user-defined** to use a user-defined function.

Granular Bulk Viscosity

specifies the solids bulk viscosity (λ_q in Equation 17–121 in the Theory Guide). You can select **constant** (the default) in the drop-down list and specify a constant value, select **lun-et-al** to compute the value using Equation 17–202 in the Theory Guide, or select **user-defined** to use a user-defined function.

Frictional Viscosity

specifies a shear viscosity based on the viscous-plastic flow ($\mu_{s,fr}$ in Equation 17–198 in the Theory Guide). By default, the frictional viscosity is neglected, as indicated by the default selection of **none** in the drop-down list. If you want to include the frictional viscosity, you can select **constant** and specify a constant value, select **schaeffer** to compute the value using Equation 17–203 in the Theory Guide, **johnson-et-al**, or select **user-defined** to use a user-defined function.

Angle Of Internal Friction

specifies a constant value for the angle ϕ used in Schaeffer's expression for frictional viscosity (Equation 17–203 in the Theory Guide). This parameter is relevant only if you have selected **schaeffer**, **johnson-et-al**, or **user-defined** for the **Frictional Viscosity**.

Frictional Pressure

specifies the pressure gradient term, $\nabla P_{friction}$, in the granular-phase momentum equation. Choose **none** to exclude frictional pressure from your calculation, **johnson-et-al** to apply Equation 17–208 in the Theory Guide, **syamlal-et-al** to apply Equation 17–148 in the Theory Guide, **based-ktgf**, where the frictional pressure is defined by the kinetic theory [*20*] (p. 2210). The solids pressure tends to a large value near the packing limit, depending on the model selected for the radial distribution function. You must hook a user-defined function when selecting the **user-defined** option. See the separate UDF Manual for information on hooking a UDF.

Frictional Modulus

can be set as **derived**, or as a **user-defined** function. This is defined as *Equation 26–5* (p. 1148).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Friction Packing Limit

specifies a threshold volume fraction at which the frictional regime becomes dominant. It is assumed that for a maximum packing limit of 0.6, the frictional regime starts at a volume fraction of about 0.5.

Granular Conductivity

specifies the solids conductivity. You can select **syamlal-obrien**, **gidaspow**, **constant** or **user-defined**.

Granular Temperature

specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles. You can choose either the **algebraic**, the **constant**, or **user-defined** option.

Solids Pressure

specifies the pressure gradient term, ∇p_s, in the granular-phase momentum equation. Choose either the **lun-et-al**, the **syamlal-obrien**, the **ma-ahmadi**, or the **user-defined** option.

Radial Distribution

specifies a correction factor that modifies the probability of collisions between grains when the solid granular phase becomes dense. Choose either the **lun-et-al**, the **syamlal-obrien**, the **ma-ahmadi**, the **arastapour**, or a **user-defined** option.

Elasticity Modulus

is defined as

$$G = \frac{\partial P_s}{\partial \alpha_s} \tag{35–1}$$

with $G \geq 0$.

Choose either the **derived** or **user-defined** options.

Packing Limit

specifies the maximum volume fraction for the granular phase ($\alpha_{s,max}$). For monodispersed spheres the packing limit is about 0.63, which is the default value in ANSYS FLUENT. In polydispersed cases, however, smaller spheres can fill the small gaps between larger spheres, so you may need to increase the maximum packing limit.

Surface Tension

specifies the attractive forces between the interfaces.

Coalescence Kernel

allows you to specify the coalescence kernel. You can select **none**, **constant**, **hibiki-ishii**, **ishii-kim**, or **user-defined**. The two options, **hibiki-ishii** and **ishii-kim**, are described in detail in Interfacial Area Concentration in the Theory Guide.

Breakage Kernel

allows you to specify the breakage kernel. You can select **none**, **constant**, **hibiki-ishii**, **ishii-kim**, or **user-defined**. The two options, **hibiki-ishii** and **ishii-kim**, are described in detail in Interfacial Area Concentration in the Theory Guide.

Dissipation Function

gives you the option to choose the formula which calculates the dissipation rate used in the **hibiki-ishii** and **ishii-kim** models. You can choose amongst **constant**, **wu-ishii-kim**, **fluent-ke**, and **user-defined** for the dissipation function.

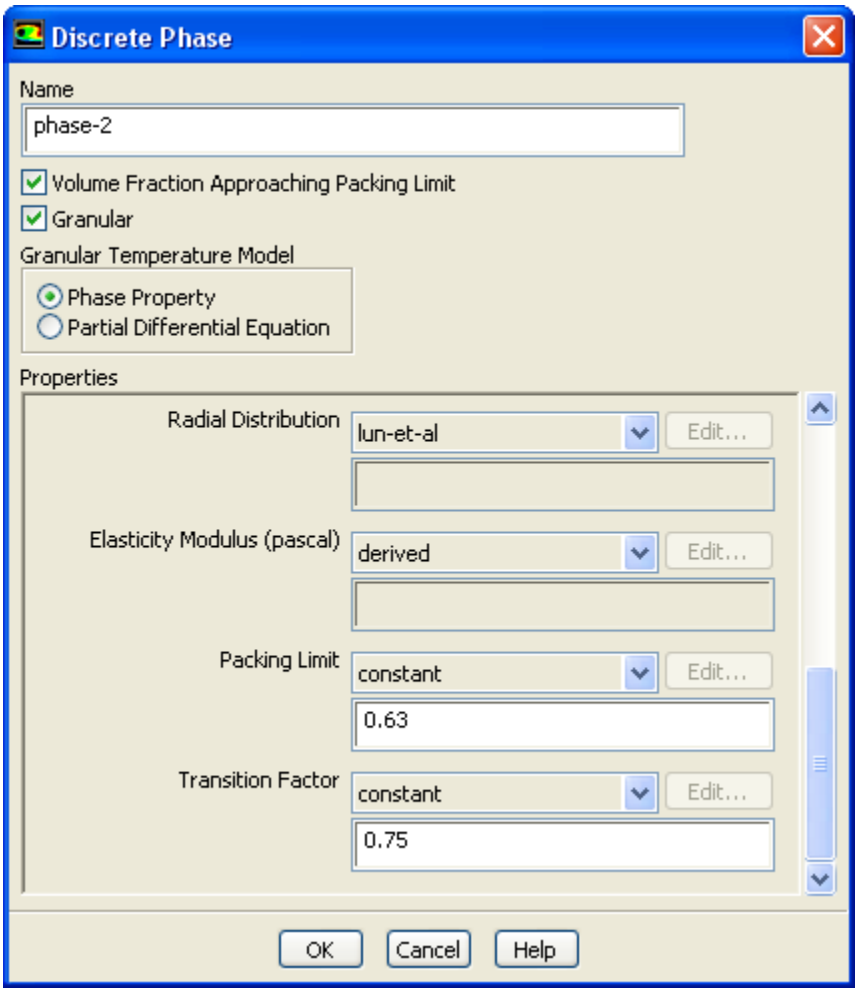
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Hydraulic Diameter
is the value used in *Equation 26–7* (p. 1151). This is available when the **wu-ishii-kim** formulation is selected as the **Dissipation Function**.

Min/Max Diameter
are the limits of the bubble diameters.

35.5.3. Discrete Phase Dialog Box

The **Discrete Phase** dialog box allows you to set the properties of a discrete phase. It is opened from the *Phases Task Page* (p. 1783). The items will appear in the **Discrete Phase** dialog box when the **Dense Discrete Phase Model** option is enabled in the **Multiphase Model** dialog box. See *Including the Dense Discrete Phase Model* (p. 1167) for details about the items below.



Controls

Name
specifies the name of the phase.

Volume Fraction Approaching Continuous Flow Limit
appears for non-granular flows. When this option is enabled, only the **Transition Factor** needs to be specified.

Volume Fraction Approaching Packing Limit
prevents the unlimited accumulation of particles, which are operating at packing limit conditions.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Granular
indicates whether or not this is a solid phase. This item appears only for the Eulerian model.

Granular Temperature Model
lists the granular temperature models.

Phase Property
enables phase property model for granular temperature.

Partial Differential Equation
enables partial differential equation model for granular temperature. See Granular Temperature in the Theory Guide for details.

Properties
contains a list of phase-specific properties.

Granular Viscosity
specifies the kinetic part of the granular viscosity of the particles ($\mu_{s,kin}$ in Equation 17–198 in the Theory Guide). You can select **constant** (the default) in the drop-down list and specify a constant value, select **syamlal-obrien** to compute the value using Equation 17–200 in the Theory Guide, select **gidaspow** to compute the value using Equation 17–201 in the Theory Guide, or select **user-defined** to use a user-defined function.

Granular Bulk Viscosity
specifies the solids bulk viscosity (λ_q in Equation 17–121 in the Theory Guide). You can select **constant** (the default) in the drop-down list and specify a constant value, select **lun-et-al** to compute the value using Equation 17–202 in the Theory Guide, or select **user-defined** to use a user-defined function.

Frictional Viscosity
specifies a shear viscosity based on the viscous-plastic flow ($\mu_{s,fr}$ in Equation 17–198 in the Theory Guide). By default, the frictional viscosity is neglected, as indicated by the default selection of **none** in the drop-down list. If you want to include the frictional viscosity, you can select **constant** and specify a constant value, select **schaeffer** to compute the value using Equation 17–203 in the Theory Guide, **johnson-et-al**, or select **user-defined** to use a user-defined function.

Angle Of Internal Friction
specifies a constant value for the angle ϕ used in Schaeffer's expression for frictional viscosity (Equation 17–203 in the Theory Guide). This parameter is relevant only if you have selected **schaeffer**, **johnson-et-al**, or **user-defined** for the **Frictional Viscosity**.

Frictional Pressure
specifies the pressure gradient term, $\nabla P_{friction}$, in the granular-phase momentum equation. Choose **none** to exclude frictional pressure from your calculation, **johnson-et-al** to apply Equation 17–208 in the Theory Guide, **syamlal-obrien** to apply Equation 17–148 in the Theory Guide, **based-ktgf**, where the frictional pressure is defined by the kinetic theory [*20*] (p. 2210). The solids pressure tends to a large value near the packing limit, depending on the model selected for the radial distribution function. You must hook a user-defined function when selecting the **user-defined** option. See the separate UDF Manual for information on hooking a UDF.

Frictional Modulus
can be set as **derived**, or as a **user-defined** function. This is defined as *Equation 26–5* (p. 1148).

Friction Packing Limit
specifies a threshold volume fraction at which the frictional regime becomes dominant. It is assumed that for a maximum packing limit of 0.6, the frictional regime starts at a volume fraction of about 0.5.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Granular Conductivity

specifies the solids conductivity. You can select **syamlal-obrien**, **gidaspow**,or **user-defined**.

Solids Pressure

specifies the pressure gradient term, ∇p_s, in the granular-phase momentum equation. Choose either the **lun-et-al**, the **syamlal-obrien**, the **ma-ahmadi**, or the **user-defined** option.

Radial Distribution

specifies a correction factor that modifies the probability of collisions between grains when the solid granular phase becomes dense. Choose either the **lun-et-al**, the **syamlal-obrien**, the **ma-ahmadi**, the **arastapour**, or a **user-defined** option.

Elasticity Modulus

is defined as

$$G = \frac{\partial P_s}{\partial \alpha_s} \tag{35–2}$$

with $G \geq 0$.

Choose either the **derived** or **user-defined** options.

Packing Limit

specifies the maximum volume fraction for the granular phase ($\alpha_{s,max}$). For monodispersed spheres the packing limit is about 0.63, which is the default value in ANSYS FLUENT. In polydispersed cases, however, smaller spheres can fill the small gaps between larger spheres, so you may need to increase the maximum packing limit.

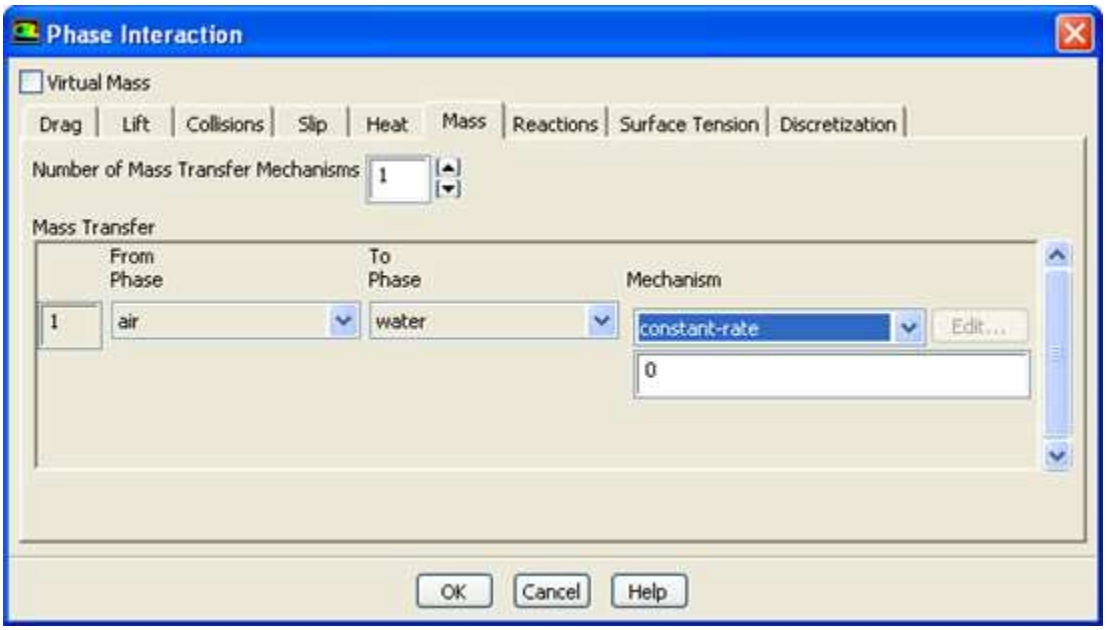
Transition Factor

is specified as either a **constant** or a **user-defined** function. The default value is assumed to be 0.75, which corresponds to the closest sphere packing for monosized spheres (a factor of 4/3). In other words, the transition criterion is based on the local particle volume fraction of the given discrete phase and is specified as a factor multiplied by the maximum packing limit (also a user specified value).

35.5.4. Phase Interaction Dialog Box

The **Phase Interaction** dialog box allows you to define the interaction between phases. It is opened from the *Phases Task Page* (p. 1783). The items that appear in the **Phase Interaction** dialog box will depend on which multiphase model you are using. See *Defining the Phases for the VOF Model* (p. 1136), *Defining the Phases for the Mixture Model* (p. 1145), and *Defining the Phases for the Eulerian Model* (p. 1154) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Virtual Mass

includes the "virtual mass force" (F_{vm} in Equation 17–124 in the Theory Guide) that is present when a secondary phase accelerates relative to the primary phase. This item appears only for the Eulerian model.

Drag

displays the **Drag Coefficient** inputs. This tab is active only for the Eulerian and mixture models.

Drag Coefficient

specifies the drag function for each pair of phases. This section of the dialog box appears only for the Eulerian and mixture models. See *Defining the Phases for the Eulerian Model* (p. 1154) for information about the available options.

Lift

displays the **Lift Coefficient** inputs. This tab is active only for the Eulerian model.

Lift Coefficient

specifies the lift function for each pair of phases. This section of the dialog box appears only for the Eulerian model. See *Defining the Phases for the Eulerian Model* (p. 1154) for information about the available options.

Collisions

displays the **Restitution Coefficient** inputs.

Restitution Coefficient

specifies the restitution coefficient for collisions between each pair of granular phases, and for collisions between particles of the same granular phase. It is relevant only if two or more granular phases are involved. See *Defining the Phases for the Eulerian Model* (p. 1154) for information about the available options.

Slip

displays the **Slip Velocity** inputs. This tab is active only for the mixture model.

Slip Velocity

specifies the slip velocity function for each secondary phase with respect to the primary phase. See *Defining the Phases for the Mixture Model* (p. 1145) for information about the available options.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Heat

displays the **Heat Transfer Coefficient** inputs. This tab is active only for the Eulerian model when the energy equation is active.

Heat Transfer Coefficient

specifies the heat transfer coefficient function between each pair of phases. See *Including Heat Transfer Effects* (p. 1165) for information about the available options.

Mass

displays the **Mass Transfer Function** inputs.

Number of Mass Transfer Mechanisms

specifies the number of mass transfer mechanisms in your simulation. See *Including Mass Transfer Effects* (p. 1104) for information about the available options.

Reactions

allows you to define multiple heterogeneous reactions and stoichiometry.

Total Number of Heterogeneous Reactions

specifies the total number of reactions (volumetric reactions, wall surface reactions, and particle surface reactions). See *Specifying Heterogeneous Reactions* (p. 1101) for information about the available options.

Heterogeneous Stiff Chemistry Solver

is used in inter-phase reaction mechanisms containing numerically stiff reactions. This option can improve convergence and is available for transient Eulerian multiphase simulations.

Reaction Name

allows you to enter a name for the reaction.

ID

enables you to set the reaction ID for each reaction.

Number of Reactants

allows you to specify the number of reactants that are involved in the reaction.

Number of Products

allows you to specify the number of products that are involved in the reaction.

Phase

drop-down list allows you to select the phase that is involved in the reaction.

Species

drop-down list allows you to select the species.

Stoich. Coefficient

allows you to set the stoichiometric coefficient.

Reaction Rate Function

allows you to choose rate exponents for an Arrhenius-type reaction, a user-defined function, or a population balance mechanism for the reaction rate.

Surface Tension

includes the effects of surface tension along the fluid-fluid interface.

Wall Adhesion

enables the specification of a wall adhesion angle. (The angle itself, as defined in *Figure 26.25* (p. 1141), will be specified in the *Wall Dialog Box* (p. 1865).) This item will appear only for the VOF and Eulerian models.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Jump Adhesion

enables the treatment of the contact angle specification at the porous jump boundary. (The angle itself will be specified in the *Porous Jump Dialog Box* (p. 1842).)

Surface Tension Coefficients

specify the surface tension coefficient, σ in Equation 17–22 in the Theory Guide, for each pair of phases. See *Defining the Phases for the VOF Model* (p. 1136) for details. This quantity can be assigned to a new input parameter (indicated by the **New Input Parameter...** option in the drop-down list). Clicking this option displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters. You can also assign this quantity to compatible (based on units) input parameters that are already available in the drop-down list.

Discretization

allows you to use the diffusive and anti-diffusive discretization procedure across the distinct interfaces.

Phase Localized Compressive Scheme

enables the compressive discretization scheme in ANSYS FLUENT, where the degree of diffusion/sharpness is controlled through the value of the slope limiters. This item will appear only for the VOF model and for the Eulerian model with immiscible fluid.

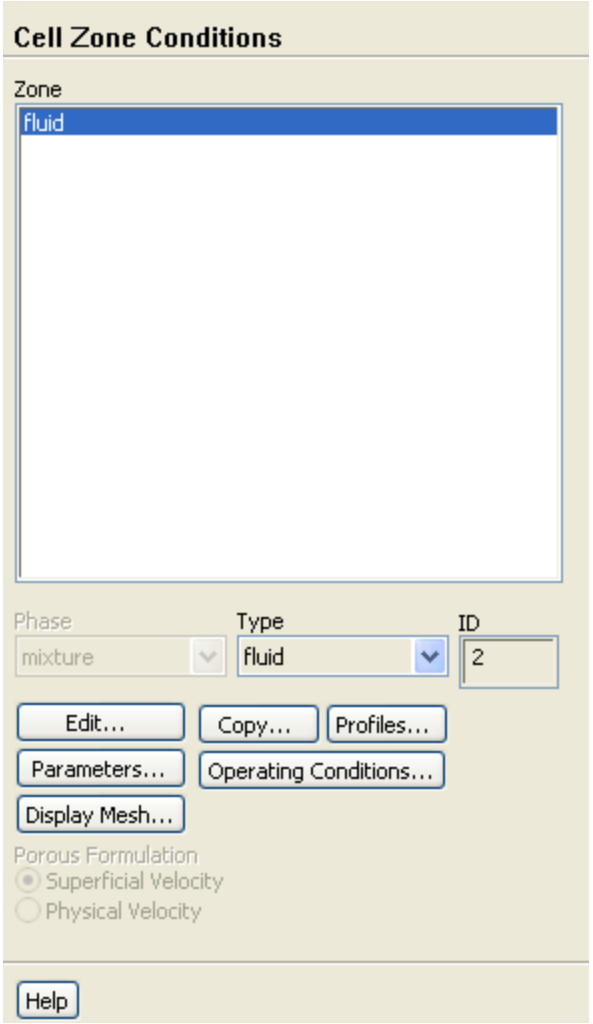
Slope Limiters

are values equating to specific discretization schemes. For each pair of phases, you can enter a value of 0, 1, or 2, or any value between 0 and 2. Depending on the value you use, first order upwind, second order upwind, compressive, or the blended scheme will be applied. Please refer to *Table 26.8: Slope Limiter Discretization Scheme* (p. 1142) to equate each value of the slope limiter with a discretization scheme. For more information, please refer to*Discretizing Using the Phase Localized Compressive Scheme* (p. 1141)

35.6. Cell Zone Conditions Task Page

The **Cell Zones Conditions** task page allows you to set the type of a cell zone and display other dialog boxes to set the cell zone condition parameters for each zone. See *Cell Zone Conditions* (p. 214) for more information.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone

contains a selectable list of available cell zones from which you can select the zone of interest. You can check a zone type by using the mouse probe (see *Controlling the Mouse Button Functions* (p. 1427)) on the displayed physical mesh. This feature is particularly useful if you are setting up a problem for the first time, or if you have two or more cell zones of the same type and you want to determine the cell zone IDs. To do this you must first display the mesh with the *Mesh Display Dialog Box* (p. 1635). Then click the boundary zone with the right (select) mouse button. ANSYS FLUENT will print the cell zone ID and type of that boundary zone in the console window.

Phase

specifies the phase for which conditions at the selected cell **Zone** are being set. This item appears if the VOF, mixture, or Eulerian multiphase model is being used. See *Defining Multiphase Cell Zone and Boundary Conditions* (p. 1107) for details.

Type

contains a drop-down list of condition types for the selected cell zone. The list contains all possible types to which the cell zone can be changed.

ID

displays the cell zone ID number of the selected cell zone. (This is for informational purposes only; you cannot edit this number.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Edit...
opens the *Fluid Dialog Box* (p. 1796) or *Solid Dialog Box* (p. 1802).

Copy...
opens the *Copy Conditions Dialog Box* (p. 1805), which allows you to copy conditions from one cell zone to other cell zones of the same type. See *Copying Cell Zone and Boundary Conditions* (p. 208) for details.

Profiles...
opens the *Profiles Dialog Box* (p. 1808).

Parameters...
opens the *Parameters Dialog Box* (p. 2041).

Operating Conditions...
opens the *Operating Conditions Dialog Box* (p. 1806).

Display Mesh...
opens the *Mesh Display Dialog Box* (p. 1635).

Porous Formulation
contains options for setting the velocity in the porous medium simulation. See *Defining the Porous Velocity Formulation* (p. 227) for details.

Superficial Velocity
enables the superficial velocity in a porous medium simulation. This is the default method.

Physical Velocity
enables the physical velocity in a porous medium simulation for a more accurate simulation. This option is available only for a pressure-based solver. See *Modeling Porous Media Based on Physical Velocity* (p. 237) for details.

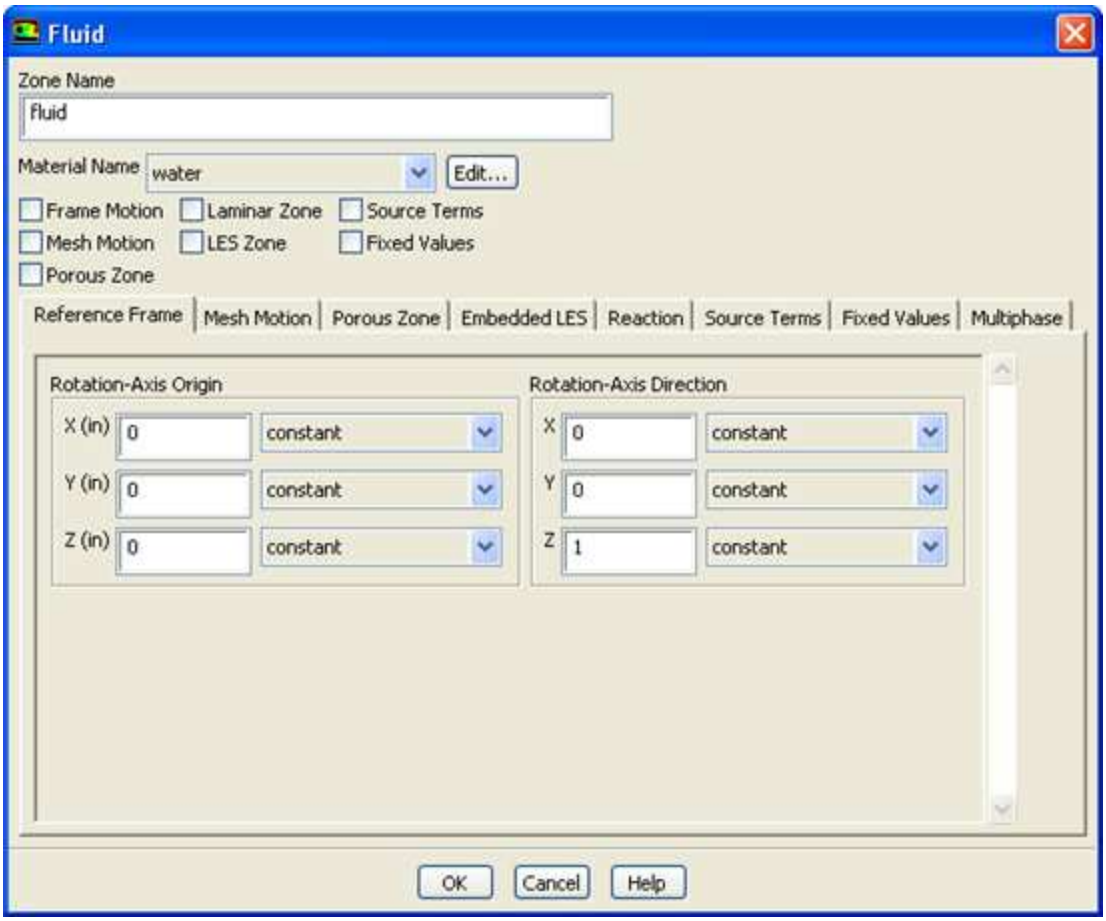
For additional information, please see the following sections:

35.6.1. Fluid Dialog Box
35.6.2. Solid Dialog Box
35.6.3. Copy Conditions Dialog Box
35.6.4. Operating Conditions Dialog Box
35.6.5. Select Input Parameter Dialog Box
35.6.6. Profiles Dialog Box
35.6.7. Orient Profile Dialog Box
35.6.8. Write Profile Dialog Box

35.6.1. Fluid Dialog Box

The **Fluid** dialog box sets the conditions for a fluid cell zone. It is opened from the *Cell Zone Conditions Task Page* (p. 1794). See *Inputs for Fluid Zones* (p. 215) and *User Inputs for Porous Media* (p. 225) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Material Name

sets the fluid material. The drop-down list contains the names of all materials that have been loaded into the solver. Materials are defined with the *Materials Task Page* (p. 1735).

Important

If you are modeling species transport or multiphase flow, the **Material Name** list will not appear in the **Fluid** dialog box. For species calculations, the mixture material for all fluid zones will be the material you specified in the *Species Model Dialog Box* (p. 1681). For multiphase flows, the materials are specified when you define the phases, as described in *Defining the Phases for the VOF Model* (p. 1136).

Frame Motion

enables the moving reference frame model for the cell zone. See *Specifying the Rotation Axis* (p. 217) and *Defining Zone Motion* (p. 217) for details.

Mesh Motion

enables the sliding mesh model for the cell zone. See *Setting Up the Sliding Mesh Problem* (p. 541) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Porous Zone
indicates that the zone is a porous medium. Additional items will appear in the dialog box when this option is enabled. See *User Inputs for Porous Media* (p. 225) for details.

Laminar Zone
disables the calculation of turbulence production in the fluid zone (appears only for turbulent flow calculations using the Spalart-Allmaras model or one of the k- ε or k- ω models). See *Specifying a Laminar Zone* (p. 216) for details.

LES Zone
allows you to model a smaller embedded LES zone within a larger URANS computational domain for turbulent flow calculations. When you turn on this option, the **Embedded LES** tab will be enabled to allow you to specify properties for the embedded LES zone. See *Setting Up the Embedded Large Eddy Simulation (E-LES) Model* (p. 670) for details.

Source Terms
enables the specification of volumetric sources of mass, momentum, energy, etc. When you turn on this option, the **Source Terms** tab will be enabled to allow you to input the values for the desired sources. See *Defining Mass, Momentum, Energy, and Other Sources* (p. 244) for details.

Fixed Values
enables the fixing of the value of one or more variables in the fluid zone, rather than computing them during the calculation. See *Fixing the Values of Variables* (p. 241) for details.

Important

You can fix values for velocity components, temperature, and species mass fractions only if you are using the pressure-based solver.

Participates In Radiation
specifies whether or not the fluid zone participates in radiation. This option appears when you are using the DO model for radiation.

Reaction
enables/disables reactions in the porous zone.

Reference Frame
lists the parameters that define motion for a moving reference frame.

Rotation-Axis Origin
specifies the origin for the axis of rotation of solid zone. See *Specifying the Rotation Axis* (p. 219) for details. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction
specifies the direction vector for the solid zone's axis of rotation. See *Specifying the Rotation Axis* (p. 219) for details. This item will appear only for 3D models.

Rotational Velocity
contains an input field for the rotational **Speed** of the zone.

Translational Velocity
contains inputs for the **X**, **Y**, and **Z** velocities of the zone.

Relative Specification
indicates whether the velocities are absolute velocities (**absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UDF
allows you to hook the DEFINE_ZONE_MOTION UDF.

Copy to Mesh Motion
allows you to switch between the MRF and moving mesh models. The variables used for the origin, axis, and velocity components, as well as for the UDF `DEFINE_ZONE_MOTION` will be copied from one model to the other.

Mesh Motion
lists the parameters that define motion for a moving reference frame.

Rotation-Axis Origin
specifies the origin for the axis of rotation of solid zone. See *Specifying the Rotation Axis* (p. 219) for details. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction
specifies the direction vector for the solid zone's axis of rotation. See *Specifying the Rotation Axis* (p. 219) for details. This item will appear only for 3D models.

Rotational Velocity
contains an input field for the rotational **Speed** of the zone.

Translational Velocity
contains inputs for the **X**, **Y**, and **Z** velocities of the zone.

Relative Specification
indicates whether the velocities are absolute velocities (**absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

UDF
allows you to hook the DEFINE_ZONE_MOTION UDF.

Copy to Frame Motion
allows you to switch between the MRF and moving mesh models. The variables used for the origin, axis, and velocity components, as well as for the UDF `DEFINE_ZONE_MOTION` will be copied from one model to the other.

Porous Zone
lists the parameters associated with the porous zone.

Conical
enables the specification of a conical (or cylindrical) porous medium. This item will appear only when the **Porous Zone** option is enabled for a 3D case.

Cone Half Angle
specifies the angle between the cone's axis and its surface (see *Figure 7.9* (p. 230)). Set this to 0 to define the porous region using a cylindrical coordinate system. This item will appear only when the **Porous Zone** and **Conical** options are enabled.

Snap to Zone
aligns the plane (or line, in 2D) tool with the zone selected in the drop-down list. The tool is centered at the centroid of the zone, with the tool's axis normal to the zone. If this axis is not the desired cone axis, reposition the tool (as described in *Using the Plane Tool* (p. 1367)). When you are satisfied with the axis, click on the **Update From Plane Tool** (or **Update From Line Tool**) button to update the **Cone Axis Vector** fields.

This item will appear only when the **Porous Zone**and **Conical**options are enabled.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Update From Plane Tool

(**Update From Line Tool** in 2D) updates the **Direction-1 Vector** and (in 3D) the **Direction-2 Vector** from the plane tool orientation. If the **Conical** option is enabled, this button will update the **Cone Axis Vector** and the **Point on Cone Axis**. See *Defining the Viscous and Inertial Resistance Coefficients* (p. 228) for details. This item will appear only when the **Porous Zone** option is enabled.

Direction-1 Vector, Direction-2 Vector

indicate the directions for which the resistance coefficients are defined. See *Defining the Viscous and Inertial Resistance Coefficients* (p. 228) for details. These items will appear only when the **Porous Zone** option is enabled, but the **Conical** option is not. (In 2D, only **Direction-1 Vector** will appear.)

Cone Axis Vector

specifies the **X,Y,Z** vector for the cone's axis.

This item will appear only when the **Porous Zone**and **Conical**options are enabled.

Point on Cone Axis

specifies a point on the cone's axis. This point will be used by ANSYS FLUENT to transform the resistances to the Cartesian coordinate system.

This item will appear only when the **Porous Zone**and **Conical**options are enabled.

Relative Velocity Resistance Formulation

allows ANSYS FLUENT to either apply the relative reference frame or the absolute reference frame. This allows for the correct prediction of the source terms.

Viscous Resistance, Inertial Resistance

contain inputs for the viscous resistance coefficient $1/\alpha$ and the inertial resistance coefficient $C2$ in each direction. See *Defining the Viscous and Inertial Resistance Coefficients* (p. 228) for details. These items will appear only when the **Porous Zone** option is enabled.

Alternative Formulation

provides better stability to the calculation when your porous medium is anisotropic.

If you have enabled the **Conical** option, **Direction-1** is the cone axis direction, **Direction-2** is the normal to the cone surface (radial (r) direction for a cylinder), and **Direction-3** is the circumferential (θ) direction.

Power Law Model

contains inputs for the **C0** and **C1** coefficients in the power law model for porous media. See *Using the Power-Law Model* (p. 235) for details.

Fluid Porosity

contains additional inputs for the porous medium. See *User Inputs for Porous Media* (p. 225) for details.

Porosity

sets the volume fraction of fluid within the porous region.

Solid Material Name

specifies the solid material in the porous region.

Reaction

lists the parameters for reactions in the porous zone.

Reaction Mechanism

allows you to specify a defined group, or mechanism, of available reactions. See *Defining Zone-Based Reaction Mechanisms* (p. 816) for details about defining reaction mechanisms.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Surface-to-Volume Ratio

specifies the surface area of the pore walls per unit volume ($\frac{A}{V}$), and can be thought of as a measure of catalyst loading. With this value, ANSYS FLUENT can calculate the total surface area on which the reaction takes place in each cell by multiplying $\frac{A}{V}$ by the volume of the cell.

Source Terms

defines a source of heat, mass, momentum, turbulence, species, or other scalar quantity within the fluid zone.

Fixed Values

lists the fixed parameters of the fluid zone.

Local Coordinate System for Fixed Velocities

enables the specification of fixed cylindrical velocity components instead of Cartesian components. The local coordinate system is defined by the **Rotation-Axis Origin** and **Rotation-Axis Direction**.

This item is available only in 3D, and only when the **Fixed Values** option is on.

Multiphase

allows you to set parameters that are specific to the multiphase models.

Compressive Scheme Slope Limiter

ranges from 0 to 2. For example, a **Compressive Scheme Slope Limiter** of 0 corresponds to first order upwind behavior, a value of 1 corresponds to second order upwind, and a value of 2 applies the compressive scheme. The **Multiphase** tab is available only if **Zonal Discretization** is enabled in the *Multiphase Model Dialog Box* (p. 1642)..

Numeric Beach Treatment

is available when **Open Channel Flow** and/or **Open Channel Wave BC** is enabled in the **Multiphase Model** dialog box (see *Numerical Beach Treatment for Open Channels* (p. 1133) for more detail).

Numerical Beach

when enabled expands the dialog box where you can specify the numerical beach parameters.

Beach Group ID

represents the cell zones sharing the damping length containing the same input parameters.

Damping Type

allows you to choose between **One Dimensional** and **Two Dimensional** damping.

One Dimensional

is the damping treatment in the flow direction.

Two Dimensional

is the damping treatment in the flow and gravity direction.

Compute From Inlet Boundary

is set to **none** by default. If there are available open channel boundaries (velocity-inlet, pressure-inlet, and mass-flow-inlet), boundary names are added to the drop-down list. If you select a boundary from the list, the **Level Inputs** and the **Damping Length Inputs in Flow Direction** will be updated in the interface. You have the option to overwrite the updated inputs with values that are more applicable to your simulation.

Level Inputs

is only available for the **Two Dimensional** damping type.

Free Surface Level

is the same definition as for open channel flow, see *Modeling Open Channel Flows* (p. 1121).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Bottom Level
is the same definition as for open channel flow, see *Modeling Open Channel Flows* (p. 1121), and is valid only for shallow waves. The bottom level is used for calculating the liquid height.

Flow Direction
is the X, Y, and Z (for 3D) components.

Damping Length Inputs in Flow Direction
are required to calculate the start and end points of the damping length in the flow direction.

Damping Length Specification
is only available if **Open Channel Wave BC** is enabled in the **Multiphase Model** dialog box. There are two options you can choose from **End Point and Wave Lengths** or **End and Start Points**.

End Point
is the end point of the damping zone.

Start Point
is the starting point in the flow direction.

Wave Length
is updated automatically if the boundary is selected from the **Compute From Inlet Boundary** drop-down list.

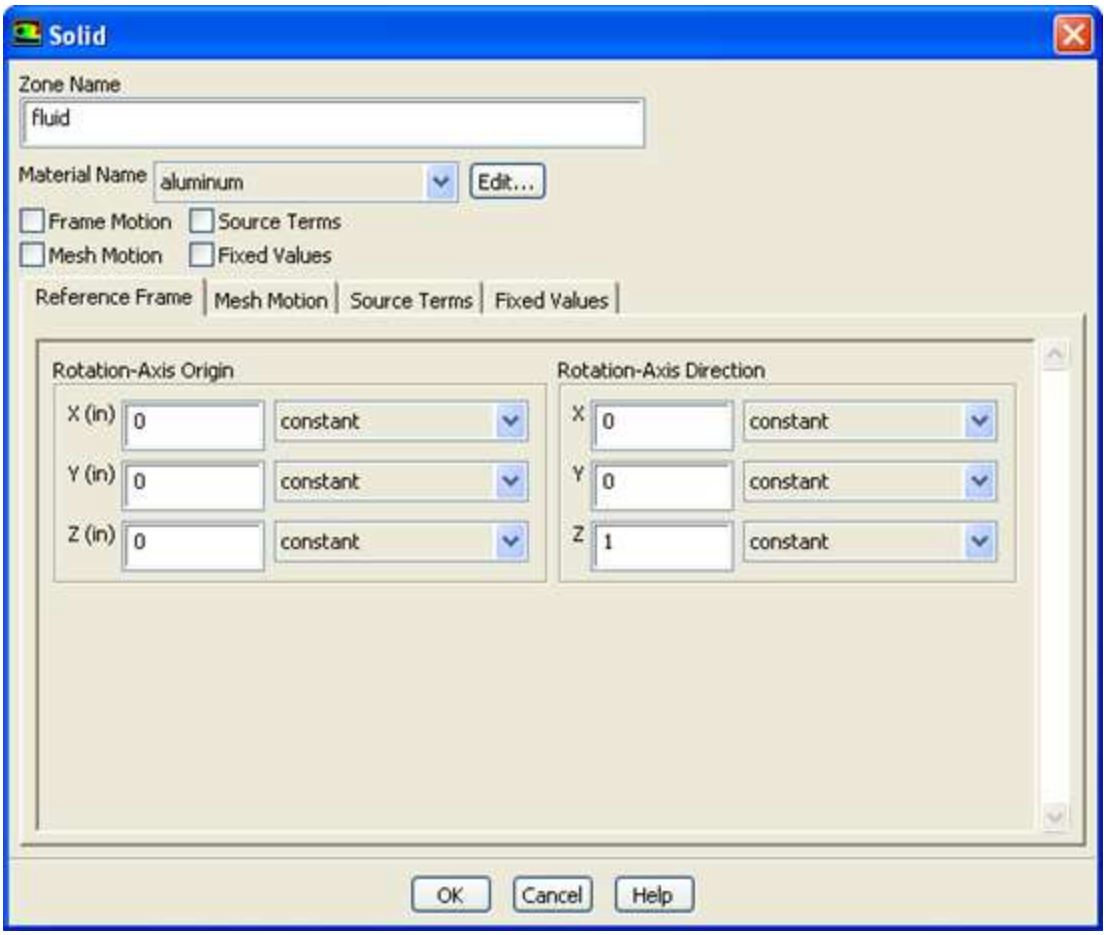
Number Of Wave Lengths
is set to 2 by default for the calculation of the damping length.

Damping Resistance
is the resistance per unit length.

35.6.2. Solid Dialog Box

The **Solid** dialog box sets the boundary conditions for a solid cell zone. It is opened from the *Cell Zone Conditions Task Page* (p. 1794). See *Inputs for Solid Zones* (p. 218) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Material Name

selects the material type of the solid. Materials are defined with the *Materials Task Page* (p. 1735).

Frame Motion

enables the moving reference frame model for the cell zone. See *Specifying the Rotation Axis* (p. 217) and *Defining Zone Motion* (p. 217) for details.

Mesh Motion

enables the sliding mesh model for the cell zone. See *Setting Up the Sliding Mesh Problem* (p. 541) for details.

Source Terms

enables the specification of a volumetric source of energy. When you turn on this option, the **Source Term** tab will allow you to input the value for the energy source. See *Defining Mass, Momentum, Energy, and Other Sources* (p. 244) for details.

Fixed Values

enables the fixing of the value of temperature in the solid zone, rather than computing it during the calculation. See *Fixing the Values of Variables* (p. 241) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Important

You can fix the value of temperature only if you are using the pressure-based solver.

Participates In Radiation
specifies whether or not the solid zone participates in radiation. This option appears when you are using the DO model for radiation.

Reference Frame
lists the parameters that define motion for a moving reference frame.

Rotation-Axis Origin
specifies the origin for the axis of rotation of solid zone. See *Specifying the Rotation Axis* (p. 219) for details. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction
specifies the direction vector for the solid zone's axis of rotation. See *Specifying the Rotation Axis* (p. 219) for details. This item will appear only for 3D models.

Rotational Velocity
contains an input field for the rotational **Speed** of the zone.

Translational Velocity
contains inputs for the **X**, **Y**, and **Z** velocities of the zone.

Relative Specification
indicates whether the velocities are absolute velocities (**absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

UDF
allows you to hook the DEFINE_ZONE_MOTION UDF.

Copy to Mesh Motion
allows you to switch between the MRF and moving mesh models. The variables used for the origin, axis, and velocity components, as well as for the UDF `DEFINE_ZONE_MOTION` will be copied from one model to the other.

Mesh Motion
lists the parameters that define motion for a moving reference frame.

Rotation-Axis Origin
specifies the origin for the axis of rotation of solid zone. See *Specifying the Rotation Axis* (p. 219) for details. This item will appear only for 3D and 2D non-axisymmetric models.

Rotation-Axis Direction
specifies the direction vector for the solid zone's axis of rotation. See *Specifying the Rotation Axis* (p. 219) for details. This item will appear only for 3D models.

Rotational Velocity
contains an input field for the rotational **Speed** of the zone.

Translational Velocity
contains inputs for the **X**, **Y**, and **Z** velocities of the zone.

Relative Specification
indicates whether the velocities are absolute velocities (**absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UDF
allows you to hook the DEFINE_ZONE_MOTION UDF.

Copy to Frame Motion
allows you to switch between the MRF and moving mesh models. The variables used for the origin, axis, and velocity components, as well as for the UDF `DEFINE_ZONE_MOTION` will be copied from one model to the other.

Source Term
lists the parameters for volumetric source of energy.

Energy
displays the total number of energy sources used.

User Scalar n
displays the total number of scalars used.

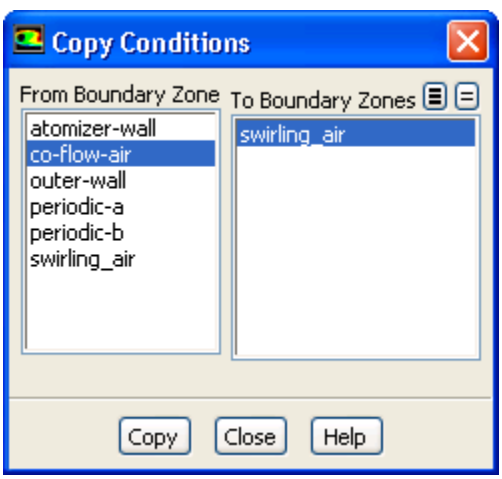
Fixed Values
lists the parameters that can be declared as fixed during the calculation.

Temperature
specifies the fixed value for temperature.

User Scalar n
specifies the fixed value for user scalar.

35.6.3. Copy Conditions Dialog Box

The **Copy Conditions** dialog box allows you to copy cell zone and/or boundary conditions from one zone/boundary to other zones/boundaries of the same type. It is opened either from the *Cell Zone Conditions Task Page* (p. 1794) or from the *Boundary Conditions Task Page* (p. 1812). See *Copying Cell Zone and Boundary Conditions* (p. 208) for details.



Controls

From Zone
specifies the zone that has the conditions you want to copy.

To Zones
specifies the zone or zones to which you want to copy the conditions.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Phase

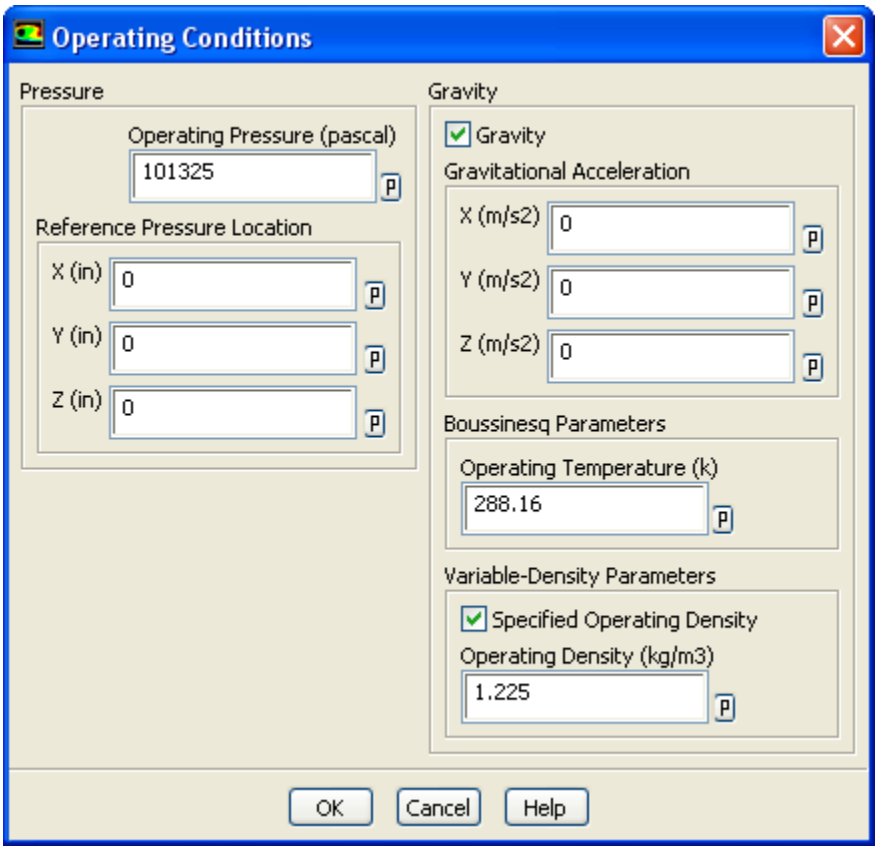
specifies the phase for which cell zone conditions or boundary conditions are being copied. This item appears if the VOF, mixture, or Eulerian multiphase model is being used. See *Steps for Copying Cell Zone and Boundary Conditions* (p. 1119) for details.

Copy

copies the cell zone conditions or boundary conditions, setting all of the conditions for the zones selected in the **To Zones** list to be the same as the conditions for the zone selected in the **From Zone** list.

35.6.4. Operating Conditions Dialog Box

The **Operating Conditions** dialog box allows you to set parameters related to operating conditions in your model.



Controls

Pressure

contains items related to the modeling of pressure.

Floating Operating Pressure

specifies the use of a floating operating pressure. See *Floating Operating Pressure* (p. 507) for details. This option appears only for time-dependent compressible flows.

Operating Pressure

sets the operating pressure for the problem. For all flows, ANSYS FLUENT uses gauge pressure internally. Any time an absolute pressure is needed, it is generated by adding the operating pressure to the relative pressure. See *Operating Pressure* (p. 449) for a detailed description of operating pressure and how to set it.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reference Pressure Location
sets the location of the cell whose pressure value is used to adjust the gauge pressure field for incompressible flows that do not involve any pressure boundaries. See *Reference Pressure Location* (p. 450) for details.

Gravity
contains inputs for gravitational acceleration, the Boussinesq model, and variable density.

Gravity
enables the specification of gravity.

Gravitational Acceleration
sets the x, y, and z components of the gravitational acceleration vector. (The z component is available only in 3D solvers.) See *Natural Convection and Buoyancy-Driven Flows* (p. 697) for details about buoyancy-driven flows. This option appears only when **Gravity** is enabled.

Boussinesq Parameters
contains inputs related to the Boussinesq model. This option appears only if **Energy** (in the *Energy Dialog Box* (p. 1645)) and **Gravity** are enabled. See *The Boussinesq Model* (p. 697) for more information on the Boussinesq model.

Operating Temperature
sets the operating temperature (T_0 in *Equation 14–2* (p. 697)) for use with the Boussinesq approximation.

Variable-Density Parameters
contains inputs related to the modeling of variable density. This option appears only when **Gravity** is enabled.

Specified Operating Density
enables the specification of operating density. See *Operating Density* (p. 700) for details.

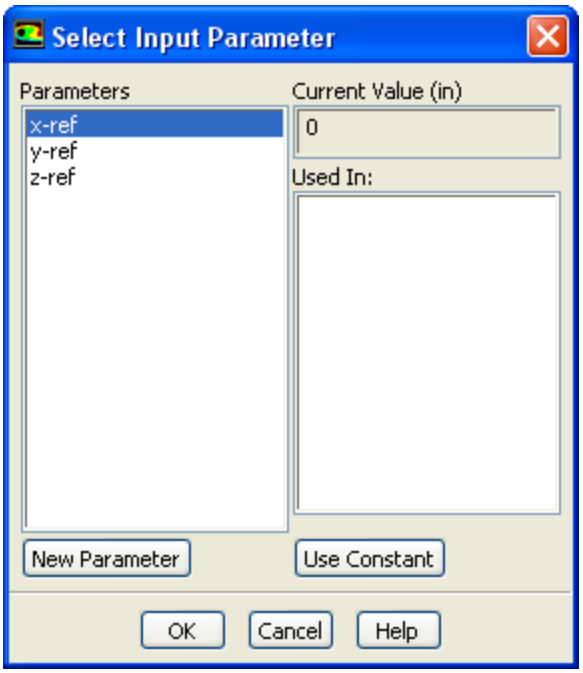
Operating Density
sets the operating density (ρ_0 in *Equation 14–3* (p. 700)). This parameter can be set only when **Specified Operating Density** is enabled.

These quantities can be assigned to an input parameter (indicated by the small "p" icon next to the field). Clicking this icon displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters.

35.6.5. Select Input Parameter Dialog Box

The **Select Input Parameter** dialog box allows you to choose from a listing of existing input parameters as well as to create and define new input parameters. For more information about parameters, see *Defining and Viewing Parameters* (p. 210) in the User's Guide, and see Working With Input and Output Parameters in Workbench in the ANSYS FLUENT in Workbench User's Guide.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Parameters
contains a list of existing compatible input parameters

Current Value
displays the value of the currently selected parameter.

Used In
lists any variables that are already associated with the currently selected parameter.

Use Constant
allows you to change the associated parameter to a constant (i.e., real) value.

New Parameter
opens the *Input Parameter Properties Dialog Box* (p. 2043), in which you can assign names and values to an input parameter.

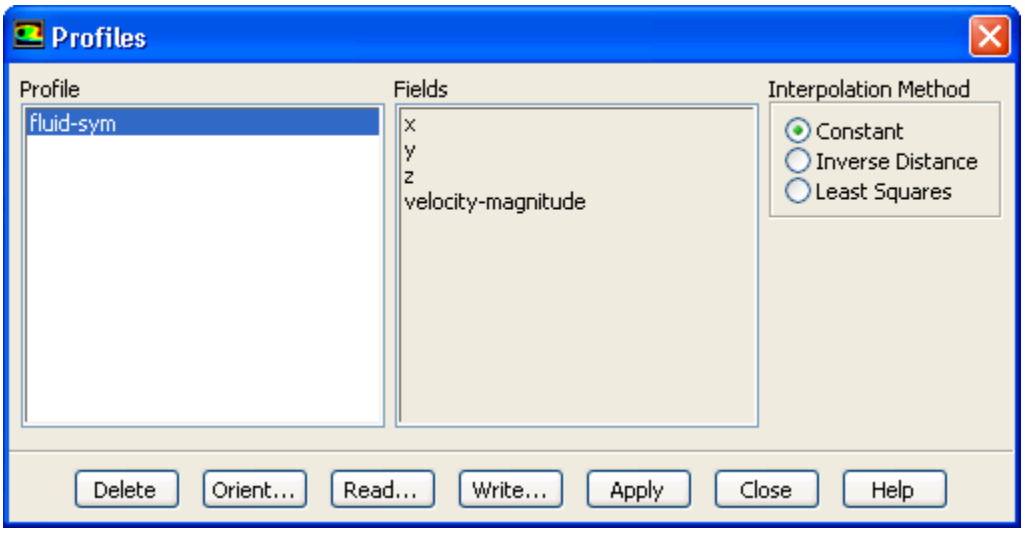
Note

Source term parameters can only be specified using SI units. The default parameter name will not include the unit quantity name. Even if you have selected units other than SI for the source term parameters, you must still provide values assuming SI units for the (source-term) parameters in *both* FLUENT and Workbench.

35.6.6. Profiles Dialog Box

The **Profiles** dialog box allows you to define new profiles by reading cell zone and boundary profile files. You can also examine the existing profile definitions and delete unused profiles. See *Profiles* (p. 366) for details about cell zone and boundary profiles.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Profile

contains a selectable list of available profiles. When a profile is selected its available fields are displayed under **Fields**.

Fields

displays the fields available in the selected profile. After the profile file has been read, these fields will also appear in any boundary condition dialog box (e.g., the **Velocity Inlet** dialog box) that allows profile specification of a variable. To the right of (or below) the variable in the boundary conditions dialog box, there will be a drop-down list that contains a **constant** and the fields from available profile files. To use a particular profile field, just select it from the list.

Interpolation Method

allows you to select the interpolation method for the profile selected from the **Profile** list. This selection is only available for point profiles, and will only take effect when the **Apply** button is clicked. The choices include the following:

Constant

specifies that ANSYS FLUENT should use zeroth-order interpolation to assign the point profile values to the nearest cell faces at the boundary. This is the default selection.

Inverse Distance

specifies that ANSYS FLUENT should assign a value to each cell face at the boundary based on weighted contributions from the values in the point profile file. The weighting factor is inversely proportional to the distance between the profile point and the cell face center.

Least Squares

specifies that ANSYS FLUENT should assign values to the cell faces at the boundary through a first-order interpolation method that tries to minimizes the sum of the squares of the offsets (residuals) between the profile data points and the cell face centers.

Delete

deletes the selected profile from memory.

Orient...

opens the *Orient Profile Dialog Box* (p. 1810), in which you can reorient and scale the profile. This item appears only in 3D.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Read...

opens *The **Select File** Dialog Box* (p. 33) so that you can read a boundary profile file. If a profile in the file has the same name as an existing profile, the old profile will be overwritten.

Write...

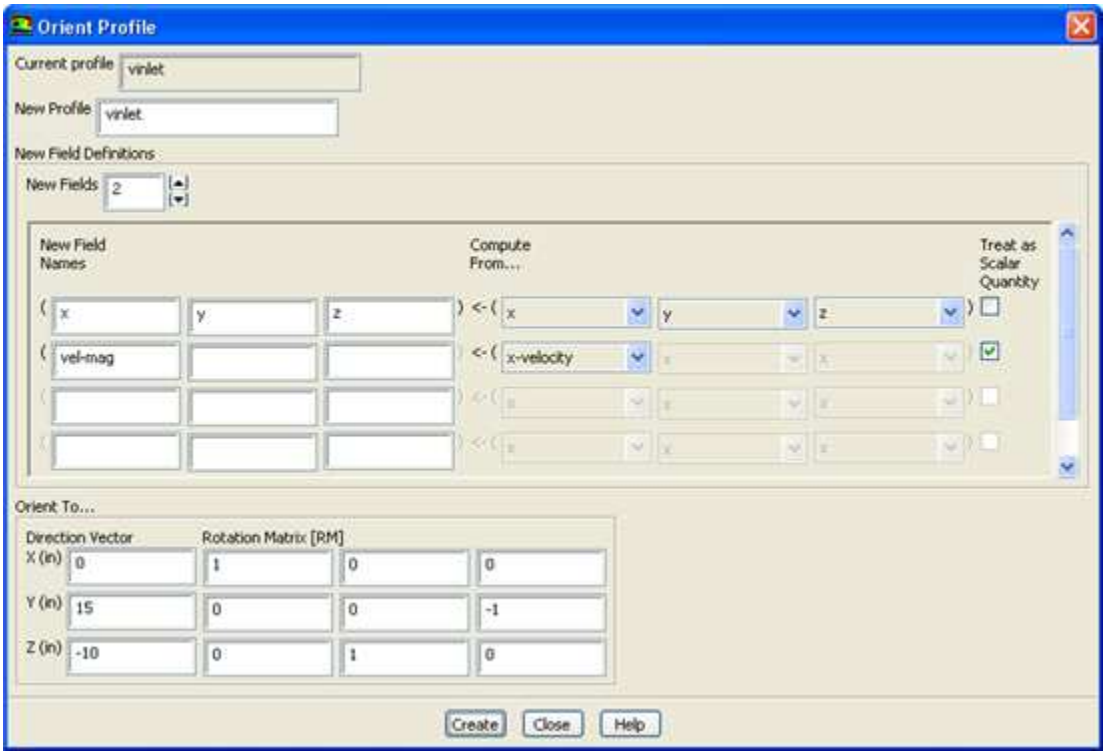
opens the *Write Profile Dialog Box* (p. 1811), in which you can save profile data.

Apply

sets the selection made in the **Interpolation Method** list for point profiles in preparation for interpolation. The profile is not actually interpolated until a profile field is selected in a boundary condition dialog box (e.g., the **Velocity Inlet** dialog box) and the solution is initialized.

35.6.7. Orient Profile Dialog Box

The **Orient Profile** dialog box allows you to reorient a profile so that you can apply it to a particular boundary. See *Reorienting Profiles* (p. 371) for details.



Controls

Current profile

shows the name of the currently selected profile in the *Profiles Dialog Box* (p. 1808). This is the profile on which the new profile will be based.

New Profile

sets the name of the new cell zone or boundary profile.

New Field Definitions

contains inputs and controls for the definition of the vector and scalar fields in the new profile.

New Fields

sets the number of data fields in the new profile.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

New Field Names

contains inputs for the names of the data fields in the new profile. For a vector field, all 3 inputs in each row will be active; for a scalar field, only the first will be active.

Compute From...

contains drop-down lists with the names of the fields in the **Current profile**. In these lists, select the fields from which the **New Field Names** will be computed.

Treat as Scalar Quantity

indicates (if on) that the adjacent field is a scalar quantity. If this option is off, the field is a vector quantity.

Orient To...

contains inputs for the definition of the local coordinate system for the new profile. This coordinate system will determine the orientation of the profile.

Direction Vector

is the vector that translates a cell zone or boundary profile to the new position, and is defined between the centers of the profile fields.

Rotation Matrix [RM

] specifies the rotational matrix RM which is based on Euler angles (γ, β, and α) that define an orthogonal system $x'y'z'$ as the result of the three successive rotations from the original system xyz. See *Reorienting Profiles* (p. 371) for more information.

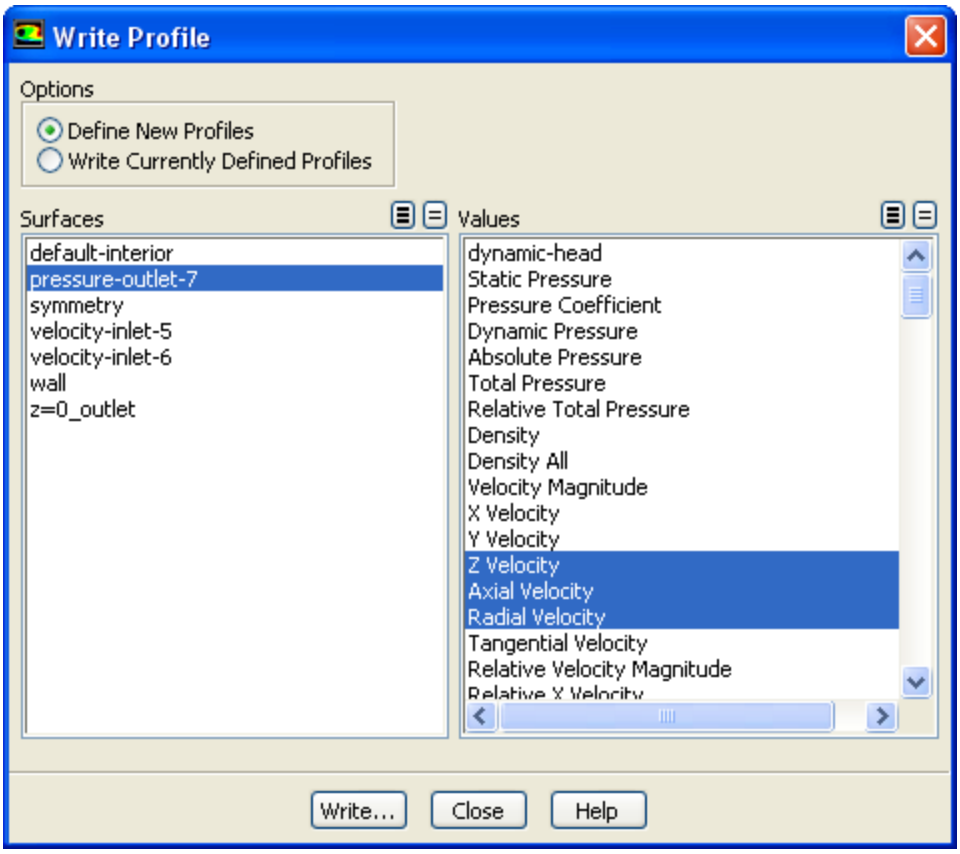
Create

creates a new profile using the information specified in the dialog box.

35.6.8. Write Profile Dialog Box

The **Write Profile** dialog box allows you to create a profile file from the conditions on a specified cell zone or boundary/surface. See *Writing Profile Files* (p. 71) for details on writing profile files.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains options for writing profiles.

Define New Profiles

enables the creation of a profile file from the conditions on a specified boundary or surface.

Write Currently Defined Profiles

enables the creation of a profile file containing all profiles that are currently defined.

Surfaces

contains a list from which you can select the surface(s) from which you want to extract data.

Values

contains a list from which you can select the variable(s) for which you want to create profiles.

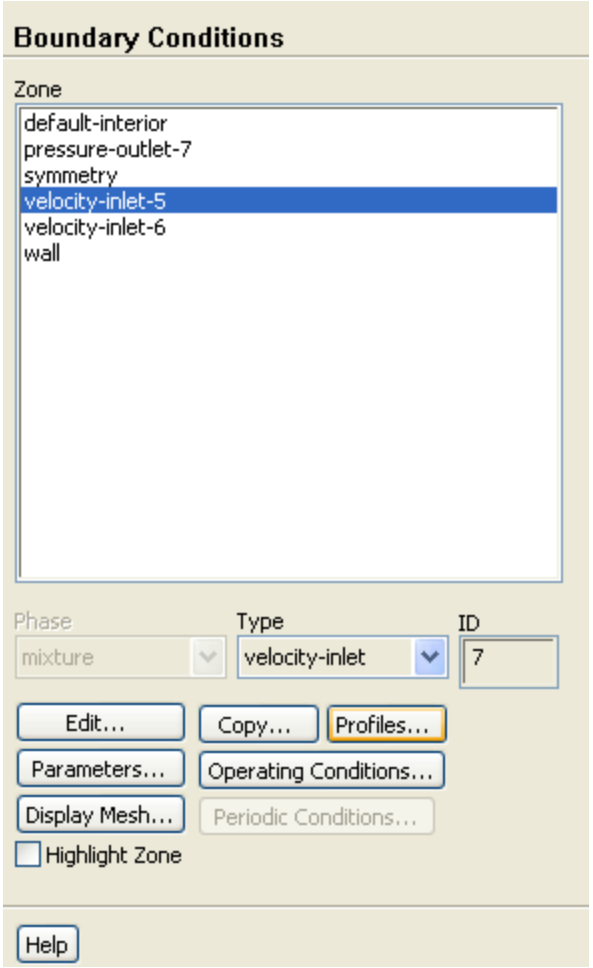
Write...

opens *The **Select File** Dialog Box* (p. 33), in which you can specify a filename for the profile file.

35.7. Boundary Conditions Task Page

The **Boundary Conditions** task page allows you to set the type of a boundary and display other dialog boxes to set the boundary condition parameters for each boundary.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone

contains a selectable list of boundary zones from which you can select the zone of interest. You can check a zone type by using the mouse probe (see *Controlling the Mouse Button Functions* (p. 1427)) on the displayed physical mesh. This feature is particularly handy if you are setting up a problem for the first time, or if you have two or more boundary zones of the same type and you want to determine the zone IDs. To do this you must first display the mesh with the *Mesh Display Dialog Box* (p. 1635). Then click the boundary zone with the right (select) mouse button. ANSYS FLUENT will print the zone ID and type of that boundary zone in the console window.

Phase

specifies the phase for which conditions at the selected boundary **Zone** are being set. This item appears if the VOF, mixture, or Eulerian multiphase model is being used. See *Defining Multiphase Cell Zone and Boundary Conditions* (p. 1107) for details.

Type

contains a drop-down list of boundary condition types for the selected zone. The list contains all possible types to which the zone can be changed.

Important

Note that you cannot use this method to change zone types to or from the periodic type, since additional restrictions exist for this boundary type. *Creating Conformal Periodic Zones* (p. 191) explains how to create and uncouple periodic zones.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ID
displays the zone ID number of the selected zone. (This is for informational purposes only; you cannot edit this number.)

Edit...
opens the appropriate dialog box for setting the boundary conditions for that particular boundary type.

Copy...
opens the *Copy Conditions Dialog Box* (p. 1805), which allows you to copy boundary conditions from one zone to other zones of the same type. See *Copying Cell Zone and Boundary Conditions* (p. 208) for details.

Profiles...
opens the *Profiles Dialog Box* (p. 1808).

Parameters...
opens the *Parameters Dialog Box* (p. 2041).

Operating Conditions...
opens the *Operating Conditions Dialog Box* (p. 1806).

Display Mesh...
opens the *Mesh Display Dialog Box* (p. 1635).

Periodic Conditions...
opens the *Periodic Conditions Dialog Box* (p. 1874).

Highlight Zone
when enabled highlights the boundary zone (selected in the task page) in the graphics window.

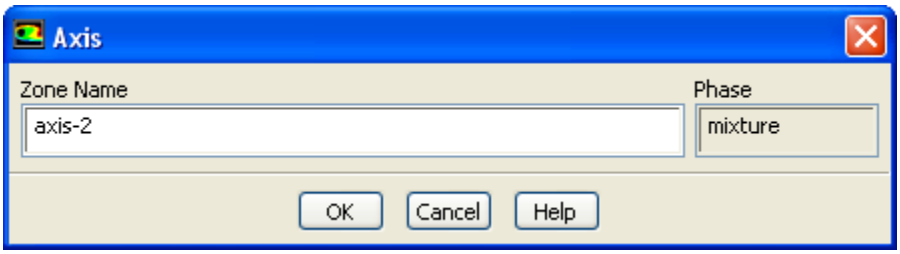
For additional information, please see the following sections:

35.7.1. Axis Dialog Box
35.7.2. Exhaust Fan Dialog Box
35.7.3. Fan Dialog Box
35.7.4. Inlet Vent Dialog Box
35.7.5. Intake Fan Dialog Box
35.7.6. Interface Dialog Box
35.7.7. Interior Dialog Box
35.7.8. Mass-Flow Inlet Dialog Box
35.7.9. Outflow Dialog Box
35.7.10. Outlet Vent Dialog Box
35.7.11. Periodic Dialog Box
35.7.12. Porous Jump Dialog Box
35.7.13. Pressure Far-Field Dialog Box
35.7.14. Pressure Inlet Dialog Box
35.7.15. Pressure Outlet Dialog Box
35.7.16. Radiator Dialog Box
35.7.17. RANS/LES Interface Dialog Box
35.7.18. Symmetry Dialog Box
35.7.19. Velocity Inlet Dialog Box
35.7.20. Wall Dialog Box
35.7.21. Periodic Conditions Dialog Box

35.7.1. Axis Dialog Box

The **Axis** dialog box can be used to modify the name of an axis zone; there are no conditions to be set. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Axis Boundary Conditions* (p. 323) for information about axis boundaries.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



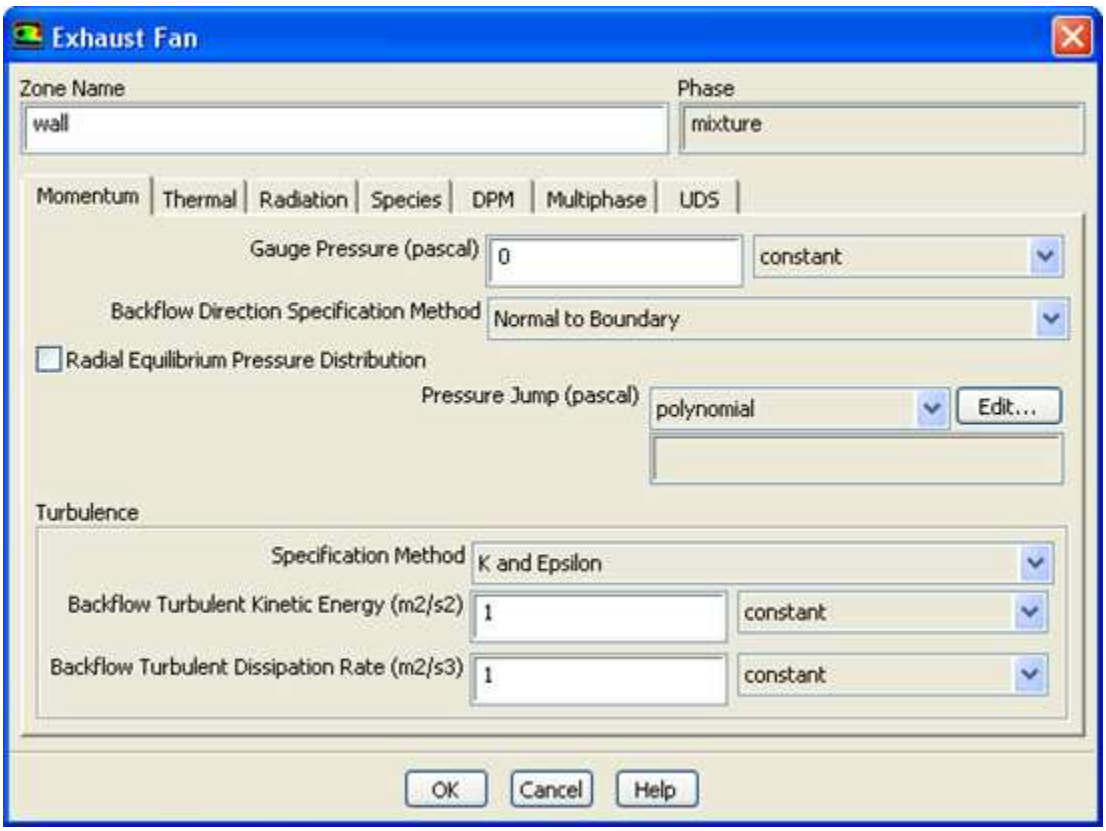
Controls

Zone Name
sets the name of the zone.

Phase
displays the name of the phase. This item appears if the VOF, mixture, or Eulerian multiphase model is being used.

35.7.2. Exhaust Fan Dialog Box

The **Exhaust Fan** dialog box sets the boundary conditions for an exhaust fan zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs at Exhaust Fan Boundaries* (p. 299) for details about defining the items below.



Controls

Zone Name
sets the name of the zone.

Phase
displays the name of the phase. It appears only for multiphase flows.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Momentum

contains the momentum parameters.

Gauge Pressure

sets the gauge pressure at the outlet boundary.

Backflow Direction Specification Method

sets the direction of the inflow stream should the flow reverse direction. You can choose **Direction Vector**, **Normal to Boundary**,or **From Neighboring Cell**.

Coordinate System

contains a drop-down list for selecting the coordinate system. You can choose **Cartesian**, **Cylindrical**, or **Local Cylindrical**. This option is available only for **Direction Vector**.

X, Y, Z-Component of Flow Direction

allows you to specify the velocity components in x, y, and z directions respectively. This option is available for cartesian coordinate system.

Radial Equilibrium Pressure Distribution

enables the radial equilibrium pressure distribution. See *Defining Static Pressure* (p. 283) for details.

This item appears only for 3D and axisymmetric swirl solvers.

Pressure Jump

specifies the rise in pressure across the fan. See *Specifying the Pressure Jump* (p. 299) for details.

Target Mass Flow Rate

allows you to set mass flow rate as a boundary condition at the outlet.

Turbulence

displays the turbulence parameters.

Specification Method

specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See *Determining Turbulence Parameters* (p. 250) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Backflow Turbulent Kinetic Energy, Backflow Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Backflow Turbulent Kinetic Energy, Backflow Specification Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t/μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Backflow Turbulent Viscosity Ratio

sets the value of the backflow turbulent viscosity ratio μ_t/μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the backflow Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulence Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS FLUENT will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See *Reynolds Stress Model* (p. 679) for details. (This item will appear only for RSM turbulent flow calculations.)

Backflow UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the backflow Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Thermal

contains the thermal parameters. This parameter is available only when the energy equation is turned on.

Backflow Total Temperature

sets the total temperature of the inflow stream should the flow reverse direction.

Radiation

contains the boundary conditions for the radiation model at the exhaust fan.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 724) for details.

Participates in Solar Ray Tracing

specifies whether or not the fan participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the fan.

Participates in View Factor Calculation

specifies whether or not the fan participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Species Mass Fractions

contains inputs for the mass fractions of defined species. See *Defining Cell Zone and Boundary Conditions for Species* (p. 822) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Backflow Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See *Setting Boundary Conditions for the Progress Variable* (p. 899) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM

contains the discrete phase parameters. This tab is available only if you have defined at least one injection.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film

consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Multiphase

contains the multiphase parameters.

Backflow Granular Temperature

specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Backflow Volume Fraction

specifies the volume fraction of the secondary phase selected in the *Boundary Conditions Task Page* (p. 1812). This section of the dialog box will appear when one of the multiphase models is being used. See *Defining Multiphase Cell Zone and Boundary Conditions* (p. 1107) for details.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user defines scalars are specified.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

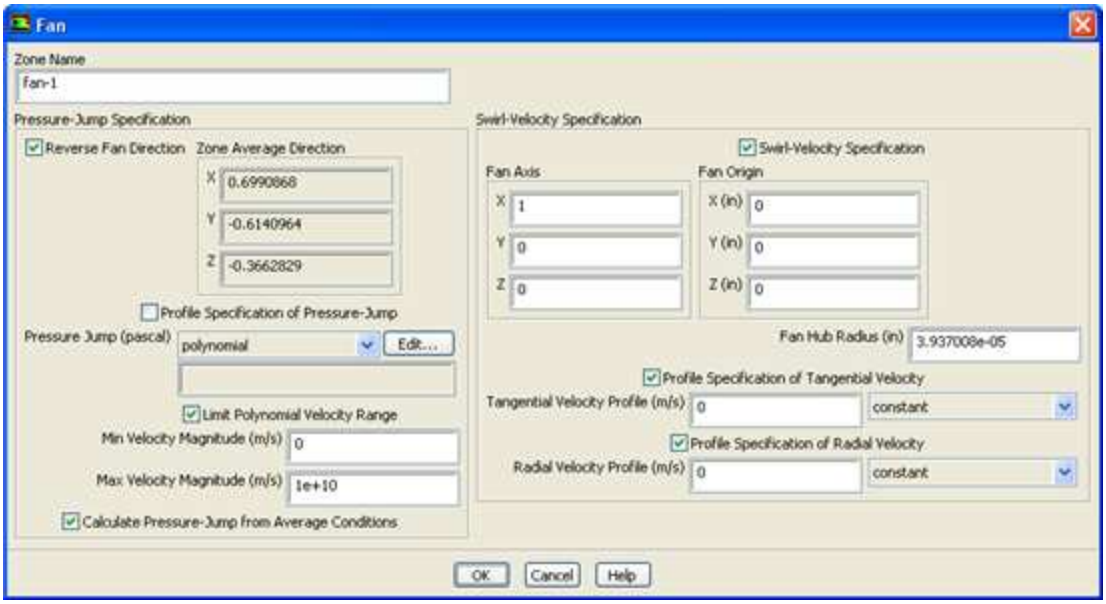
User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

35.7.3. Fan Dialog Box

The **Fan** dialog box sets the boundary conditions for a fan zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *User Inputs for Fans* (p. 325) for details about the items below.



Controls

Zone Name
sets the name of the zone.

Pressure-Jump Specification
contains inputs that define the pressure jump across the fan.

Reverse Fan Direction
sets the fan flow direction relative to the zone direction. If **Zone Average Direction** is pointing in the direction you want the fan to blow, do *not* select **Reverse Flow**; if it is pointing in the opposite direction, select **Reverse Flow**.

Zone Average Direction
displays the (face-averaged) direction vector for the zone as an aid in determining whether or not you want to select **Reverse Flow**.

Profile Specification of Pressure-Jump
enables the use of a boundary profile or user-defined function for the pressure jump specification. See *Profiles* (p. 366) or the UDF Manual for details. When this option is enabled, **Pressure Jump Profile** will appear in the dialog box and the next four items below it will not.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Pressure Jump Profile
contains a drop-down list from which you can select a boundary profile or a user-defined function for the pressure jump definition. This item will appear if you enable **Profile Specification of Pressure-Jump**.

Pressure-Jump
specifies the pressure-jump as a constant value or as a polynomial, piecewise-linear, or piecewise-polynomial function of velocity. See *Defining the Pressure Jump* (p. 326) for details.

Limit Polynomial Velocity Range
limits the minimum and maximum velocity magnitudes used to calculate the pressure jump when it is defined as a function of velocity.

Min Velocity Magnitude, Max Velocity Magnitude
specify the minimum and maximum values to which the velocity magnitude is limited (when the **Limit Polynomial Velocity Range** option is enabled).

Calculate Pressure-Jump from Average Conditions
enables the option to use the mass-averaged velocity normal to the fan to determine a single pressure-jump value for all faces in the fan zone.

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

interior
allows the particles to pass through the boundary.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap
terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape
reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

Swirl-Velocity Specification
contains inputs for the specification of fan swirl velocity. This section of the dialog box appears only for 3D models.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Swirl-Velocity Specification
enables the specification of a swirl velocity for the fan.

Fan Axis
sets the direction vector for the fan's axis of rotation.

Fan Origin
sets the origin in the global coordinate system through which the fan rotation axis passes.

Fan Hub Radius
set the radius of the hub. The default is 1e-6 to avoid division by zero in the polynomial.

Profile Specification of Tangential Velocity
enables the use of a boundary profile or user-defined function for the tangential velocity specification. See *Profiles* (p. 366) or the UDF Manual for details. When this option is enabled, **Tangential Velocity Profile** will appear in the dialog box and **Tangential-Velocity Polynomial Coefficients** will not.

Tangential Velocity Profile
contains a drop-down list from which you can select a boundary profile or a user-defined function for the definition of the tangential velocity. This item will appear if you enable **Profile Specification of Tangential Velocity**.

Tangential-Velocity Polynomial Coefficients
sets the coefficients for the tangential velocity polynomial. Separate the coefficients by spaces.

Profile Specification of Radial Velocity
enables the use of a boundary profile or user-defined function for the radial velocity specification. See *Profiles* (p. 366) or the UDF Manual for details. When this option is enabled, **Radial Velocity Profile** will appear in the dialog box and **Radial-Velocity Polynomial Coefficients** will not.

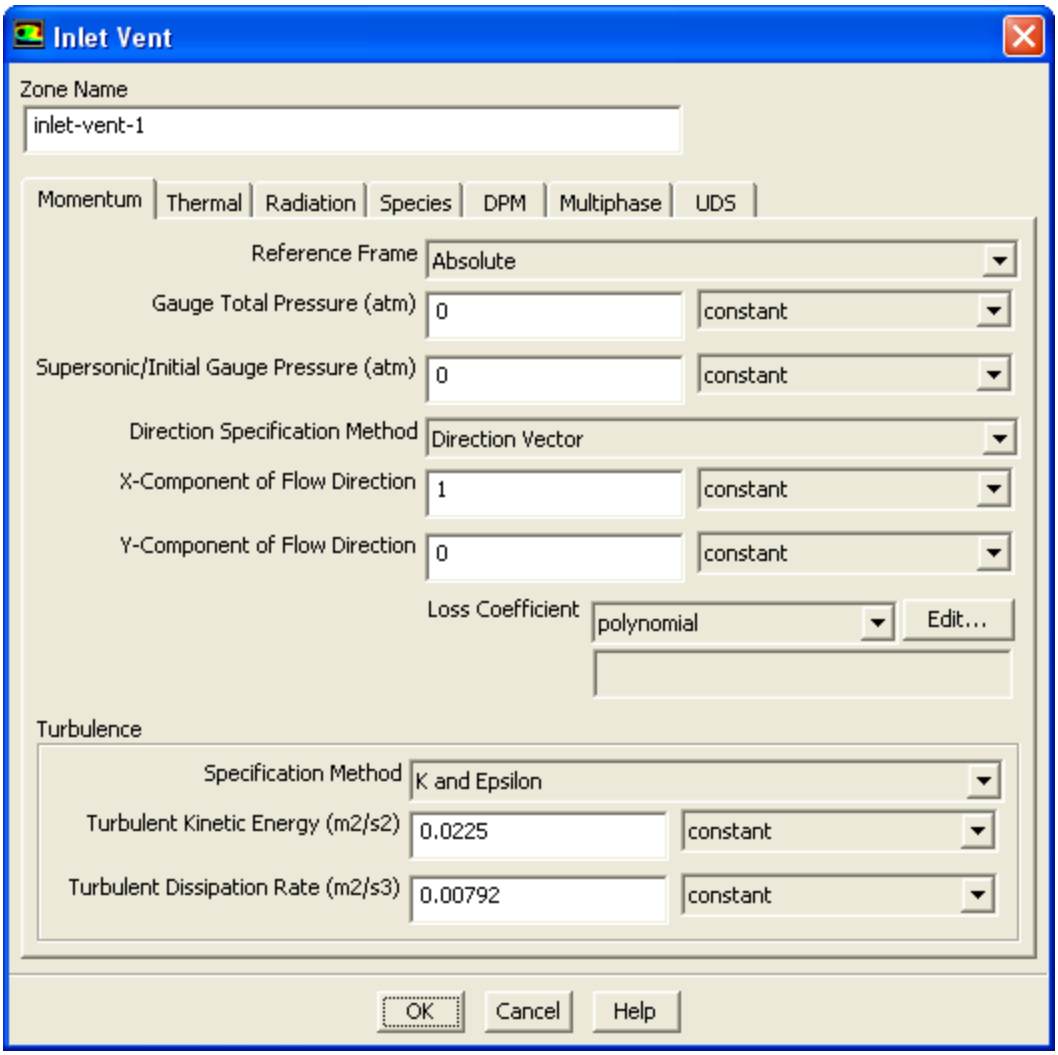
Radial Velocity Profile
contains a drop-down list from which you can select a boundary profile or a user-defined function for the definition of the radial velocity. This item will appear if you enable **Profile Specification of Radial Velocity**.

Radial-Velocity Polynomial Coefficients
sets the coefficients for the radial velocity polynomial. Separate the coefficients by spaces.

35.7.4. Inlet Vent Dialog Box

The **Inlet Vent** dialog box sets the boundary conditions for an inlet vent zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs at Inlet Vent Boundaries* (p. 278) for details about defining the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.

Reference Frame

specifies the reference frame for the mass flow. If the cell zone adjacent to the mass-flow inlet is moving, you can choose to specify relative or absolute velocities by selecting **Relative to Adjacent Cell Zone** or **Absolute** in the **Reference Frame** drop-down list.

Gauge Total Pressure

sets the gauge total (or stagnation) pressure of the inflow stream. If you are using moving reference frames, see *Defining Total Pressure and Temperature* (p. 257) for information about relative and absolute total pressure.

Supersonic/Initial Gauge Pressure

sets the static pressure on the boundary when the flow becomes (locally) supersonic. It is also used to compute initial values for pressure, temperature, and velocity if the inlet vent boundary condition is selected for computing initial values (see *Initializing the Entire Flow Field Using Standard Initialization* (p. 1240)).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Direction Specification Method

specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** no inputs are required. See *Defining the Flow Direction* (p. 259) for information on specifying flow direction.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**, **Local Cylindrical Swirl** vector components will be input. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

X,Y,Z-Component of Flow Direction

set the direction of the flow at the inlet boundary. These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial, Tangential, Axial Component of Flow Direction

set the direction of the flow at the inlet boundary. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

X,Y,Z-Component of Axis Direction

sets the direction of the axis. These items will appear if the selected **Coordinate System** is **Local Cylindrical**.

X,Y,Z-Coordinate of Axis Origin

sets the location of the axis origin. These items will appear if the selected **Coordinate System** is **Local Cylindrical**.

Loss-Coefficient

sets the non-dimensional loss coefficient used to compute the pressure drop. See *Specifying the Loss Coefficient* (p. 279)for details.

Turbulence

lists the turbulence parameters.

Specification Method

specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See *Determining Turbulence Parameters* (p. 250) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulence Intensity, Turbulence Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Turbulence Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t/μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulence Intensity, Hydraulic Diameter
set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Turbulent Viscosity Ratio
sets the value of the turbulent viscosity ratio μ_t/μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method
specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulence Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS FLUENT will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See *Reynolds Stress Model* (p. 679) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses
specify the Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Thermal
contains the thermal parameters.

Total Temperature
sets the total temperature of the inflow stream. If you are using moving reference frames, see *Defining Total Pressure and Temperature* (p. 257) for information about relative and absolute total temperature.

Radiation
contains the radiation parameters.

External Black Body Temperature Method, Internal Emissivity
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 724) for details.

Participates in Solar Ray Tracing
specifies whether or not the inlet vent participates in solar ray tracing.

Solar Transmissivity Factor
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the inlet vent.

Participates in View Factor Calculation
specifies whether or not the inlet vent participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species
contains the species parameters.

Specify Species in Mole Fractions
allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions
contains inputs for the mass fractions of defined species. See *Defining Cell Zone and Boundary Conditions for Species* (p. 822) for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mean Mixture Fraction, Mixture Fraction Variance
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable
sets the value of the progress variable for premixed turbulent combustion. See *Setting Boundary Conditions for the Progress Variable* (p. 899) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM
contains the discrete phase parameters.

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap
terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape
reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

Multiphase
contains the multiphase parameters.

Granular Temperature
specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Volume Fraction
specifies the volume fraction of the secondary phase selected in the *Boundary Conditions Task Page* (p. 1812). This section of the dialog box will appear when one of the multiphase models is being used. See *Defining Multiphase Cell Zone and Boundary Conditions* (p. 1107) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Open Channel
is available when the VOF model with open channel flow is enabled.

Secondary Phase for Inlet
is where the specified parameters are valid only for one secondary phase. In case of a three-phase flow, select the corresponding secondary phase from this list. This appears when **Open Channel** is enabled.

Flow Specification Method
allows you to select the type of flow. You can choose **Free Surface Level and Velocity**, **Total Height and Velocity**, or **Free Surface Level and Total Height**. This appears when **Open Channel** is enabled.

Free Surface Level
can be determined using the absolute value of height from the free surface to the origin in the direction of gravity, or by applying the correct sign based on whether the free surface level is above or below the origin.

Total Height
is used as an option for describing the flow. It is given by *Equation 26–3* (p. 1124).

Bottom Level
is valid only for shallow waves. The bottom level is used for calculating the liquid height.

Velocity Magnitude
sets the magnitude of the velocity vector at the inflow boundary.

Level-Set Function Flux
appears if the **Level Set** option is enabled for the VOF model.

UDS
contains the UDS parameters.

User-Defined Scalar Boundary Condition
appears only if user defines scalars are specified.

User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

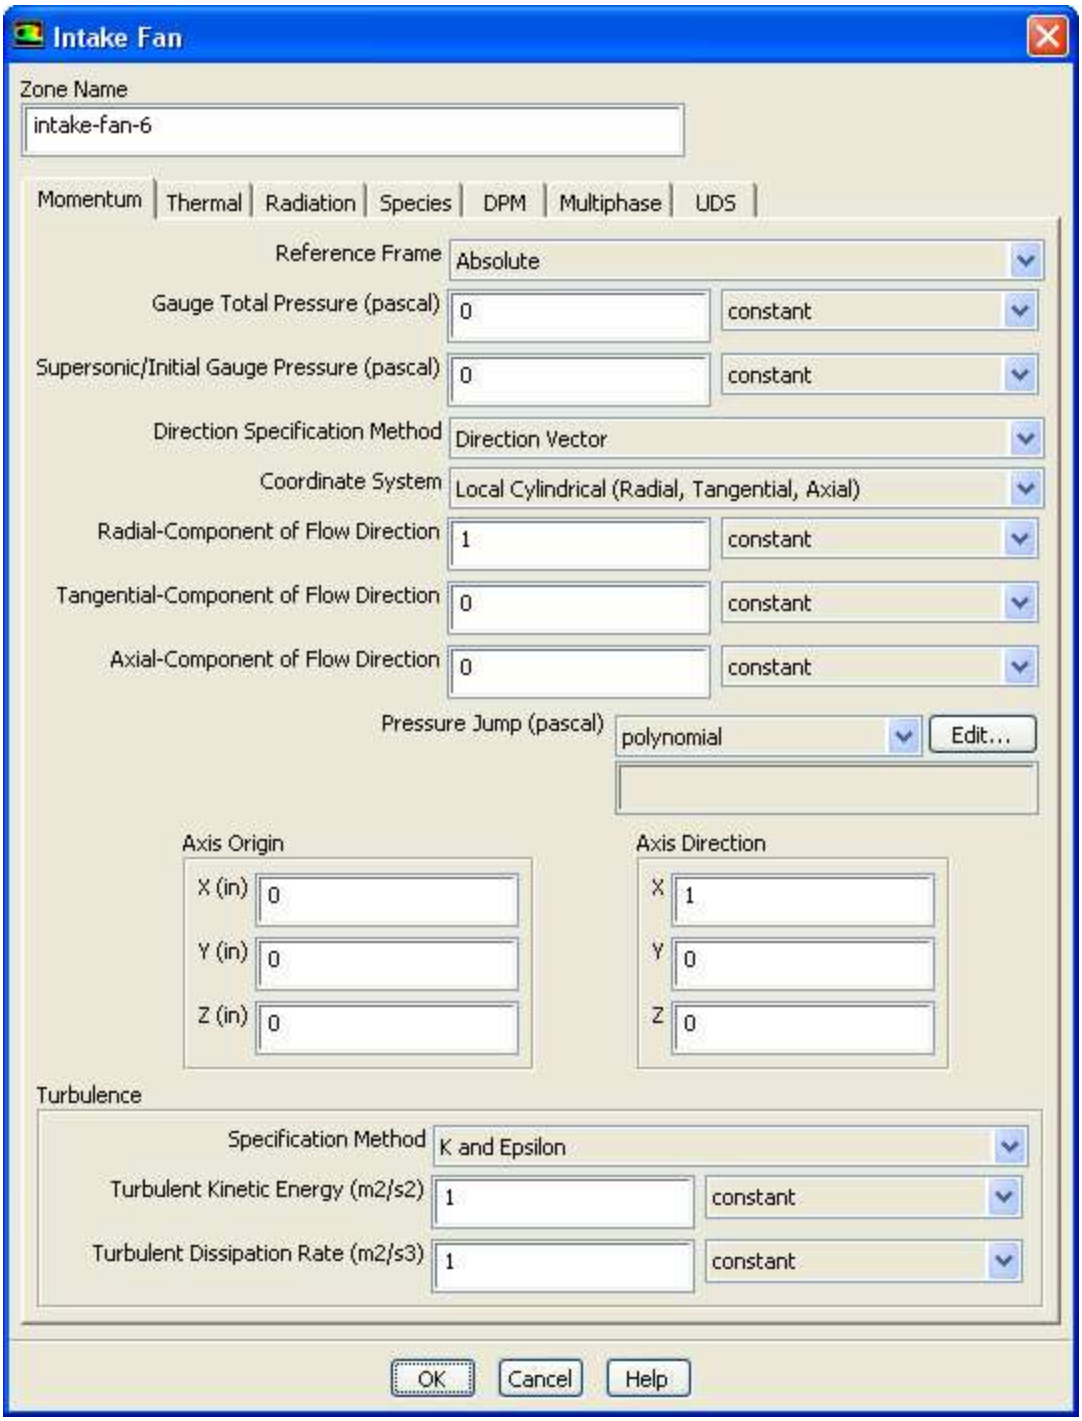
User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

35.7.5. Intake Fan Dialog Box

The **Intake Fan** dialog box sets the boundary conditions for an intake fan zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs at Intake Fan Boundaries* (p. 280) for details about defining the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.

Reference Frame

specifies the reference frame for the mass flow. If the cell zone adjacent to the mass-flow inlet is moving, you can choose to specify relative or absolute velocities by selecting **Relative to Adjacent Cell Zone** or **Absolute** in the **Reference Frame** drop-down list.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Gauge Total Pressure

sets the gauge total (or stagnation) pressure of the inflow stream. If you are using moving reference frames, see *Defining Total Pressure and Temperature* (p. 257) for information about relative and absolute total pressure.

Supersonic/Initial Gauge Pressure

sets the static pressure on the boundary when the flow becomes (locally) supersonic. It is also used to compute initial values for pressure, temperature, and velocity if the intake fan boundary condition is selected for computing initial values (see *Initializing the Entire Flow Field Using Standard Initialization* (p. 1240)).

Direction Specification Method

specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** no inputs are required. See *Defining the Flow Direction* (p. 259) for information on specifying flow direction.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**,or **Local Cylindrical Swirl** vector components will be input. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

X,Y,Z-Component of Flow Direction

set the direction of the flow at the inlet boundary. For compressible flow, if the inflow becomes supersonic, the velocity is not reoriented. These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial, Tangential, Axial Component of Flow Direction

set the direction of the flow at the inlet boundary. For compressible flow, if the inflow becomes supersonic, the velocity is not reoriented. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Pressure-Jump

specifies the rise in pressure across the fan. See *Specifying the Pressure Jump* (p. 281) for details.

X,Y,Z-Coordinate of Axis Origin

sets the location of the axis origin. These items will appear if the selected **Coordinate System** is **Local Cylindrical**.

X,Y,Z-Component of Axis Direction

sets the direction of the axis. These items will appear if the selected **Coordinate System** is **Local Cylindrical**.

Turbulence

consists of the turbulence parameters.

Specification Method

specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See *Determining Turbulence Parameters* (p. 250) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulent Intensity, Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Turbulent Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t/μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Turbulent Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t/μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**.If you choose the former, ANSYS FLUENT will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See *Reynolds Stress Model* (p. 679) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the Reynolds stress components when **Reynolds-Stress Components**is chosen as the **Reynolds-Stress Specification Method**.

Thermal

contains the thermal parameters.

Total Temperature

sets the total temperature of the inflow stream. If you are using moving reference frames, see *Defining Total Pressure and Temperature* (p. 257) for information about relative and absolute total temperature.

Radiation

contains the radiation parameters.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 724) for details.

Participates in Solar Ray Tracing

specifies whether or not the intake fan participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the intake fan.

Participates in View Factor Calculation

specifies whether or not the intake fan participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions

contains inputs for the mass fractions of defined species. See *Defining Cell Zone and Boundary Conditions for Species* (p. 822) for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See *Setting Boundary Conditions for the Progress Variable* (p. 899) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap

terminates the trajectory calculations and records the fate of the particle as “trapped”. In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape

reports the particle as having “escaped” when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: "“Wall Jet” Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film

consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Multiphase

contains the multiphase parameters.

Granular Temperature

specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Volume Fraction

specifies the volume fraction of the secondary phase selected in the *Boundary Conditions Task Page* (p. 1812). This section of the dialog box will appear when one of the multiphase models is being used. See *Defining Multiphase Cell Zone and Boundary Conditions* (p. 1107) for details.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user defines scalars are specified.

User Scalar-n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

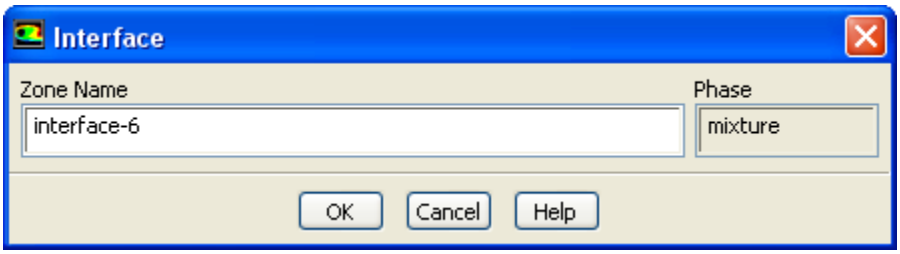
appears only if user defines scalars are specified.

User Scalar-n

specifies the value of the scalar.

35.7.6. Interface Dialog Box

The **Interface** dialog box can be used to modify the name of an interface zone; there are no conditions to be set. It is opened from the *Boundary Conditions Task Page* (p. 1812). Interface zones are used for multiple reference frame and sliding mesh calculations, and for non-conformal meshes. See *The Multiple Reference Frame Model* (p. 522), *Setting Up the Sliding Mesh Problem* (p. 541), and *Non-Conformal Meshes* (p. 161) for details.



Controls

Zone Name

sets the name of the zone.

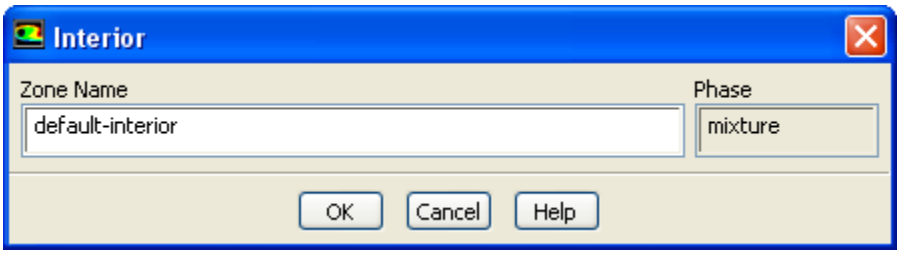
Phase

displays the name of the phase. This item appears only for multiphase flows.

35.7.7. Interior Dialog Box

The **Interior** dialog box can be used to modify the name of an interior zone; there are no conditions to be set. It is opened from the *Boundary Conditions Task Page* (p. 1812).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



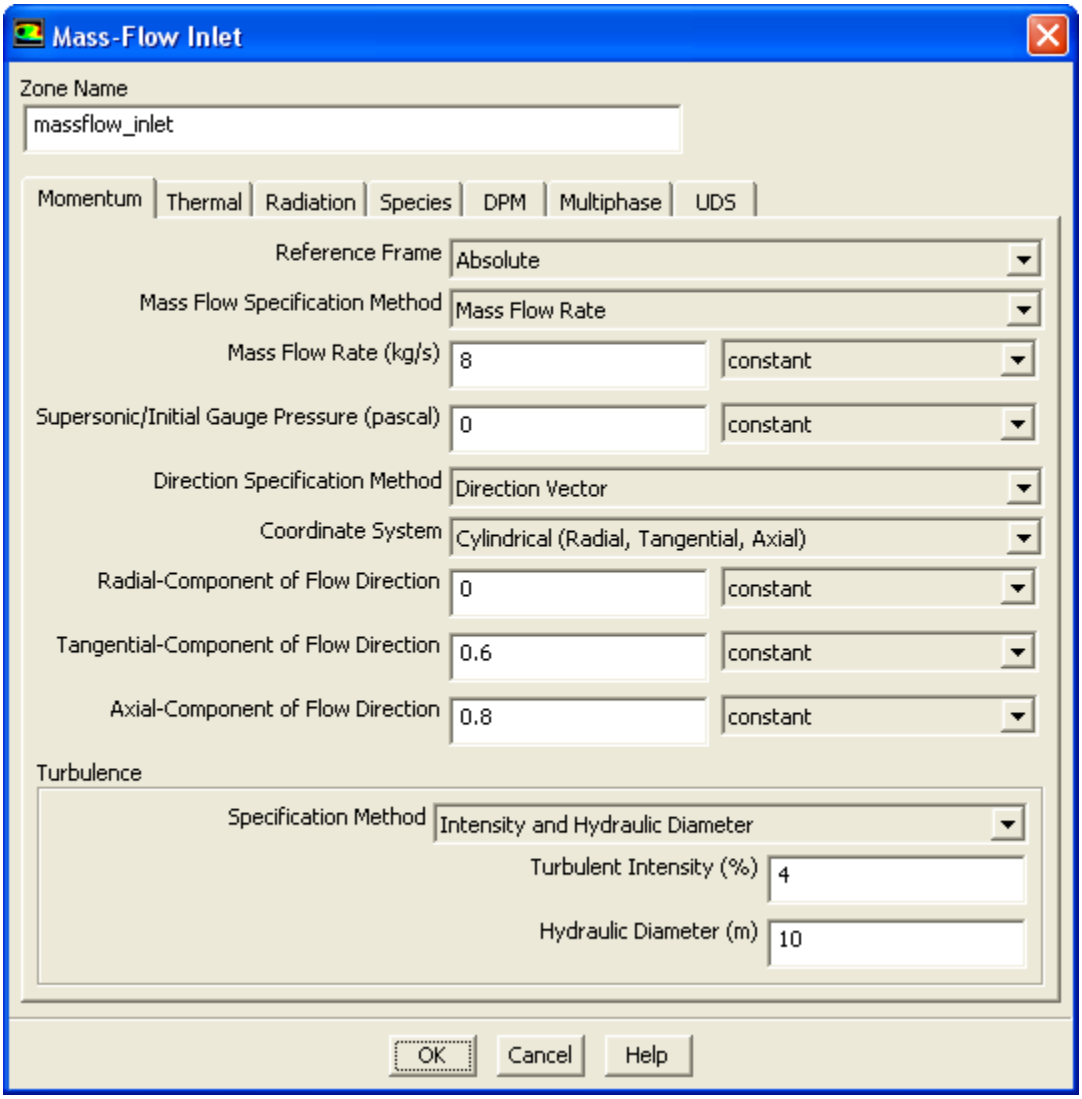
Controls

Zone Name
sets the name of the zone.

Phase
displays the name of the phase. This item appears only for multiphase flows.

35.7.8. Mass-Flow Inlet Dialog Box

The **Mass-Flow Inlet** dialog box sets the boundary conditions for a mass-flow inlet zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs at Mass Flow Inlet Boundaries* (p. 271) for details about defining the items below.



Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Zone Name
sets the name of the zone.

Momentum
displays the momentum boundary conditions.

Reference Frame
specifies the reference frame for the mass flow. If the cell zone adjacent to the mass-flow inlet is moving, you can choose to specify relative or absolute velocities by selecting **Relative to Adjacent Cell Zone** or **Absolute** in the **Reference Frame** drop-down list.

Mass Flow Specification Method
specifies whether you are defining **Mass Flow Rate**, **Mass Flux**, or **Mass Flux with Average Mass Flux**.

Mass Flow Rate
sets the prescribed mass flow rate for the zone. This flow rate is converted internally to a prescribed uniform mass flux over the zone by dividing the flow rate by the flow direction area projection of the zone. This item will appear if you selected **Mass Flow Rate** in the **Mass Flow Specification Method** list.

Important

Note that for axisymmetric problems, this mass flow rate is the flow rate through the entire (2π-radian) domain, not through a 1-radian slice.

Mass Flux
sets the prescribed mass flux for the zone. This item will appear if you selected **Mass Flux** or **Mass Flux with Average Mass Flux** in the **Mass Flow Specification Method** list.

Important

Note that for axisymmetric problems, this mass flux is the flux through a 1-radian slice of the domain.

Average Mass Flux
sets the average mass flux through the zone. See *More About Mass Flux and Average Mass Flux* (p. 273) for details. This item will appear if you selected **Mass Flux with Average Mass Flux** in the **Mass Flow Specification Method** list.

Important

Note that for axisymmetric problems, this mass flux is the flux through a 1-radian slice of the domain.

Supersonic/Initialization Gauge Pressure
sets the static pressure that will be used to initialize the flow field if the mass flow inlet boundary condition is selected for initializing flow properties (see *Initializing the Entire Flow Field Using Standard Initialization* (p. 1240)).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Direction Specification Method

specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** no inputs are required. See *Defining the Flow Direction* (p. 259) for information on specifying flow direction.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**,or **Local Cylindrical Swirl** vector components will be input. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

X,Y,Z-Component of Flow-Direction

set the velocity-direction vector of the inflow stream. This vector does not need to be normalized (e.g., you can specify the vector (1 1 1) rather than (0.577 0.577 0.577)). These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial-, Tangential-, Axial-Component of Flow Direction

set the velocity-direction vector of the inflow stream. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

Radial-, Axial-Component of Flow Direction and Tangential-Component of Velocity

appear for a 3D **Local Cylindrical Swirl** coordinate system. Specify the **X**, **Y**, and **Z-Component of Axis Direction** and the **X**, **Y**, and **Z-Coordinate of Axis Origin**.

Turbulence

contains the turbulence parameters.

Specification Method

specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See *Determining Turbulence Parameters* (p. 250) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulent Intensity, Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Turbulent Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t/μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Turbulent Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t/μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reynolds-Stress Specification Method
specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS FLUENT will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See *Reynolds Stress Model* (p. 679) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses
specify the Reynolds stress components when **Reynolds-Stress Components**is chosen as the **Reynolds-Stress Specification Method**.

Thermal
contains the thermal parameters.

Total Temperature
sets the total temperature of the inflow stream.

Radiation
contains the radiation parameters.

External Black Body Temperature Method, Internal Emissivity
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 724) for details.

Participates in Solar Ray Tracing
specifies whether or not the mass-flow inlet participates in solar ray tracing.

Solar Transmissivity Factor
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the mass-flow inlet.

Participates in View Factor Calculation
specifies whether or not the mass-flow inlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species
contains the species parameters.

Specify Species in Mole Fractions
allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions
contains inputs for the mass fractions of defined species. See *Defining Cell Zone and Boundary Conditions for Species* (p. 822) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Progress Variable
sets the value of the progress variable for premixed turbulent combustion. See *Setting Boundary Conditions for the Progress Variable* (p. 899) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

Mean Mixture Fraction, Mixture Fraction Variance
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

DPM
contains the discrete phase parameters.

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap
terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape
reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

UDS
contains the UDS parameters.

User-Defined Scalar Boundary Condition
appears only if user defines scalars are specified.

User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

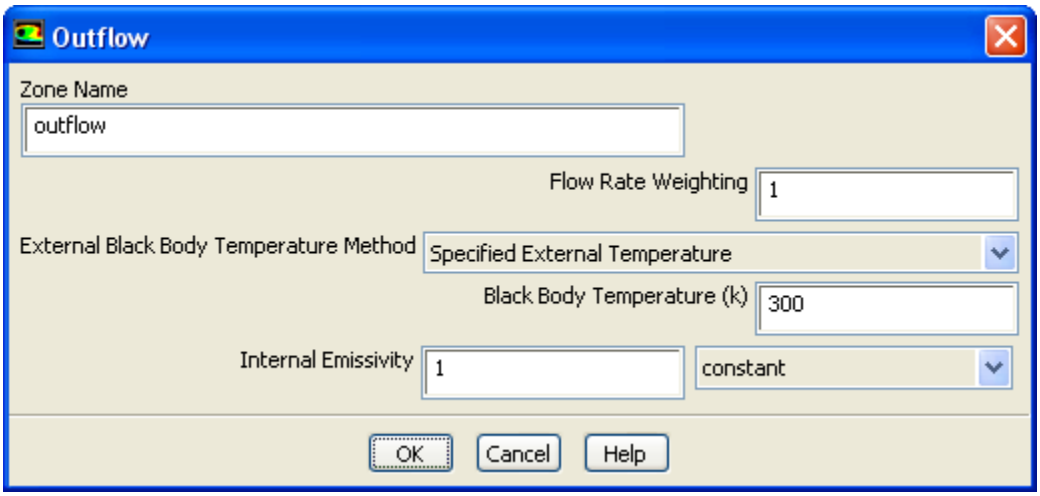
User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

35.7.9. Outflow Dialog Box

The **Outflow** dialog box sets the boundary conditions for an outflow zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Using Outflow Boundaries* (p. 294) for details about using outflow boundaries.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Flow Rate Weighting

specifies the portion of the outflow that is going through the boundary. See *Mass Flow Split Boundary Conditions* (p. 295) for details.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 724) for details.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film

consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Participates in Solar Ray Tracing
specifies whether or not outflow participate in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the outflow.

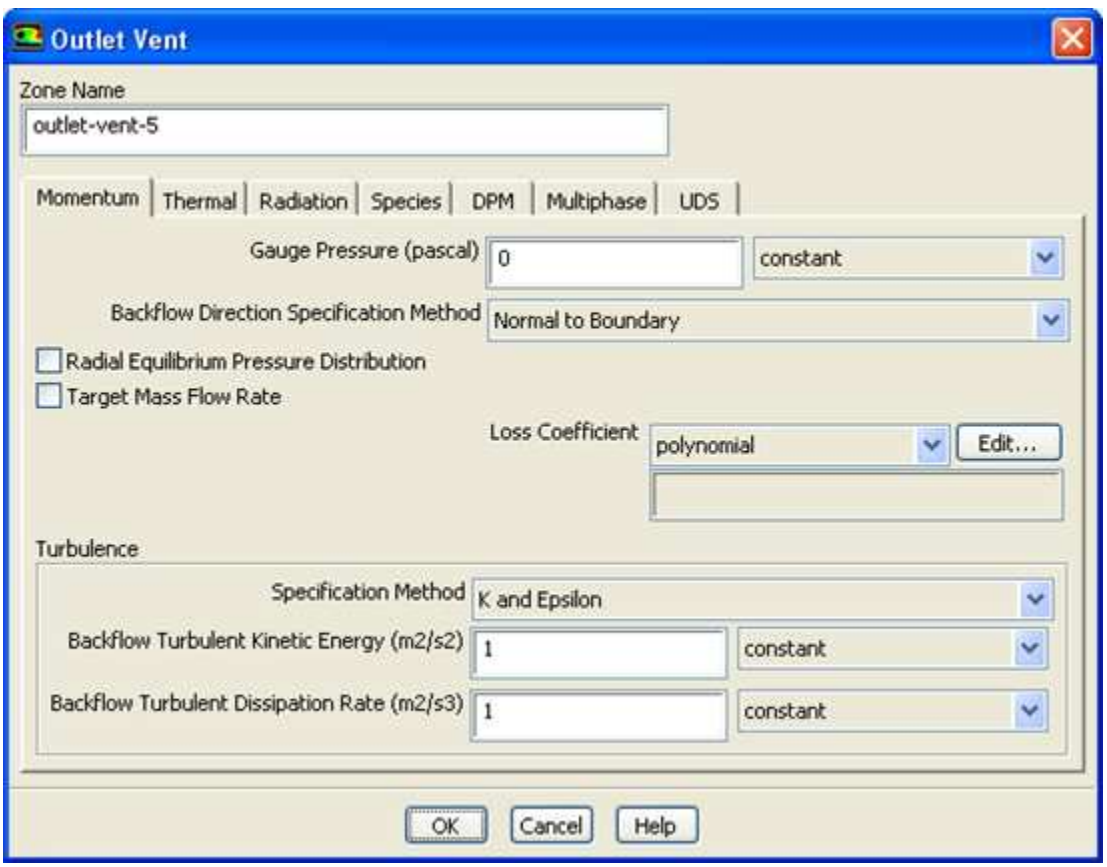
Discrete Phase BC Function
sets the user-defined function from the drop-down list.

Participates in View Factor Calculation

specifies whether or not the outflow participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

35.7.10. Outlet Vent Dialog Box

The **Outlet Vent** dialog box sets the boundary conditions for an outlet vent zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs at Outlet Vent Boundaries* (p. 297) for details about defining the items below.



Controls

Zone Name
sets the name of the zone.

Momentum
contains the momentum parameters.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Gauge Pressure
sets the gauge pressure at the outlet boundary.

Radial Equilibrium Pressure Distribution
enables the radial equilibrium pressure distribution. See *Defining Static Pressure* (p. 283) for details.

This item appears only for 3D and axisymmetric swirl solvers.

Backflow Direction Specification Method
specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** or **From Neighboring Cell** no inputs are required. See *Defining the Flow Direction* (p. 259) for information on specifying flow direction.

Target Mass Flow Rate
allows you to set mass flow rate as a boundary condition at the outlet.

Loss-Coefficient
sets the non-dimensional loss coefficient used to compute the pressure drop. See *Specifying the Loss Coefficient* (p. 298) for details.

Turbulence
contains the turbulence parameters.

Specification Method
specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See *Determining Turbulence Parameters* (p. 250) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Backflow Turbulent Kinetic Energy, Backflow Turbulent Dissipation Rate
set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Backflow Turbulent Kinetic Energy, Backflow Specific Dissipation Rate
set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Length Scale
set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Viscosity Ratio
set values for turbulence intensity I and turbulent viscosity ratio μ_t/μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Hydraulic Diameter
set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Backflow Turbulent Viscosity Ratio
sets the value of the backflow turbulent viscosity ratio μ_t/μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method
specifies which method will be used to determine the backflow Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent**

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Intensity or **Reynolds-Stress Components**. If you choose the former, ANSYS FLUENT will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See *Reynolds Stress Model* (p. 679) for details. (This item will appear only for RSM turbulent flow calculations.)

Backflow UU, VV, WW, UV, VW, UW Reynolds Stresses
specify the backflow Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Thermal
contains the thermal parameters.

Backflow Total Temperature
sets the total temperature of the inflow stream should the flow reverse direction

Radiation
contains the boundary conditions for the radiation model at the outlet vent.

External Black Body Temperature Method, Internal Emissivity
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 724) for details.

Participates in Solar Ray Tracing
specifies whether or not the outlet vent participates in solar ray tracing.

Solar Transmissivity Factor
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the outlet vent.

Participates in View Factor Calculation
specifies whether or not the outlet vent participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species
contains the species parameters.

Specify Species in Mole Fractions
allows you to specify the species in mole fractions rather than mass fractions.

Mean Mixture Fraction, Mixture Fraction Variance
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Species Mass Fractions
contains inputs for the mass fractions of defined species. See *Defining Cell Zone and Boundary Conditions for Species* (p. 822) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Backflow Progress Variable
sets the value of the progress variable for premixed turbulent combustion. See *Setting Boundary Conditions for the Progress Variable* (p. 899) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film

consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Multiphase

contains the multiphase parameters.

Backflow Granular Temperature

specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Backflow Volume Fraction

specifies the volume fraction of the secondary phase selected in the *Boundary Conditions Task Page* (p. 1812). This section of the dialog box will appear when one of the multiphase models is being used. See *Defining Multiphase Cell Zone and Boundary Conditions* (p. 1107) for details.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user defines scalars are specified.

User Scalar-n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

appears only if user defines scalars are specified.

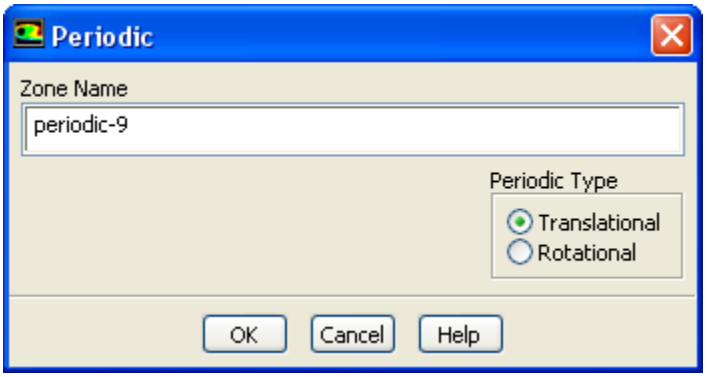
User Scalar-n

specifies the value of the scalar.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.7.11. Periodic Dialog Box

The **Periodic** dialog box sets the boundary conditions for a periodic zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs for Periodic Boundaries* (p. 321) for details about the items below. See *Periodic Flows* (p. 493) for information about fully-developed periodic flow.



Controls

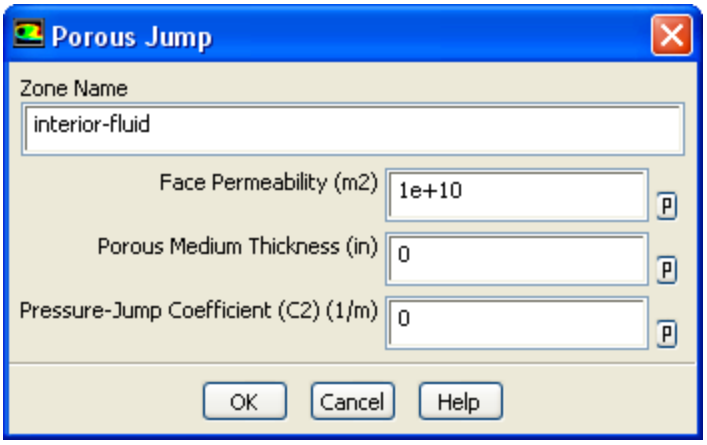
Zone Name
sets the name of the zone.

Periodic Type
indicates whether the periodicity of the domainis **Translational** or **Rotational**.

Periodic Pressure Jump
sets the pressure increase/decrease across the periodic boundary. (This item will not appear if the pressure-based (default) solver is used; it is relevant only for the density-based solvers.)

35.7.12. Porous Jump Dialog Box

The **Porous Jump** dialog box sets the boundary conditions for a porous-jump zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Porous Jump Boundary Conditions* (p. 337) for details about the items below.



Controls

Zone Name
sets the name of the zone.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Face Permeability

sets the face permeability coefficient (α in *Equation 7–112* (p. 337)).

This quantity can be assigned to an input parameter (indicated by the small "p" icon next to the field). Clicking this icon displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters.

Porous Medium Thickness

sets the thickness of the porous medium (Δm).

This quantity can be assigned to an input parameter (indicated by the small "p" icon next to the field). Clicking this icon displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters.

Pressure-Jump Coefficient

sets the pressure-jump coefficient (C_2).

This quantity can be assigned to an input parameter (indicated by the small "p" icon next to the field). Clicking this icon displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters.

Jump Adhesion

sets the adhesion method and contact angle.

Constrained-Two-Sided Adhesion

constrains the contact angle at the porous jump, When this option is disabled then the forced two-sided adhesion treatment is in effect. See Jump Adhesion for more information.

Contact Angle

is the contact angle at the porous jump.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

interior

allows the particles to pass through the boundary.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film

consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

Solar Boundary Conditions

contains the settings for solar ray tracing. This group box is available only if you select **Solar Ray Tracing** from the **Model** list in the **Solar Load** group box of the **Radiation Model** dialog box. See *Solar Ray Tracing* (p. 754) for details.

Participates in Solar Ray Tracing
specifies whether or not the porous jump participates in solar ray tracing.

Absorptivity
contains the settings that define the absorptivity of the porous jump.

Direct Visible
specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the absorption of the porous jump.

Direct IR
specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the absorption of the porous jump.

Transmissivity
contains the settings that define the transmissivity of the porous jump.

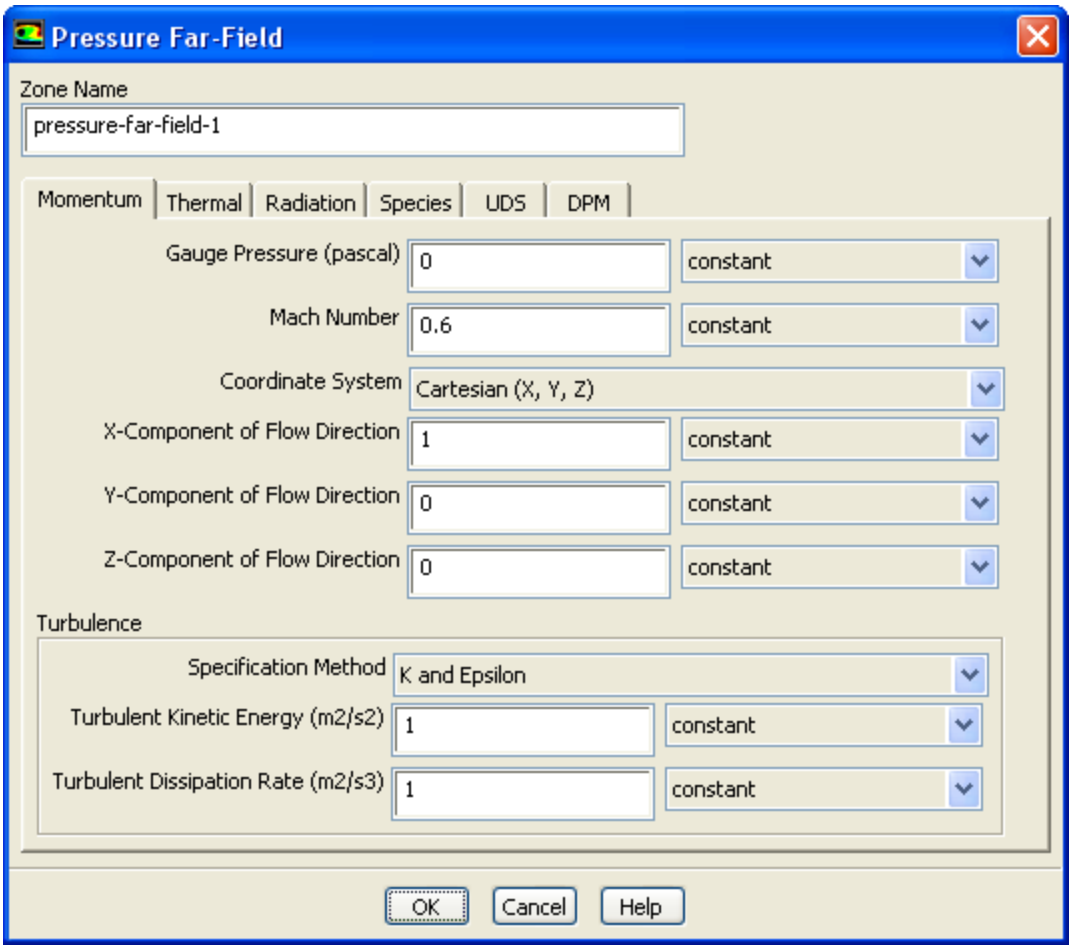
Direct Visible
specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the transmissivity of the porous jump.

Direct IR
specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the transmissivity of the porous jump.

35.7.13. Pressure Far-Field Dialog Box

The **Pressure Far-Field** dialog box sets the boundary conditions for a pressure far-field zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs at Pressure Far-Field Boundaries* (p. 291) for details about defining the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.

Gauge Pressure

sets the far-field gauge static pressure.

Mach Number

sets the far-field Mach number. The Mach number can be subsonic, sonic, or supersonic.

Coordinate System

allows you to select a **Cartesian**, **Cylindrical**, or **Local Cylindrical** coordinate system. This option is available only for 3D geometry.

X,Y,Z-Component of Flow-Direction

set the far-field flow direction. These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial, Tangential, Axial Component of Flow Direction

set the far-field flow direction. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**. Specify the **X**, **Y**, and **Z-Component of Axis Direction** and the **X**, **Y**, and **Z-Coordinate of Axis Origin** for the **Local Cylindrical** coordinate system.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulence

contains the turbulence parameters.

Specification Method

specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See *Determining Turbulence Parameters* (p. 250) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulent Intensity, Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Turbulent Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t/μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Turbulent Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t/μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Turbulence Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS FLUENT will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See *Reynolds Stress Model* (p. 679) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the Reynolds stress components when **Reynolds-Stress Components**is chosen as the **Reynolds-Stress Specification Method**.

Thermal

contains the thermal parameters.

Temperature

sets the far-field static temperature.

Radiation

contains the boundary conditions for the radiation model at the pressure far-field zone.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

External Black Body Temperature Method, Internal Emissivity
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 724) for details.

Participates in Solar Ray Tracing
specifies whether or not the pressure far-field zone participates in solar ray tracing.

Solar Transmissivity Factor
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the pressure far-field zone.

Participates in View Factor Calculation
specifies whether or not the pressure far-field zone participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species
contains the species parameters.

Specify Species in Mole Fractions
allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions
contains inputs for the mass fractions of defined species. See *Defining Cell Zone and Boundary Conditions for Species* (p. 822) for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

Mean Mixture Fraction, Mixture Fraction Variance
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable
sets the value of the progress variable for premixed turbulent combustion. See *Setting Boundary Conditions for the Progress Variable* (p. 899) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

UDS
contains the UDS parameters.

User-Defined Scalar Boundary Condition
appears only if user defines scalars are specified.

User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

DPM
contains the discrete phase parameters.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film

consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

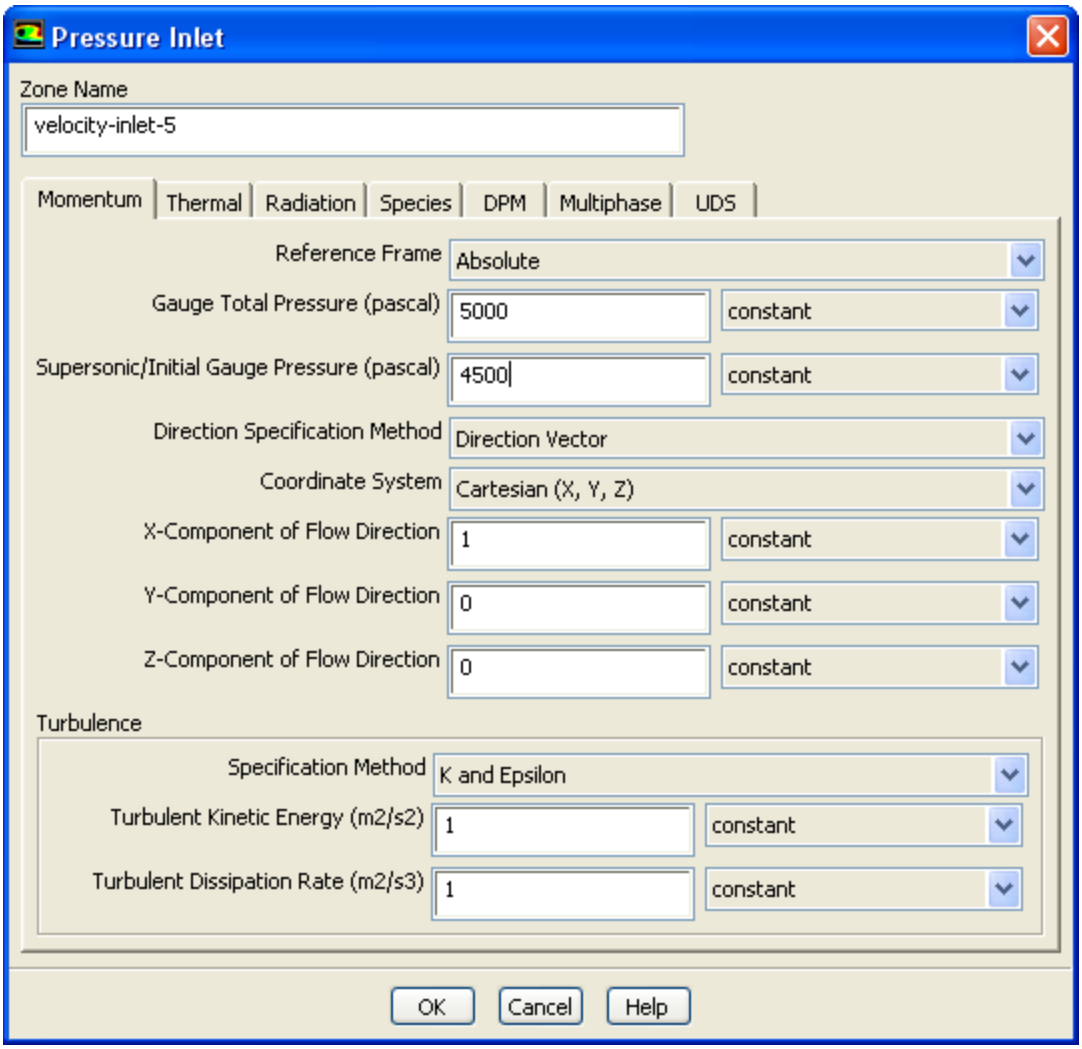
Discrete Phase BC Function

sets the user-defined function from the drop-down list.

35.7.14. Pressure Inlet Dialog Box

The **Pressure Inlet** dialog box sets the boundary conditions for a pressure inlet zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs at Pressure Inlet Boundaries* (p. 255) for details about defining the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.

Reference Frame

specifies the reference frame for the pressure inlet. If the cell zone adjacent to the pressure inlet is moving, you can choose to specify the total temperature, total pressure, and velocity components as **Relative to Adjacent CellZone**or **Absolute**in the **Reference Frame** drop-down list.

Gauge Total Pressure

sets the gauge total (or stagnation) pressure of the inflow stream. If you are using moving reference frames, see *Defining Total Pressure and Temperature* (p. 257) for information about relative and absolute total pressure.

Supersonic/Initial Gauge Pressure

sets the static pressure on the boundary when the flow becomes (locally) supersonic. It is also used to compute initial values for pressure, temperature, and velocity if the pressure inlet boundary condition is selected for computing initial values (see *Initializing the Entire Flow Field Using Standard Initialization* (p. 1240)).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Direction Specification Method

specifies the method you will use to define the flow direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** no inputs are required. See *Defining the Flow Direction* (p. 259) for information on specifying flow direction.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, **Local Cylindrical**,or **Local Cylindrical Swirl** vector components will be input. This item will appear only for 3D cases in which you have selected **Direction Vector** as the **Direction Specification Method**.

X,Y,Z-Component of Flow Direction

set the direction of the flow at the inlet boundary. These items will appear if the selected **Coordinate System** is **Cartesian** or the model is 2D non-axisymmetric.

Radial, Tangential, Axial Component of Flow Direction

set the direction of the flow at the inlet boundary. These items will appear for 2D axisymmetric cases, or for 3D cases for which the selected **Coordinate System** is **Cylindrical** or **Local Cylindrical**.

X,Y,Z-Component of Axis Direction

sets the direction of the axis. These items will appear if the selected **Coordinate System** is **Local Cylindrical**.

X,Y,Z-Coordinate of Axis Origin

sets the location of the axis origin. These items will appear if the selected **Coordinate System** is **Local Cylindrical**.

Radial-, Axial-Component of Flow Direction and Tangential-Component of Velocity

appear for a 3D **Local Cylindrical Swirl** coordinate system. Specify the **X**, **Y**, and **Z-Component of Axis Direction** and the **X**, **Y**, and **Z-Coordinate of Axis Origin**.

Turbulence

contains the turbulence parameters.

Specification Method

specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See *Determining Turbulence Parameters* (p. 250) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate

set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Turbulent Kinetic Energy, Specific Dissipation Rate

set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulent Intensity, Turbulent Length Scale

set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Turbulent Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t/μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulent Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t/μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS FLUENT will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See *Reynolds Stress Model* (p. 679) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the Reynolds stress components when **Reynolds-Stress Components**is chosen as the **Reynolds-Stress Specification Method**.

Thermal

contains the thermal parameters.

Total Temperature

sets the total temperature of the inflow stream. If you are using moving reference frames, see *Defining Total Pressure and Temperature* (p. 257) for information about relative and absolute total temperature.

Radiation

contains the boundary conditions for the radiation model at the pressure inlet.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 724) for details.

Participates in Solar Ray Tracing

specifies whether or not the pressure inlet participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the pressure inlet.

Participates in View Factor Calculation

specifies whether or not the pressure inlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Species Mass Fractions

contains inputs for the mass fractions of defined species. See *Defining Cell Zone and Boundary Conditions for Species* (p. 822) for details about these inputs. (These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mean Mixture Fraction, Mixture Fraction Variance
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable
sets the value of the progress variable for premixed turbulent combustion. See *Setting Boundary Conditions for the Progress Variable* (p. 899) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM
contains the discrete phase parameters.

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap
terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape
reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

Multiphase
contains the multiphase parameters.

Granular Temperature
specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Volume Fraction
specifies the volume fraction of the secondary phase selected in the *Boundary Conditions Task Page* (p. 1812). This section of the dialog box will appear when one of the multiphase models is being used. See *Defining Multiphase Cell Zone and Boundary Conditions* (p. 1107) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UDS

contains the UDS parameters.

User-Defined Scalar Boundary Condition

appears only if user defines scalars are specified.

User Scalar-n

specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value

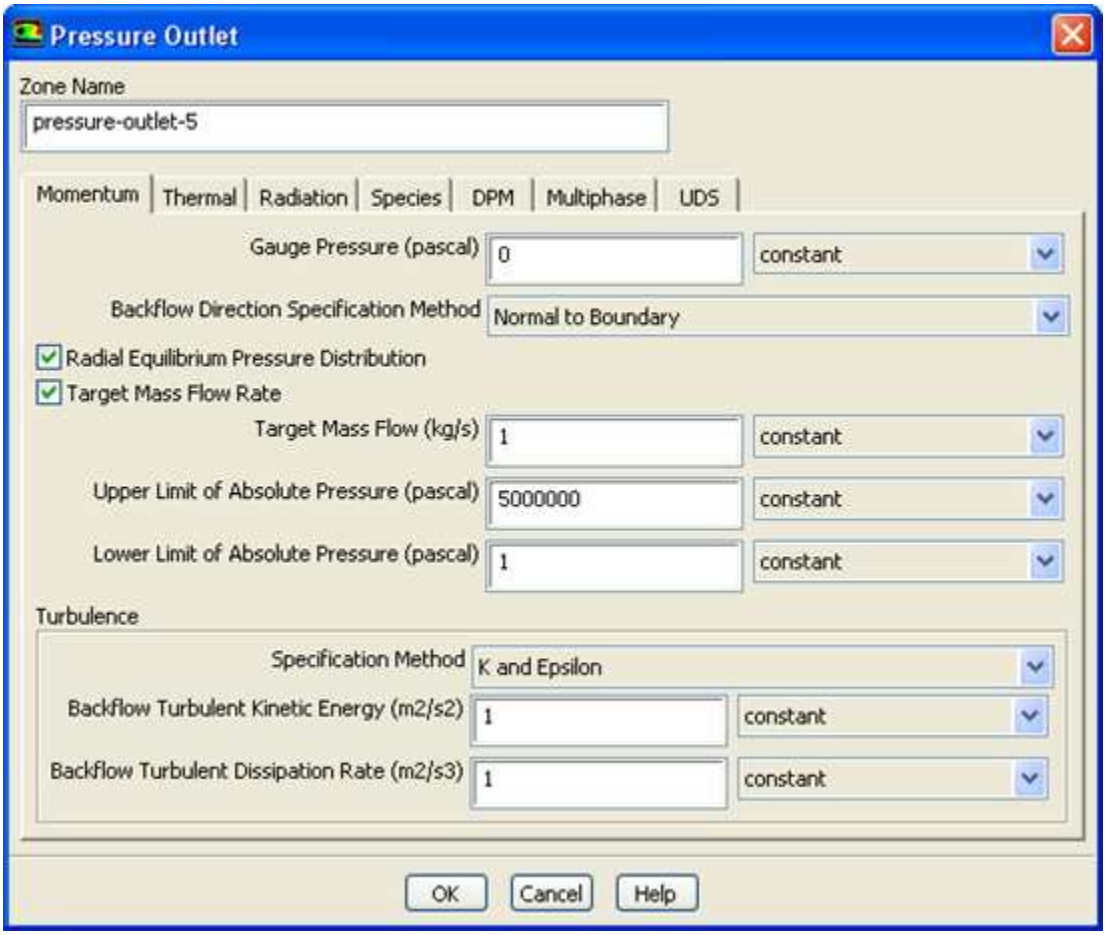
appears only if user defines scalars are specified.

User Scalar-n

specifies the value of the scalar.

35.7.15. Pressure Outlet Dialog Box

The **Pressure Outlet** dialog box sets the boundary conditions for a pressure outlet zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs at Pressure Outlet Boundaries* (p. 282) for details about defining the items below.



Controls

Zone Name

sets the name of the zone.

Momentum

contains the momentum parameters.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Gauge Pressure
sets the gauge pressure at the outflow boundary.

Backflow Direction Specification Method
sets the direction of the inflow stream should the flow reverse direction. If you choose **Direction Vector**, you will define the flow direction components, and if you choose **Normal to Boundary** or **From Neighboring Cell**, no inputs are required. See *Inputs at Pressure Outlet Boundaries* (p. 282) for information on specifying flow direction.

Radial Equilibrium Pressure Distribution
enables the radial equilibrium pressure distribution. See *Defining Static Pressure* (p. 283)for details.

This item appears only for 3D and axisymmetric swirl solvers.

Average Pressure Specification
allows the pressure along the outlet boundary to vary, but maintain an average equivalent to the specified value in the **Gauge Pressure** input field. In this boundary implementation, the pressure variation provides a low level of non-reflectivity. For more details, see*Calculation Procedure at Pressure Outlet Boundaries* (p. 285).

Note

The **Average Pressure Specification** option is not available if the **Radial Equilibrium Pressure Distribution** option is enabled.

Target Mass Flow Rate
allows you to set mass flow rate as a boundary condition at the outlet.

Target Mass Flow
allows you to specify the flow as either a constant value or a UDF.

Upper Limit of Absolute Pressure, Lower Limit of Absolute Pressure
specifies the range of the pressure limits, which have different pressure variations on different boundaries. The upper and lower pressure limits can be specified as a constant or a profile.

Turbulence
contains the turbulence parameters.

Specification Method
specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See *Determining Turbulence Parameters* (p. 250) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Backflow Turbulent Kinetic Energy, Backflow Turbulent Dissipation Rate
set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Backflow Turbulent Kinetic Energy, Backflow Specific Dissipation Rate
set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Turbulent Length Scale
set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Backflow Turbulent Intensity, Backflow Turbulent Viscosity Ratio
set values for turbulence intensity I and turbulent viscosity ratio μ_t/μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Backflow Turbulent Intensity, Backflow Hydraulic Diameter
set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Backflow Turbulent Viscosity Ratio
sets the value of the backflow turbulent viscosity ratio μ_t/μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Reynolds-Stress Specification Method
specifies which method will be used to determine the backflow Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS FLUENT will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See *Reynolds Stress Model* (p. 679) for details. (This item will appear only for RSM turbulent flow calculations.)

Backflow UU, VV, WW, UV, VW, UW Reynolds Stresses
specify the backflow Reynolds stress components when **Reynolds-Stress Components** is chosen as the **Reynolds-Stress Specification Method**.

Thermal
contains the thermal parameters.

Backflow Total Temperature
sets the total temperature of the inflow stream should the flow reverse direction

Radiation
contains the boundary conditions for the radiation model at the pressure outlet.

External Black Body Temperature Method, Internal Emissivity
set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 724) for details.

Participates in Solar Ray Tracing
specifies whether or not the pressure outlet participates in solar ray tracing.

Solar Transmissivity Factor
specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the pressure outlet.

Participates in View Factor Calculation
specifies whether or not the pressure outlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species
contains the species parameters.

Specify Species in Mole Fractions
allows you to specify the species in mole fractions rather than mass fractions.

Mean Mixture Fraction, Mixture Fraction Variance
set inlet values for the PDF mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance
set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Species Mass Fractions
contains inputs for the mass fractions of defined species. See *Defining Cell Zone and Boundary Conditions for Species* (p. 822) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Backflow Progress Variable
sets the value of the progress variable for premixed turbulent combustion. See *Setting Boundary Conditions for the Progress Variable* (p. 899) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM
contains the discrete phase parameters.

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap
terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape
reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

Multiphase
contains the multiphase parameters.

Backflow Granular Temperature
specifies temperature for the solids phase and is proportional to the kinetic energy of the random motion of the particles.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Backflow Volume Fraction
specifies the volume fraction of the secondary phase selected in the *Boundary Conditions Task Page* (p. 1812). This section of the dialog box will appear when one of the multiphase models is being used. See *Defining Multiphase Cell Zone and Boundary Conditions* (p. 1107) for details.

UDS
contains the UDS parameters.

User-Defined Scalar Boundary Condition
appears only if user defines scalars are specified.

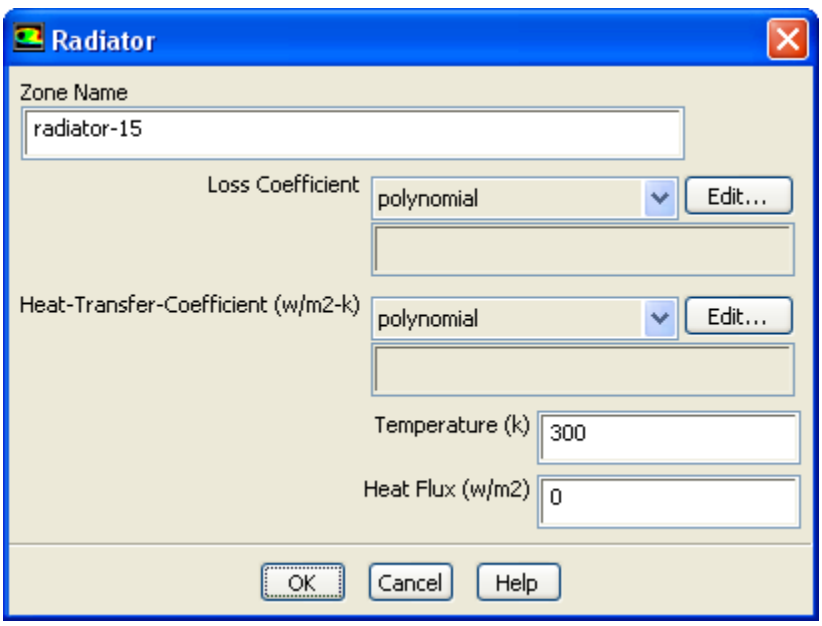
User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

35.7.16. Radiator Dialog Box

The **Radiator** dialog box sets the boundary conditions for a radiator model zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *User Inputs for Radiators* (p. 332) for details about the items below.



Controls

Zone Name
sets the name of the zone.

Loss Coefficient
specifies the loss coefficient as a constant value or as a polynomial, piecewise-linear, or piecewise-polynomial function of velocity. See *Defining the Pressure Loss Coefficient Function* (p. 333) for details.

Heat-Transfer-Coefficient
specifies the heat-transfer coefficient as a constant value or as a polynomial, piecewise-linear, or piecewise-polynomial function of velocity. See *Defining the Heat Flux Parameters* (p. 335) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Temperature
sets the temperature used to compute heat flux from the radiator using the **Heat-Transfer-Coefficient**. If **Temperature**is zero, the **Heat Flux** condition is used instead.

Heat Flux
sets the heat flux at the radiator surface (used only when **Temperature** is zero).

Discrete Phase BC Type
sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

interior
allows the particles to pass through the boundary.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap
terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape
reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet
indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film
consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

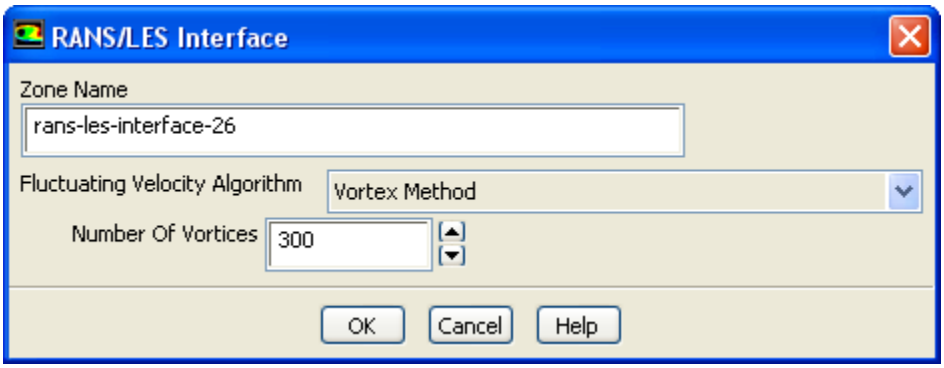
user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function
sets the user-defined function from the drop-down list.

35.7.17. RANS/LES Interface Dialog Box

The **RANS/LES Interface** dialog box can be used to create artificial resolved turbulence (fluctuation/perturbations) at the interface where the flow proceeds from the RANS zone into the LES zone of the computational domain for Embedded LES turbulent flows. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Setting Up the Embedded Large Eddy Simulation (E-LES) Model* (p. 670) for more information about RANS/LES interfaces.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name
sets the name of the RANS/LES interface.

Fluctuating Velocity Algorithm
displays the methods for generating fluctuating velocity components at the RANS/LES interface. Available options include:

- No Perturbations
- Spectral Synthesizer
- Vortex Method

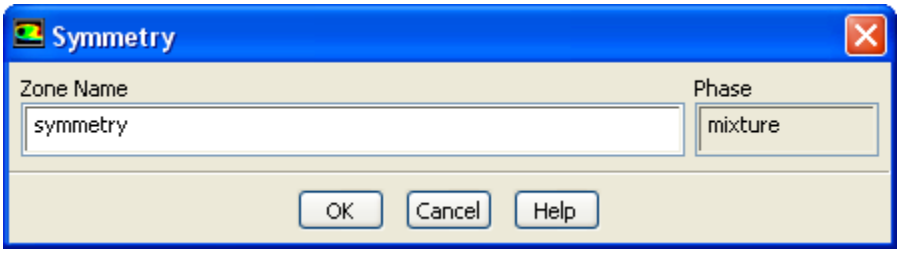
Number of Vortices
displays the amount of vortices that the selected fluctuating velocity method distributes randomly over the face zone and uses to generate turbulent fluctuations (available for the Vortex Method only).

Important

The RANS/LES 'interface' can either be an interior zone (that has been assigned to be a **rans-les-interface** zone), or it can be a non-conformal interface. If it is a non-conformal interface, the you need to identify the name of the non-conformal interface's "interior" zone (e.g., using the **Mesh Interfaces** task page), and then go to that zone in the **Boundary Conditions** task page.

35.7.18. Symmetry Dialog Box

The **Symmetry** dialog box can be used to modify the name of a symmetry zone; there are no conditions to be set. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Symmetry Boundary Conditions* (p. 319) for information about symmetry boundaries.



Controls

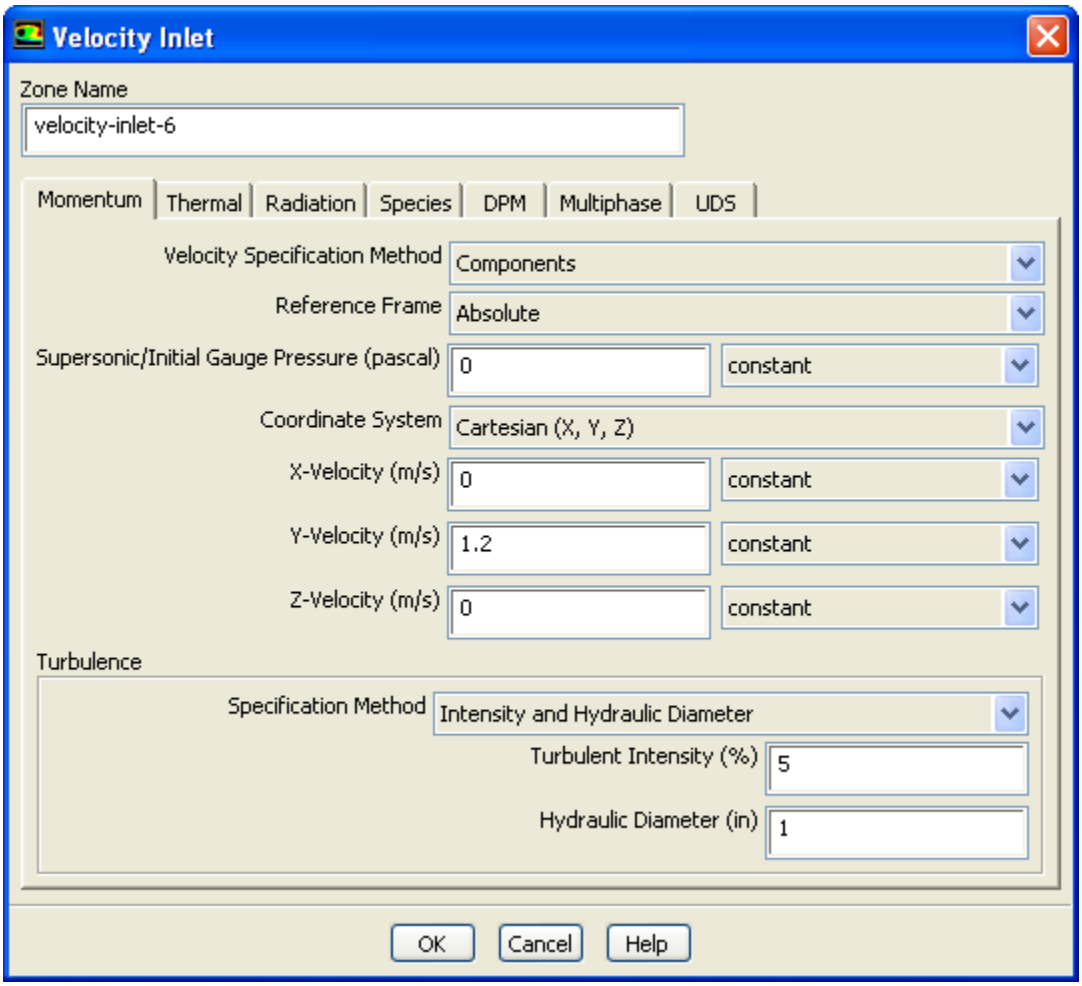
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Zone Name
sets the name of the zone.

Phase
displays the name of the phase. This item is available only for multiphase flows.

35.7.19. Velocity Inlet Dialog Box

The **Velocity Inlet** dialog box sets the boundary conditions for a velocity inlet zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs at Velocity Inlet Boundaries* (p. 265) for details about defining the items below.



Controls

Zone Name
sets the name of the zone.

Phase
displays the name of the phase. This item appears if the VOF, mixture, or Eulerian multiphase model is being used.

Open Channel Wave BC
allows you to set specific parameters for a particular boundary for open channel wave boundaries. This is available when the volume of fluid multiphase model is selected.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Momentum

contains the momentum parameters.

Velocity Specification Method

sets the method used to define the inflow velocity.

Flow Direction Specification Method

sets the method used to define the direction of flow of the wave. This is available when you enable the **Open Channel Wave BC** option.

Magnitude and Direction

allows specification in terms of a **Velocity Magnitude** and **Flow-Direction**.

Components

allows specification in terms of the Cartesian, cylindrical, or local cylindrical velocity components.

Magnitude, Normal to Boundary

allows specification of a **Velocity Magnitude** normal to the boundary.

Reference Frame

specifies relative or absolute velocity inputs. You can choose to enter **Absolute** velocities or velocities **Relative to Adjacent Cell Zone**. If you are not using moving reference frames, both options are equivalent, so you need not choose.

Uniform Flow Velocity Magnitude

is the flow velocity, specified as a constant or a parameter.

Coordinate System

specifies whether **Cartesian**, **Cylindrical**, or **Local Cylindrical** velocities will be input. This item will appear only for 3D cases in which you have selected **Magnitude and Direction** or **Components** as the **Velocity Specification Method**.

X,Y,Z-Velocity

set the components of the velocity vector at the inflow boundary. These items will appear for 2D non-axisymmetric models, or for 3D models if you select the **Components** option as the **Velocity Specification Method** and **Cartesian** as the **Coordinate System**.

Radial, Tangential, Axial-Velocity

set the components of the velocity vector at the inflow boundary. These items will appear for 3D models if you select the **Components** option as the **Velocity Specification Method** and **Cylindrical** or **Local Cylindrical** as the **Coordinate System**.

Axial, Radial, Swirl-Velocity

set the components of the velocity vector at the inflow boundary. These items will appear for 2D axisymmetric models.

Important

Swirl-Velocity will appear only for 2D axisymmetric swirl models.

Angular Velocity

specifies the angular velocity Ω for a 3D flow. This item will appear for a 3D model if you select the **Components** option as the **Velocity Specification Method** and **Cylindrical** or **Local Cylindrical** as the **Coordinate System**.

Swirl Angular Velocity

specifies the swirl angular velocity Ω for an axisymmetric swirling flow. This item will appear for an axisymmetric swirl model if you choose **Components** as the **Velocity Specification Method**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Velocity Magnitude
sets the magnitude of the velocity vector at the inflow boundary. This item will appear if you select the **Magnitude and Direction** or **Magnitude, Normal to Boundary** option as the **Velocity Specification Method**.

X,Y,Z-Component of Flow-Direction
set the direction of the velocity vector at the inflow boundary. These items will appear for 2D non-axisymmetric models if you select the **Magnitude and Direction** option as the **Velocity Specification Method**, or for 3D models if you select the **Magnitude and Direction** option as the **Velocity Specification Method** and **Cartesian** as the **Coordinate System**.

Radial, Tangential, Axial-Component of Flow Direction
set the direction of the velocity vector at the inlet boundary. These items will appear for 3D models if you select the **Magnitude and Direction** option as the **Velocity Specification Method** and **Cylindrical** or **Local Cylindrical** as the **Coordinate System**, or for 2D axisymmetric models.

Important

Tangential-Velocity will appear only for 2D axisymmetric swirl models.

X,Y,Z-Component of Axis Direction
sets the direction of the axis. These items will appear if the selected **Coordinate System** is **Local Cylindrical**.

X,Y,Z-Coordinate of Axis Origin
sets the location of the axis origin. These items will appear if the selected **Coordinate System** is **Local Cylindrical**.

Outflow Gauge Pressure
specifies the pressure to be used as the pressure outlet condition if flow exits the domain at any face on the velocity inlet boundary. (Note that this effect is similar to that of the "velocity far-field" boundary that was available in RAMPANT 3.)

This item appears only for the density-based solvers.

Turbulence
contains the turbulence parameters.

Specification Method
specifies which method will be used to input the turbulence parameters. You can choose **K and Epsilon** (k- ε models and RSM only), **K and Omega** (k- ω models only), **Intensity and Length Scale**, **Intensity and Viscosity Ratio**, **Intensity and Hydraulic Diameter**, or **Turbulent Viscosity Ratio** (Spalart-Allmaras model only). See *Determining Turbulence Parameters* (p. 250) for information about the inputs for each of these methods. (This item will appear only for turbulent flow calculations.)

Turbulent Kinetic Energy, Turbulent Dissipation Rate
set values for the turbulence kinetic energy k and its dissipation rate ε. These items will appear if you choose **K and Epsilon** as the **Specification Method**.

Turbulent Kinetic Energy, Specific Dissipation Rate
set values for the turbulence kinetic energy k and its specific dissipation rate ω. These items will appear if you choose **K and Omega** as the **Specification Method**.

Turbulent Intensity, Turbulent Length Scale
set values for turbulence intensity I and turbulence length scale ℓ. These items will appear if you choose **Intensity and Length Scale** as the **Specification Method**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Turbulent Intensity, Turbulent Viscosity Ratio

set values for turbulence intensity I and turbulent viscosity ratio μ_t/μ. These items will appear if you choose **Intensity and Viscosity Ratio** as the **Specification Method**.

Turbulent Intensity, Hydraulic Diameter

set values for turbulence intensity I and hydraulic diameter L. These items will appear if you choose **Intensity and Hydraulic Diameter** as the **Specification Method**.

Turbulent Viscosity Ratio

sets the value of the turbulent viscosity ratio μ_t/μ. This item will appear if you choose **Turbulent Viscosity Ratio** as the **Specification Method**.

Turbulent Intensity

sets the value of the turbulence intensity I for the LES model.

Reynolds-Stress Specification Method

specifies which method will be used to determine the Reynolds stress boundary conditions when the Reynolds stress turbulence model is used. You can choose either **K or Turbulent Intensity** or **Reynolds-Stress Components**. If you choose the former, ANSYS FLUENT will compute the Reynolds stresses for you. If you choose the latter, you will explicitly specify the Reynolds stresses yourself. See *Reynolds Stress Model* (p. 679) for details. (This item will appear only for RSM turbulent flow calculations.)

UU, VV, WW, UV, VW, UW Reynolds Stresses

specify the Reynolds stress components when **Reynolds-Stress Components**is chosen as the **Reynolds-Stress Specification Method**.

Thermal

contains the thermal parameters.

Temperature

specifies the static temperature of the flow.

Radiation

contains the boundary conditions for the radiation model at the velocity inlet.

External Black Body Temperature Method, Internal Emissivity

set the radiation boundary conditions when you are using the P-1 model, the DTRM, the discrete ordinates model, or the S2S model for radiation heat transfer. See *Defining Boundary Conditions for Radiation* (p. 724) for details.

Participates in Solar Ray Tracing

specifies whether or not the velocity inlet participates in solar ray tracing.

Solar Transmissivity Factor

specifies a multiplier (ranging from 0 to 1) that is applied to the solar irradiation entering the domain through the velocity inlet.

Participates in View Factor Calculation

specifies whether or not the velocity inlet participates in the view factor calculation as part of the S2S radiation model. This parameter is available only if you select the **Surface to Surface** radiation model.

Species

contains the species parameters.

Specify Species in Mole Fractions

allows you to specify the species in mole fractions rather than mass fractions.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Species Mass Fractions

contains inputs for the mass fractions of defined species. See *Defining Cell Zone and Boundary Conditions for Species* (p. 822) for details about these inputs. These items will appear only if you are modeling non-reacting multi-species flow or you are using the finite-rate reaction formulation.

Mean Mixture Fraction, Mixture Fraction Variance

set inlet values for the PDF mixture fraction and its variance. These items will appear only if you are using the non-premixed or partially premixed combustion model.

Secondary Mean Mixture Fraction, Secondary Mixture Fraction Variance

set inlet values for the secondary mixture fraction and its variance. (These items will appear only if you are using the non-premixed or partially premixed combustion model with two mixture fractions.)

Progress Variable

sets the value of the progress variable for premixed turbulent combustion. See *Setting Boundary Conditions for the Progress Variable* (p. 899) for details.

This item will appear only if the premixed or partially premixed combustion model is used.

DPM

contains the discrete phase parameters.

Discrete Phase BC Type

sets the way that the discrete phase behaves with respect to the boundary. This item appears when one or more injections have been defined.

reflect

rebounds the particle off the boundary with a change in its momentum as defined by the coefficient of restitution. (See *Figure 25.19* (p. 1051))

trap

terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape

reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

wall-jet

indicates that the direction and velocity of the droplet particles are given by the resulting momentum flux, which is a function of the impingement angle. See Figure 16.2: ""Wall Jet" Boundary Condition for the Discrete Phase" in the Theory Guide.

wall-film

consists of four regimes: stick, rebound, spread, and splash, which are based on the impact energy and wall temperature. Detailed information on the wall-film model can be found in Wall-Film Model Theory in the Theory Guide. The **Number Of Splashed Drops** must be specified.

user-defined

specifies a user-defined function to define the discrete phase boundary condition type.

Discrete Phase BC Function

sets the user-defined function from the drop-down list.

Multiphase

contains the multiphase parameters.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Volume Fraction
specifies the volume fraction of the secondary phase selected in the *Boundary Conditions Task Page* (p. 1812). This section of the dialog box will appear when one of the multiphase models is being used. See *Defining Multiphase Cell Zone and Boundary Conditions* (p. 1107) for details.

Wave Theory
allows you to choose from **First Order Airy** (the default), **Second Order Stokes**, **Third Order Stokes**,**Fourth Order Stokes**, and **Fifth Order Stokes**. Information about the types of wave theory is available in Open Channel Wave Boundary Conditions in the Theory Guide.

Wave BC Options
allows you to choose between **Shallow/Intermediate Waves** or **Short Gravity Waves**. Information about the two types of waves is available in Backflow Volume Fraction Specification in the Theory Guide.

Secondary Phase for Inlet
is where the specified parameters are valid only for one secondary phase. In case of a three-phase flow, select the corresponding secondary phase from this list.

Wave Amplitude
is the amplitude of the shallow wave or short gravity wave.

Wave Length
is the wave length of the shallow wave or short gravity wave.

Free Surface Level
can be determined using the absolute value of height from the free surface to the origin in the direction of gravity, or by applying the correct sign based on whether the free surface level is above or below the origin.

Bottom Level
is valid only for shallow waves. The bottom level is used for calculating the liquid height.

Phase Difference
is the phase difference between one wave and another.

UDS
contains the UDS parameters.

User-Defined Scalar Boundary Condition
appears only if user defines scalars are specified.

User Scalar-n
specifies whether the scalar is a specified flux or a specified value.

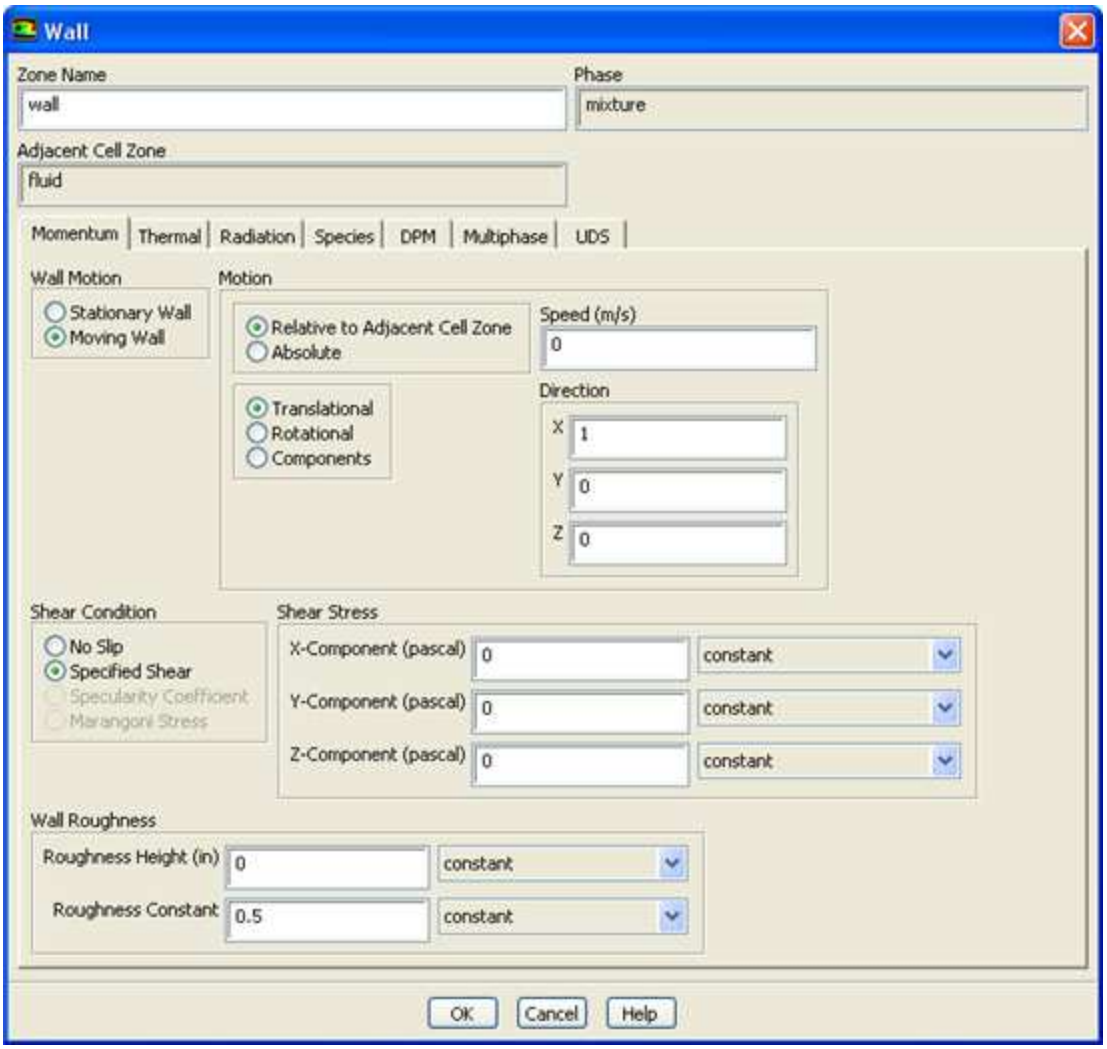
User-Defined Scalar Boundary Value
appears only if user defines scalars are specified.

User Scalar-n
specifies the value of the scalar.

35.7.20. Wall Dialog Box

The **Wall** dialog box sets the boundary conditions for a wall zone. It is opened from the *Boundary Conditions Task Page* (p. 1812). See *Inputs at Wall Boundaries* (p. 300) for details about defining the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Name

sets the name of the zone.

Phase

displays the name of the phase. This item appears if the VOF, mixture, or Eulerian multiphase model is being used.

Adjacent Cell Zone

shows the name of the cell zone adjacent to the wall. (This is for informational use only; you cannot edit this field.)

Momentum

displays the momentum boundary conditions.

Wall Motion

contains options for specifying whether or not the wall is moving.

Stationary Wall

specifies that the wall is not moving relative to the adjacent cell zone.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Moving Wall

enables specification of the tangential wall motion. Tangential wall motion is applicable only to viscous flows. Since the inviscid slip condition decouples the tangential wall velocity from the governing equations, tangential wall motion has no effect on inviscid flow.

Motion

contains inputs related to wall motion. See *Velocity Conditions for Moving Walls* (p. 302) for details.

Relative to Adjacent Cell Zone

enables the specification of a wall velocity relative to the velocity of the adjacent cell zone.(If the adjacent cell zone is not moving, this is equivalent to **Absolute**.)

Absolute

enables the specification of an absolute wall velocity,

Translational

enables the specification of a translational wall velocity.

Rotational

enables the specification of a rotational wall velocity.

Components

enables the specification of wall velocity components.

Speed

sets the translational or rotational speed of the wall (depending on whether you selected **Translational** or **Rotational**).

The rotational speed can be assigned to an input parameter (indicated by the small "p" icon next to the field). Clicking this icon displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters.

Direction

sets the direction vector of the translational velocity. (This item will appear if you have chosen the **Translational** option.)

Rotation-Axis Origin

sets the coordinates of the origin of the axis of rotation, thereby determining the location of the axis. (This item will appear if you have chosen the **Rotational** option for a non-axisymmetric case.)

Rotation-Axis Direction

sets the direction vector for the axis of rotation. (This item will appear if you have chosen the **Rotational** option for a non-axisymmetric case.)

Velocity Components

sets the **X**, **Y**, and **Z-Velocity**components of the wall motion. (This item will appear if you have chosen the **Components** option.)

Shear Condition

contains options for specifying the shear conditions at the wall.

No Slip

specifies a no-slip condition at the wall. No further inputs are required.

Specified Shear

enables specification of zero or non-zero shear. See *Specified Shear* (p. 304) for details. This option is not available for moving walls.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Marangoni Stress
enables the specification of shear stress caused by the variation of surface tension due to temperature. This option is not available for moving walls.

Shear Stress
contains inputs related to wall shear. These items will appear when **Specified Shear** is selected as the **Shear Condition**. See *Specified Shear* (p. 304) for details.

X-Component, Y-Component, Z-Component, Swirl Component
specify the x, y, and z or swirl components of shear for a slip wall. **Swirl Component** is available only for axisymmetric swirl cases.

Specularity Coefficient
is used in multiphase granular flow. You can specify the specularity coefficient such that when the value is zero, this condition is equivalent to zero shear at the wall, but when the value is near unity, there is a significant amount of lateral momentum transfer.

Specularity Coefficient
allows you to enter a value between zero and one, which controls the amount of lateral momentum transfer.

Marangoni Stress
contains inputs related to Marangoni stress. This item will appear when **Marangoni Stress** is selected as the **Shear Condition**. See *Marangoni Stress* (p. 305) for details.

Surface Tension Gradient
specifies the surface tension gradient with respect to temperature ($d\sigma/dT$ in *Equation 7–82* (p. 305)).

Wall Roughness
contains inputs for defining wall roughness in turbulent calculations. See *Wall Roughness Effects in Turbulent Wall-Bounded Flows* (p. 306) for details.

Roughness Height
sets the roughness height K_s (see *Setting the Roughness Parameters* (p. 308) for details).

Roughness Constant
sets the roughness constant C_{K_s} (see *Setting the Roughness Parameters* (p. 308) for details).

Wall Adhesion
contains inputs related to wall adhesion. This section of the dialog box will appear if you are using the VOF model and have enabled wall adhesion in the e *Phase Interaction Dialog Box* (p. 1791).

Contact Angles
specifies the contact angle at the wall for each pair of phases (θ_w in *Figure 26.25* (p. 1141)in the Theory Guide). See *Steps for Setting Boundary Conditions* (p. 1115) for details.

Thermal
contains the thermal parameters. This tab is available only when the energy equation is turned on.

Thermal Conditions
contains radio buttons for selecting the thermal boundary condition type. See *Thermal Boundary Conditions at Walls* (p. 309) for details about these inputs:

Heat Flux
selects a specified heat flux condition.

Temperature
selects a specified wall temperature condition.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Convection
selects a convective heat transfer boundary condition model.

Radiation
selects an external radiation boundary condition.

Mixed
selects a combined convection/external radiation boundary condition.

Coupled
selects a coupled heat transfer condition. It is applicable only to walls that form the interface between two regions (such as the fluid/solid interface for a conjugate heat transfer problem).

Once a condition type has been selected, the appropriate conditions can be specified.

Heat Flux
sets the wall heat flux to be used for the **Heat Flux** condition. A specification of zero **Heat Flux** is simply the adiabatic condition (no heat transfer). A positive value of heat flux implies that heat is input *into* the domain.

Temperature
sets the wall temperature to be used for the **Temperature** condition.

Heat Transfer Coefficient
sets the convective heat transfer coefficient to be used for the **Convection** condition (h_{eff} in *Equation 7–94* (p. 318)).

Free Stream Temperature
sets the reference or free stream temperature to be used for the **Convection** condition (T_{ext} in *Equation 7–94* (p. 318)).

External Emissivity
sets the emissivity of the external wall to be used for the **Radiation** condition (ε_{ext} in *Equation 7–95* (p. 318)).

External Radiation Temperature
sets the temperature of the external radiation source/sink to be used for the **Radiation** condition (T_{∞} in *Equation 7–95* (p. 318)).

Internal Emissivity
sets the internal emissivity of the wall. This item will appear only if you are using the gray P-1 model, the DTRM, the gray discrete ordinates model, or the S2S model for radiation heat transfer. (Note that it will not appear if you are using the non-gray P-1 model or the non-gray discrete ordinates model. In these cases, you will enter the **Internal Emissivity** for each band in the **Radiation** tab.)

Wall Thickness
sets the thickness of the wall for calculation of thin-wall thermal resistance. (See *Thin-Wall Thermal Resistance Parameters* (p. 311) for details.)

Heat Generation Rate
sets the rate of heat generation in the wall.

Contact Resistance
sets the contact resistance (R_c in Equation 18–23 in the Theory Guide) at the wall. See *Modeling Solidification and Melting* (p. 1201) for details. This item appears only when the solidification/melting model is used.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Material Name

sets the material type of the wall. The conductivity of the material is used for the calculation of thin-wall thermal resistance. (See *Thin-Wall Thermal Resistance Parameters* (p. 311) for details.) **Material** is used only when **Wall Thickness** is non-zero. Materials are defined with the *Materials Task Page* (p. 1735).

Shell Conduction

enables shell conduction for the wall. See *Shell Conduction in Thin-Walls* (p. 313) for details.

Radiation

displays the boundary conditions for the S2S model, the DO model, and the non-gray P-1 model at the wall. This tab is only available if you are using the surface to surface model, the discrete ordinates model, or the non-gray P-1 model. See *Forming Surface Clusters* (p. 711), *Wall Boundary Conditions for the DO Model* (p. 726), and *Wall Boundary Conditions for the DTRM, and the P-1, S2S, and Rosseland Models* (p. 725) for details.

BC Type

contains a drop-down list of available radiation boundary condition types. The available options are **opaque** and **semi-transparent**. This item will appear only if you are using the discrete ordinates model.

Internal Emissivity

specifies the internal emissivity of the wall in each wavelength band. This item will appear only if you are using the non-gray discrete ordinates model and you have selected **opaque** as the **BC Type**, or if you are using the non-gray P-1 model.

Diffuse Fraction

specifies the fraction of the irradiation that is to be treated as diffuse. By default, the **Diffuse Fraction** is set to 1, indicating that all of the irradiation is diffuse. If the non-gray DO model is being used, the **Diffuse Fraction** can be specified for each band. This item will appear only if you are using the discrete ordinates model.

Beam Width

specifies the beam width for an external semi-transparent wall in terms of the **Theta** and **Phi** extents. This item will appear only if you are using the discrete ordinates radiation model and you have selected **semi-transparent** as the **BC Type**.

Beam Direction

specifies the beam direction as an **X,Y,Z** vector. You can specify the **Beam Direction** as a constant, a profile, or a UDF. This item will appear only if you are using the discrete ordinates radiation model and you have selected **semi-transparent** as the **BC Type**.

Direct Irradiation

specifies the value of the irradiation flux. If the non-gray DO model is being used, a constant **Direct Irradiation** can be specified for each band.

This item will appear only if you are using the discrete ordinates radiation model and you have selected **semi-transparent** as the **BC Type**.

Apply Direct Irradiation Parallel to the Beam

is the default means of specifying the scale of irradiation flux. When enabled, ANSYS FLUENT assumes that the value of **Direct Irradiation** that you specify is the irradiation flux parallel to the **Beam Direction**. When deselected, ANSYS FLUENT instead assumes that the value specified is the flux parallel to the face normals and will calculate the resulting beam parallel flux for every face. This item will appear only if you are using the discrete ordinates model.

Diffuse Irradiation

specifies the value of the irradiation flux. If the non-gray DO model is being used, a constant **Diffuse Irradiation** can be specified for each band.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This item will appear only if you are using the discrete ordinates radiation model and you have selected **semi-transparent** as the **BC Type**.

Solar Boundary Conditions

contains the settings for solar ray tracing. This group box is available only if you select **Solar Ray Tracing** from the **Model** list in the **Solar Load** group box of the **Radiation Model** dialog box. See *Solar Ray Tracing* (p. 754) for details.

Participates in Solar Ray Tracing
specifies whether or not the wall participates in solar ray tracing.

Absorptivity
contains the settings that define the absorptivity of wall.

Direct Visible
specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the absorption of the wall. The value should be defined for normal incident rays.

Direct IR
specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the absorption of the wall. The value should be defined for normal incident rays.

Diffuse Hemispherical
specifies a multiplier (ranging from 0 to 1) that is applied to the diffuse solar radiation to account for the absorption of the wall. This setting is only available for semi-transparent walls.

Transmissivity
contains the settings that define the transmissivity of wall. This group box is only available when **semi-transparent** is selected for **BC Type**.

Direct Visible
specifies a multiplier (ranging from 0 to 1) that is applied to the visible portion of the direct solar radiation spectrum to account for the transmissivity of the wall. The value should be defined for normal incident rays. This setting is only available for semi-transparent walls.

Direct IR
specifies a multiplier (ranging from 0 to 1) that is applied to the infrared portion of the direct solar radiation spectrum to account for the transmissivity of the wall. The value should be defined for normal incident rays. This setting is only available for semi-transparent walls.

Diffuse Hemispherical
specifies a multiplier (ranging from 0 to 1) that is applied to the diffuse solar irradiation to account for the transmissivity of the wall. This setting is only available for semi-transparent walls.

S2S Parameters
contains the settings for the S2S radiation model. This group box is available only if you select the **Surface to Surface** radiation model. See *Forming Surface Clusters* (p. 711) for details.

Faces Per Surface Cluster
sets the number of faces per surface cluster (FPSC) for the wall, and thus controls the number of radiating surfaces and (if you select **Cluster to Cluster** for **Basis** in the **View Factors and Clustering** dialog box) view factor surfaces.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Critical Zone
specifies that the wall is a critical zone. When this option is enabled, the value entered for **Faces Per Surface Cluster** will not be altered when you use **Automatic** clustering in the **View Factors and Clustering** dialog box, and impacts the calculations and actions performed by the buttons in the **Maximum Distance from Critical Zone** group box of the **Participating Boundary Zones** dialog box.

Participates in View Factor Calculation
specifies whether or not the wall participates in the view factor calculation as part of the S2S radiation model. This option is available only if you select the **Surface to Surface** radiation model.

Species
contains the species parameters. This tab is available only if you have enabled the **Species Transport** model in the *Species Model Dialog Box* (p. 1681).

Reaction
activates reactions at the wall. This item will appear only if you have enabled any of the reactions in the *Species Model Dialog Box* (p. 1681).

Reaction Mechanisms
allows you to specify a defined group, or mechanism, of available reactions. This item will appear only if the **Reaction** option has been turned on. See *Defining Zone-Based Reaction Mechanisms* (p. 816) for details about defining reaction mechanisms.

Surface Area Washcoat Factor
allows you to specify a factor, which multiplies the wall area to account for the increased surface area of washcoats. This item will appear only if the **Reaction** option has been turned on. See *Species Boundary Conditions for Walls* (p. 314) for details.

Species Boundary Condition
contains options for the specification of species boundary conditions. See *Species Boundary Conditions for Walls* (p. 314) for details.

Zero Diffusive Flux
indicates a zero-flux condition for a species. This is the default condition.

Specified Mass Fraction
indicates that the species mass fraction will be specified.

Species Mass Fractions
contains inputs for the species mass fractions of any species for which you have selected **Species Mass Fraction** as the **Species Boundary Condition**.

DPM
contains the discrete phase parameters. This tab is available only if you have defined at least one injection.

Discrete Phase Model Conditions
contains inputs for setting the fate of particle trajectories at the wall. These options will appear when one or more injections have been defined. See *Setting Boundary Conditions for the Discrete Phase* (p. 1050) for details.

Boundary Cond. Type
sets the way that the discrete phase behaves with respect to the boundary.

reflect
rebounds the particle off the boundary with a change in its momentum as defined by the coefficients of restitution. (See *Figure 25.19* (p. 1051))

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

trap
terminates the trajectory calculations and records the fate of the particle as "trapped". In the case of evaporating droplets, their entire mass instantaneously passes into the vapor phase and enters the cell adjacent to the boundary. See *Figure 25.20* (p. 1051).

escape
reports the particle as having "escaped" when it encounters the boundary. Trajectory calculations are terminated. See *Figure 25.21* (p. 1052).

user-defined
specifies a user-defined function to define the discrete phase boundary condition type.

Boundary Cond. Function
sets the user-defined function from the drop-down list.

Discrete Phase Reflection Coefficients
determine the behavior of reflecting particles. This item appears when **reflect** is chosen as the **Boundary Cond. Type**. See *Discrete Phase Boundary Condition Types* (p. 1052) for details on setting the following items.

Normal
sets the type of function for the normal coefficient of restitution. This function can be **constant**, **piecewise-linear**, **piecewise-polynomial**, or **polynomial**.

Tangent
sets the type of function for the tangential coefficient of restitution. This function can be **constant**, **piecewise-linear**, **piecewise-polynomial**, or **polynomial**.

Erosion Model
contains inputs for erosion calculations. See *Discrete Phase Boundary Condition Types* (p. 1052) for details about these items.

Impact Angle Function
specifies the value of $f(\alpha)$ in Equation 16–205 in the Theory Guide.

Diameter Function
specifies the value of $C\left(d_p\right)$ in Equation 16–205 in the Theory Guide.

Velocity Exponent Function
specifies the value of $b(v)$ in Equation 16–205 in the Theory Guide.

UDS
displays the boundary conditions for user-defined scalars (UDSs) at the wall. This tab is available only if you have specified a non-zero number of user-defined scalars in the *User-Defined Scalars Dialog Box* (p. 2113).

User Defined Scalar Boundary Condition
contains options for the specification of UDS boundary conditions. See the separate UDF Manual for details.

Specified Flux
indicates that the flux of the UDS at the wall will be specified.

Specified Value
indicates that the value for the UDS at the wall will be specified.

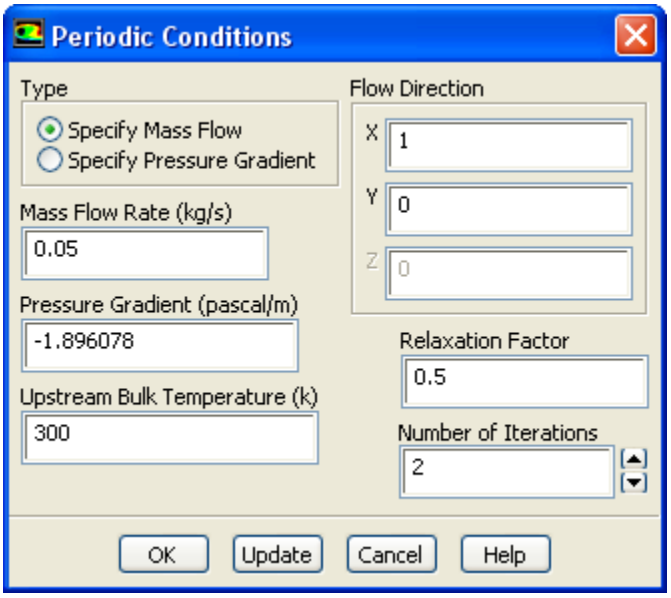
User Defined Scalar Boundary Value
contains inputs for the value of the flux of the UDS, or the value of the UDS itself, depending on your selection for that UDS under **User Defined Scalar Boundary Condition**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.7.21. Periodic Conditions Dialog Box

The **Periodic Conditions** dialog box allows you to set parameters that define fully-developed periodic flow and heat transfer. See *User Inputs for the Pressure-Based Solver* (p. 494) and *Using Periodic Heat Transfer* (p. 765) for details.

(This dialog box is available only when the pressure-based solver is used; it is not available for the density-based coupled solvers.)



Controls

Specify Mass Flow
enables the specification of the mass flow rate.

Specify Pressure Gradient
enables the specification of the pressure gradient.

Mass Flow Rate
specifies the mass flow rate. This item will not be available if you selected the **Specify Pressure Gradient** option.

Important

For axisymmetric problems, the mass flow rate is per 2π radians.

Pressure Gradient
specifies the pressure gradient (β in Equation 1–22 in the Theory Guide).

Upstream Bulk Temperature
sets the inlet bulk temperature for periodic heat transfer calculations.

Flow Direction
sets the direction of the periodic flow. The direction vector must be parallel to the periodic translation direction or its opposite.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Relaxation Factor

sets the under-relaxation factor that controls convergence of the iteration process described in *Setting Parameters for the Calculation of β* (p. 496) for specified mass flow.

Number of Iterations

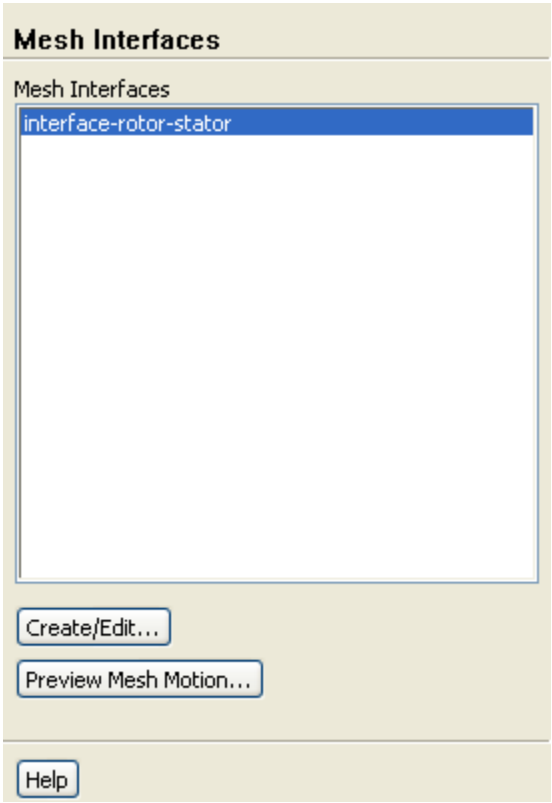
sets the number of subiterations done on the correction of β in the pressure correction equation for specified mass flow. See *Setting Parameters for the Calculation of β* (p. 496) for details.

Update

updates the **Pressure Gradient** field with the current value.

35.8. Mesh Interfaces Task Page

The **Mesh Interfaces** task page allows you to define the parameters for any mesh interfaces in your model.



Controls

Mesh Interfaces

contains a list of mesh interfaces.

Create/Edit...

displays the *Create/Edit Mesh Interfaces Dialog Box* (p. 1876).

Preview Mesh Motion...

displays the *Mesh Motion Dialog Box* (p. 1896).

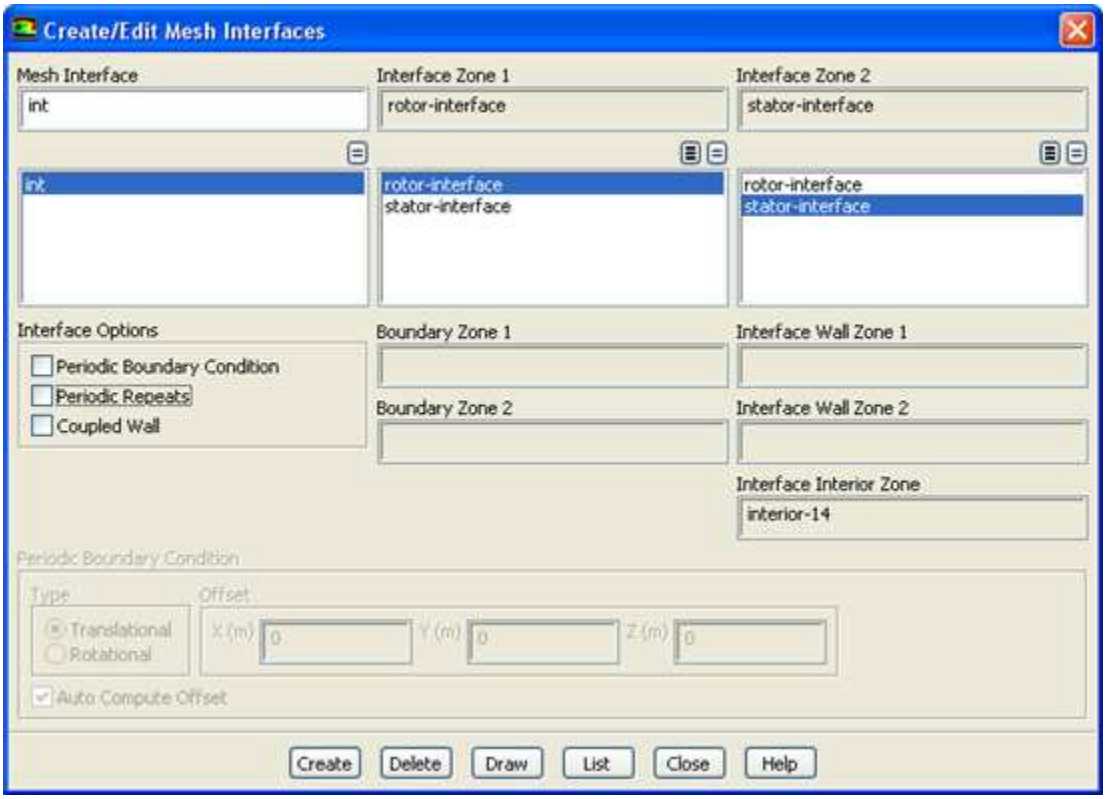
For additional information, please see the following section:

35.8.1. Create/Edit Mesh Interfaces Dialog Box

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.8.1. Create/Edit Mesh Interfaces Dialog Box

The **Create/Edit Mesh Interfaces** dialog box allows you to define mesh interfaces for use with sliding meshes (see *Using Sliding Meshes* (p. 540)) or multiple reference frames (see *Mesh Setup for a Multiple Moving Reference Frame* (p. 524)), or for meshes with non-conformal boundaries (see *Non-Conformal Meshes* (p. 161)).



Controls

Mesh Interface

contains a text entry box in which you can set the name of the mesh interface, and a list from which you can select an existing mesh interface.

Interface Zone 1, Interface Zone 2

contain lists from which you can select the two interface zones that comprise the mesh interface, and informational fields that show the name of the zone you selected in each list. (You cannot edit these fields; the name in this field will be the name of the zone you selected in the list below it.)

Interface Options

contains options related to the interface type.

Periodic Boundary Condition

allows you to create a non-conformal periodic boundary condition interface.

Periodic Repeats

is relevant when you have two zones coming together, such as a rotor and stator. When the two zones move, a portion of the geometry will intersect and that will be an interior zone, but on either side of the interior, the zone is termed periodic repeats.

Coupled Wall

indicates (if enabled) that the interface acts as a thermally coupled wall.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Boundary Zone 1, Boundary Zone 2
display the names of the wall boundary zones that ANSYS FLUENT creates during the creation of a non-periodic mesh interface. If the two interface zones overlap each other, then the wall boundaries are created but with zero faces.

Interface Interior Zone
displays the names of the interface interior zones created. This is used for embedded LES, when there is a need to be able to convert an interior zone into a RANS-LES interface.

Interface Wall Zone 1, Interface Wall Zone 2
display the names of the wall interface zones (e.g., `wall-4`, `wall-4-shadow`), which are created if the **Coupled Wall** option is enabled.

Periodic Boundary Condition

Type
allows you to select a periodicity that is either **Translational** or **Rotational**.

Offset
is the offset coordinates or angle, depending on whether **Translational** or **Rotational** periodicity is selected. Note that when **Auto Compute Offset** is enabled, the **Offset** fields are not editable.

Auto Compute Offset
will result in ANSYS FLUENT finding the offset. If this option is disabled, then you will have to provide the offset coordinates or angle in the required fields, depending on whether **Translational** or **Rotational** periodicity is selected.

Create
creates the specified mesh interface (and gives it the name specified under **Mesh Interface**).

Delete
deletes the mesh interface selected under **Mesh Interface**.

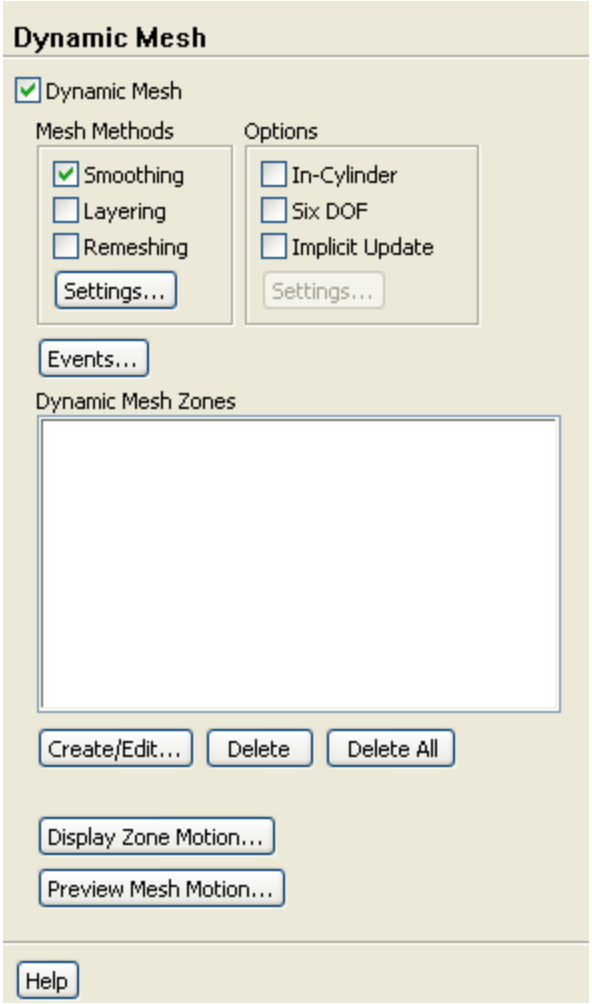
Draw
allows you to display interface zones or mesh interfaces in the graphics window. Note that you can only select and display interface zones from **Interface Zone 1** or Interface Zone 2 prior to defining any **Mesh Interfaces**. After a **Mesh Interface** is defined, you can select the appropriate mesh interface and click the **Draw** button to display the zones under **Interface Zone 1** and Interface Zone 2 together as defined by the **Mesh Interface**.

List
lists information about the selected **Mesh Interface**. When you click on this button, ANSYS FLUENT will report (in the console window) the two interface boundaries and all new zones that were created (i.e., interior, wall, or periodic zones).

35.9. Dynamic Mesh Task Page

The **Dynamic Mesh** task page allows you to define the all the parameters for modeling a dynamic mesh model. See *Setting Dynamic Mesh Modeling Parameters* (p. 550) for details about using the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Dynamic Mesh

enables the dynamic mesh model and activates the controls in the task page.

Mesh Methods

contains options to specify the mesh update method(s).

Smoothing

enables the spring-based or diffusion-based smoothing methods. In spring-based smoothing, edges between any two mesh nodes are idealized as a network of interconnected springs. In diffusion-based smoothing, the interior mesh motion is governed by the solution to a diffusion problem. See *Spring-Based Smoothing* (p. 552) for details.

Layering

enables the dynamic layering method which can be used to add or remove layers of cells adjacent to a moving boundary based on the height of the layer adjacent to the moving surface in prismatic mesh zones. See *Dynamic Layering Method* (p. 564) for details.

Remeshing

enables the local or zonal remeshing methods. In local remeshing, the cells that violate the skewness or size criteria are agglomerated and locally remeshed; see *Local Remeshing Method* (p. 570) for further details. In zonal remeshing, the complete cell zone (including the boundary zones) is remeshed; see *CutCell Zone Remeshing Method* (p. 579) for further details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Settings...
displays the *Mesh Method Settings Dialog Box* (p. 1879).

Options
contains options to specify specialized dynamic mesh models.

In-Cylinder
enables the in-cylinder model. See *In-Cylinder Settings* (p. 587) for more information.

Six DOF
enables six degrees of freedom solver. See *Using the Six DOF Solver* (p. 602) for more information.

Implicit Update
specifies that the mesh is updated during a time step (as opposed to just at the beginning of a time step). See *Implicit Update Settings* (p. 603) for more information.

Settings...
opens the *Options Dialog Box* (p. 1883), where you can set the parameters for the options that are enabled in the **Options** group box.

Events...
displays the *Dynamic Mesh Events Dialog Box* (p. 1886).

Dynamic Mesh Zones
displays a list of dynamic mesh zones.

Create/Edit...
displays the *Dynamic Mesh Zones Dialog Box* (p. 1889).

Delete
removes the selected dynamic zone(s) from the **Dynamic Mesh Zones** list.

Delete All
removes all dynamic zones from the **Dynamic Mesh Zones** list.

Display Zone Motion...
displays the *Zone Motion Dialog Box* (p. 1895).

Preview Mesh Motion...
displays the *Mesh Motion Dialog Box* (p. 1896).

For additional information, please see the following sections:

35.9.1. Mesh Method Settings Dialog Box
35.9.2. Mesh Scale Info Dialog Box
35.9.3. Options Dialog Box

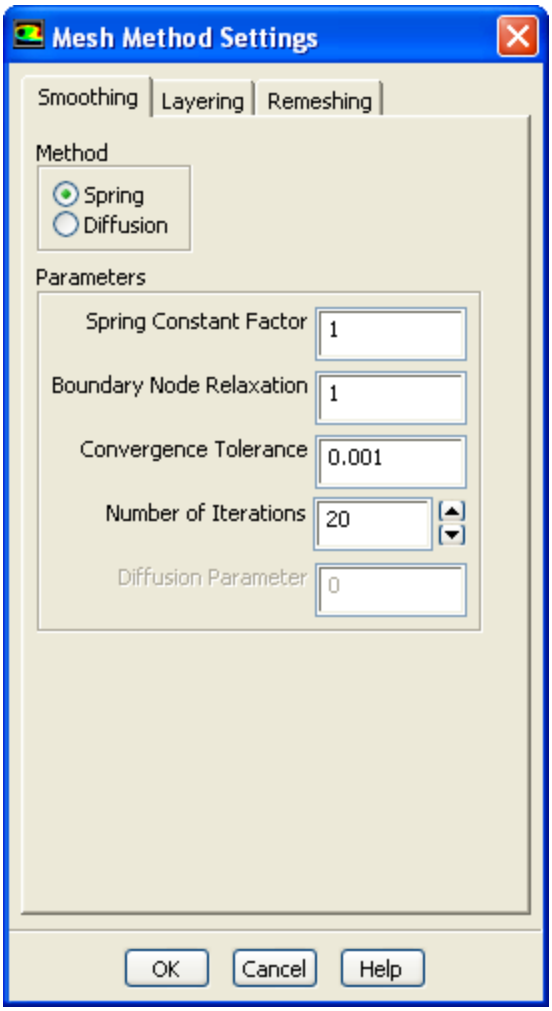
35.9.6. Define Event Dialog Box
35.9.7. Events Preview Dialog Box
35.9.8. Dynamic Mesh Zones Dialog Box
35.9.9. CutCell Boundary Zones Info Dialog Box
35.9.10. Zone Scale Info Dialog Box
35.9.11. Zone Motion Dialog Box
35.9.12. Mesh Motion Dialog Box
35.9.13. Autosave Case During Mesh Motion Preview Dialog Box

35.9.1. Mesh Method Settings Dialog Box

The **Mesh Method Settings** dialog box allows you to apply settings for the smoothing, layering, or remeshing methods.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Smoothing

contains parameters to be specified for the smoothing mesh update method.

Method

gives you a choice of using spring-based or diffusion-based smoothing.

Spring

selects the spring-based smoothing method.

Diffusion

selects the diffusion-based smoothing method.

Spring Constant Factor

controls the spring stiffness.

Boundary Node Relaxation

specifies how the node positions on the deforming boundaries are updated. This applies only if your model contains deforming boundaries.

Convergence Tolerance

controls the smoothing convergence.

Number of Iterations

specifies the number of iterations.

Diffusion Parameter

specifies α.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Layering

contains parameters to be specified for the layering mesh update method.

Options

specifies the criteria for splitting or collapsing cell layers.

Height Based

specifies that the cell layers are split or merged based on height.

Ratio Based

specifies that the cell layers are split or merged based on ratios.

Split Factor

specifies the value of α_s in*Equation 11–14* (p. 565). It controls the height or ratio at which the cells are split.

Collapse Factor

specifies the value of α_c in *Equation 11–15* (p. 566). It controls the height or ratio at which the cells are collapsed and merged into the next layer.

Remeshing

contains parameters to be specified for the remeshing mesh update method.

Remeshing Methods

contain options that control remeshing.

Local Cell

allows you to remesh deforming boundary cells.

Local Face

allows you to remesh deforming boundary faces. This option is available for 3D cases.

Region Face

allows you to remesh a region.

CutCell Zone

allows you to replace an entire cell zone with a predominantly Cartesian mesh. This option is only available for 3D cases. Note that the parameters that control this remeshing method are set in the **Dynamic Mesh Zones** dialog box. See *Using the CutCell Zone Remeshing Method* (p. 581) for more information.

2.5D

enables the 2.5D model. This option is only available for 3D cases. See *Using the 2.5D Model* (p. 583) for more information.

Parameters

contains parameters that control remeshing for all of the remeshing methods except for **CutCell Zone**.

Minimum Length Scale

specifies the lower limit of cell size below which the cells are marked for remeshing.

Maximum Length Scale

specifies the upper limit of cell size above which the cells are marked for remeshing.

Maximum Cell Skewness

specifies the desired maximum skewness for the mesh.

Maximum Face Skewness

specifies the desired maximum skewness for the surface mesh. This option is active, when **Local Face** is selected under **Remeshing Methods**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Size Remeshing Interval
specifies the interval in time steps for remeshing based on the above size criteria only. Marking of cells based on skewness occurs automatically at every time step when **Remeshing** is enabled.

Mesh Scale Info...
opens the *Mesh Scale Info Dialog Box* (p. 1882), in which you can view the statistics of the mesh, such as the minimum and maximum length scale values and the maximum cell and face skewness values.

Use Defaults
resets the remeshing parameters to the default values.

Sizing Function
contains parameters that control the sizing function.

On
allows you to enable or disable the sizing function.

Resolution
sets the resolution for the sizing function. See *Setting Dynamic Mesh Modeling Parameters* (p. 550) for more information. This item will appear only if **Sizing Function** is enabled.

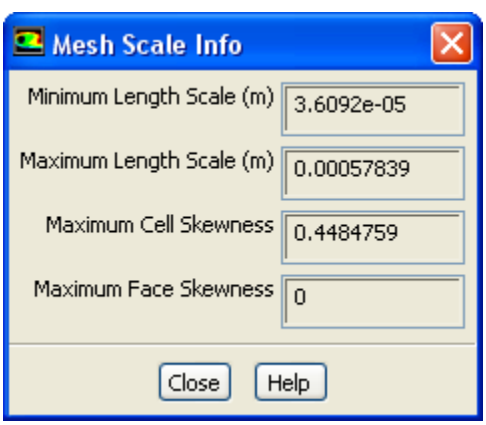
Variation
specifies the value of α in *Equation 11–21* (p. 575). This item will appear only if **Sizing Function** is enabled.

Rate
specifies the value of β in *Equation 11–22* (p. 575). This item will appear only if **Sizing Function** is enabled.

Use Defaults
resets the sizing function parameters to the default values. This item will appear only if **Sizing Function** is enabled.

35.9.2. Mesh Scale Info Dialog Box

The **Mesh Scale Info** dialog box allows you to inspect the values of minimum and maximum length scale and maximum cell/face skewness in a mesh.



Controls

Minimum Length Scale
displays the lower limit of cell size below which the cells are marked for remeshing.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

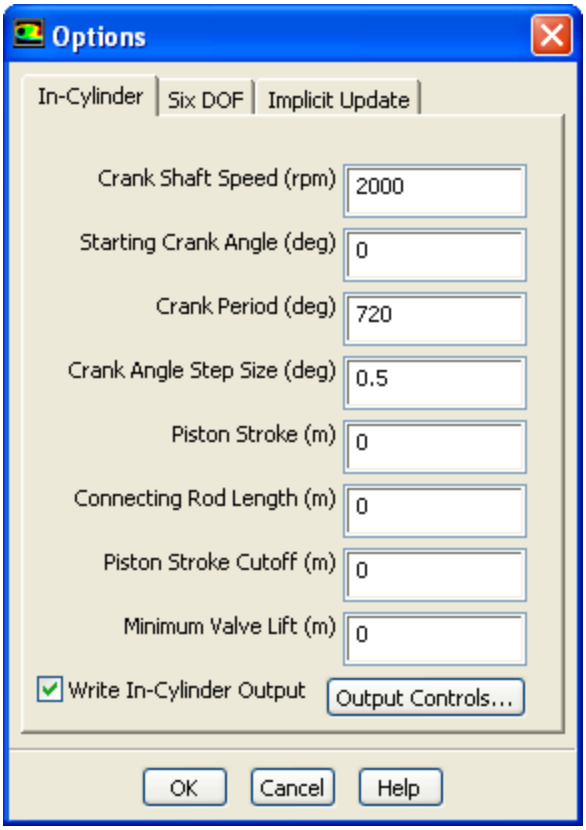
Maximum Length Scale
displays the upper limit of cell size below which the cells are marked for remeshing.

Maximum Cell Skewness
displays the maximum cell skewness in the zone.

Maximum Face Skewness
displays the maximum cell skewness in the surface mesh.

35.9.3. Options Dialog Box

The **Options** dialog box allows you to set the parameters for the options available in the **Options** group box of the **Dynamic Mesh** task page.



In-Cylinder
contains parameters to be specified for the in-cylinder model. See *In-Cylinder Settings* (p. 587) for more information.

Crank Shaft Speed
specifies the speed of the crank shaft.

Starting Crank Angle
specifies the starting crank angle.

Crank Period
specifies the crank period.

Crank Angle Step Size
specifies the crank angle step size used to determine the time step size to advance the solution.

Piston Stroke
specifies the piston stroke to calculate the piston location.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Connecting Rod Length
specifies the length of the connecting rod.

Piston Stroke Cutoff
specifies the piston stroke cutoff used to control the onset of layering in the cylinder chamber.

Minimum Valve Lift
specifies the minimum valve lift.

Write In-Cylinder Output
enables or disables the writing of in-cylinder specific output parameters. When this option is enabled, the **Output Controls...** button becomes active.

Output Controls...
displays the *In-Cylinder Output Controls Dialog Box* (p. 1884) and is available only after the **Write In-Cylinder Output** option is enabled.

Six DOF
contains parameters to be specified for the six DOF solver. See *Six DOF Solver Settings* (p. 601) for more information.

Gravitational Acceleration
contains the text entry boxes for gravitational acceleration in X, Y, and Z directions.

X, Y, Z
specifies the gravitational acceleration in X, Y, and Z directions respectively.

Write Motion History
allows you to keep track of an object's motion history.

File Name
allows you to specify a file name for saving the object's motion history.

Implicit Update
contains parameters to be specified for implicit mesh updating. See *Implicit Update Settings* (p. 603) for more information.

Update Interval
allows you to specify the frequency in iterations at which the mesh will be updated within a time step.

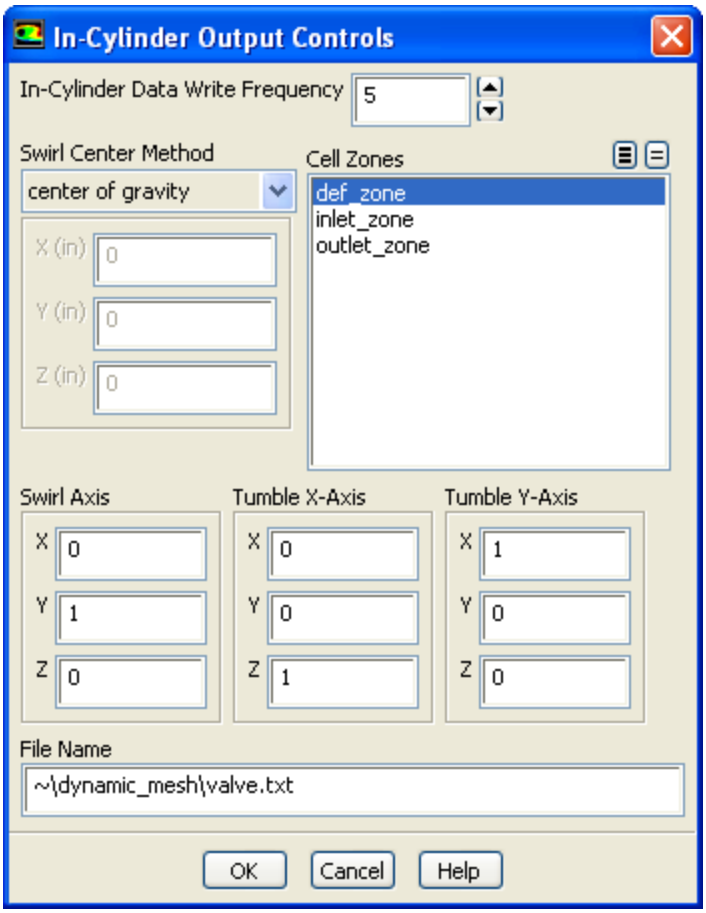
Motion Relaxation
allows you to set a value (within the range of 0 to 1) for ω in *Equation 11–28* (p. 604), which defines the relaxation of the motion (i.e., displacement of the nodes) during the mesh update.

Residual Criteria
allows you to set the relative residual threshold that is used to check the motion convergence.

35.9.4. In-Cylinder Output Controls Dialog Box

The **In-Cylinder Output Controls** dialog box contains parameters that control the output for the in-cylinder model. See *In-Cylinder Settings* (p. 587) for more information.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

In-Cylinder Data Write Frequency

represents an integer entry specifying the interval in number of time-steps. Make sure that a value other than 0 is used for the frequency, in order to allow you to complete your setup.

Swirl Center Method

contains a drop-down list which allows you to select the method to calculate the swirl center. The list contains **center of gravity** and **fixed**, with **center of gravity** being the default value.

center of gravity

calculates the swirl center inside the code and is used as the center of gravity of the chosen cell zones.

fixed

enables you to specify a swirl center in the **X**, **Y**, and **Z** entry fields below the drop-down list.

In addition to these two options, you can chose to use your own **Compiled** UDF to calculate the swirl center. For details on using a dynamic mesh UDF, see the separate for information on user-defined functions.

Cell Zones

is a list which displays the names of all existing cell zones in the case files. You can select only the zones relevant for the swirl and tumble calculations.

Swirl Axis

specifies the swirl axis with three entries for the directional components. By default, **X**, **Y**, **Z**= **0**, **1**, **0**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Tumble X-Axis

specifies the directional components of **Tumble X-Axis** in **X**, **Y**, **Z** directions. By default, **X**, **Y**, **Z** = **0**, **0**, **1**. This applies only in 3D.

Tumble Y-Axis

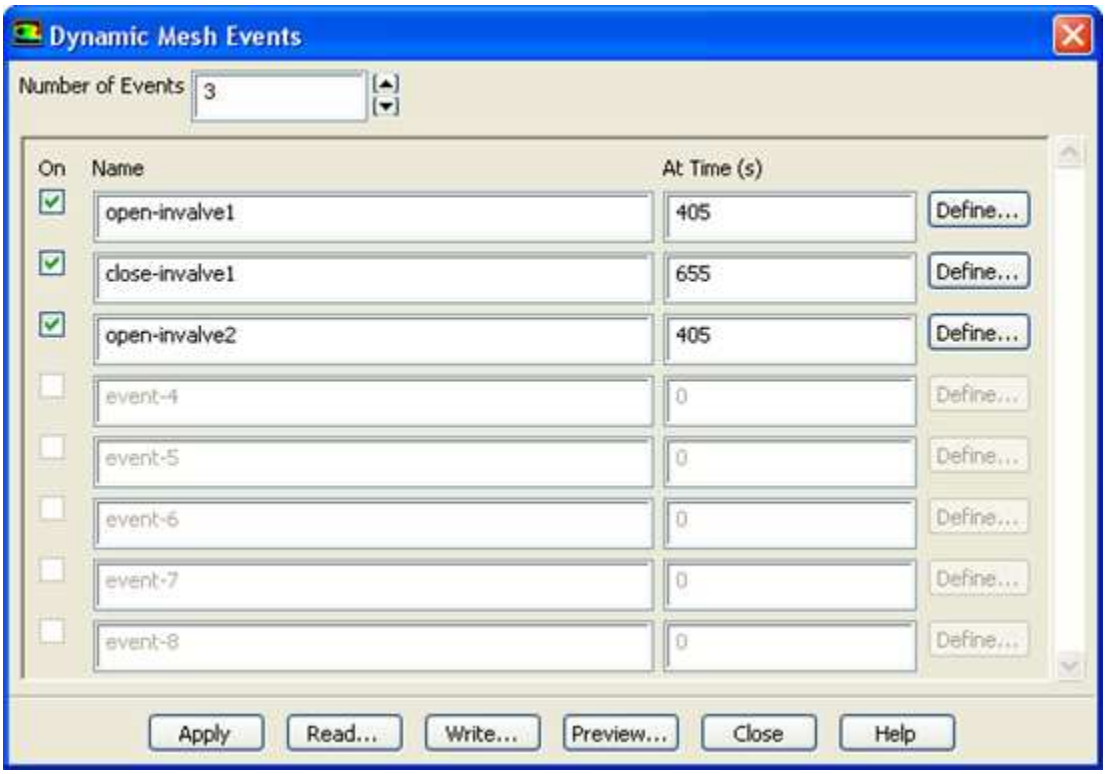
specifies the directional components of **Tumble Y-Axis** in **X**, **Y**, **Z** directions. By default, **X**, **Y**, **Z** = **1**, **0**, **0**. This applies only in 3D.

File Name

specifies the name of the **In-Cylinder** output file. By default, the file name contains the name of the case file appended with a `.txt` extension.

35.9.5. Dynamic Mesh Events Dialog Box

The **Dynamic Mesh Events** dialog box is available to control the timing of specific events during the course of the simulation. See *Defining Dynamic Mesh Events* (p. 605) for details.



Controls

Number of Events

specifies the number of events to be defined.

On

enables the corresponding event.

Name

specifies the name of the event.

At Crank Angle

specifies the angular location of the crank at which the event should occur. This option appears for in-cylinder flows.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

At Time
specifies the time (in seconds) at which you want the event to occur. This option appears for non-in-cylinder flows.

Define...
opens the *Define Event Dialog Box* (p. 1887).

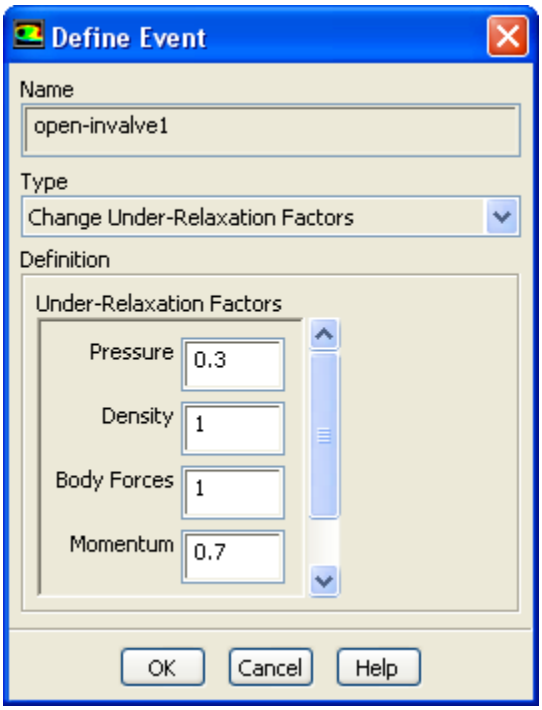
Read...
opens *The **Select File** Dialog Box* (p. 33).

Write...
opens *The **Select File** Dialog Box* (p. 33).

Preview...
opens the *Events Preview Dialog Box* (p. 1889).

35.9.6. Define Event Dialog Box

The **Define Event** dialog box allows you to define events.



Controls

Name
contains the name of the event to be defined.

Type
specifies the type of event. You can choose the type of event from the drop-down list. These event types and their definitions are described in *Events* (p. 608).

Definition
contains the input parameters corresponding to the type of event selected under **Type**.

Zone
contains a selectable list of the zones. The selection specifies the name of the zone(s) to be changed. This item will appear only for the **Change Zone Type** event.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

New Zone Type
specifies the type of zone that an existing zone needs to be changed to. This item will appear only for the **Change Zone Type** event.

From Zone
specifies the name of the zone from which the boundary condition is to be copied. This item will appear only for the **Copy Zone BC** event.

To Zone(s)
specifies the name of the zone to which the boundary condition is to be copied. This item will appear only for the **Copy Zone BC** event.

Zone(s)
contains a selectable list of the zones. The selection specifies the name of the zone to be activated / deactivated. This item will appear only for the **Activate Cell Zone** and **Deactivate Cell Zone** events.

Interface Name
contains the name of the interface to be created or deleted. This item will appear only for the **Create Sliding Interface** and **Delete Sliding Interface** events.

Interface Zone 1, Interface Zone 2
specifies the two zones on either side of the interface to be created. This item will appear only for the **Create Sliding Interface** event.

Wall 1 Motion, Wall 2 Motion
specifies the dynamic zones whose motion can be copied for the zones specified under **Interface Zone 1** and **Interface Zone 2**. This item will appear only for the **Create Sliding Interface** event.

Attribute
allows you to select the relevant motion attribute. This item will appear only for the **Change Motion Attribute** event.

Status
allows you to enable or disable the motion attribute. This item will appear only for the **Change Motion Attribute** event.

Dynamic Mesh Zones
contains a list of dynamic zones. This item will appear only for the **Change Motion Attribute** event.

Crank Angle Step Size
specifies the new physical time step value in degrees. This item will appear only for the **Change Time Step Size** event.

Base Dynamic Zone
specifies the zone from which the layer of cells is to be created. This item will appear only for the **Insert Boundary Layer**and **Remove Boundary Layer** event.

Side Dynamic Zone
represents the deforming face zone adjacent to the **Base Dynamic Zone** before the layer is inserted. This item will appear only for the **Insert Boundary Layer** event.

Internal Zone 1 Name, Internal Zone 2 Name
specifies the name of the new internal zones.

Time Step Size
allows you to change the time step size of the event. This item will appear only for the **Change Time Step Size** event.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Under-Relaxation Factors
allows you to specify the under-relaxation factors for the selected event. This item will appear only for the **Change Under-Relaxation Factors** event. See *Setting Under-Relaxation Factors* (p. 1217) for details.

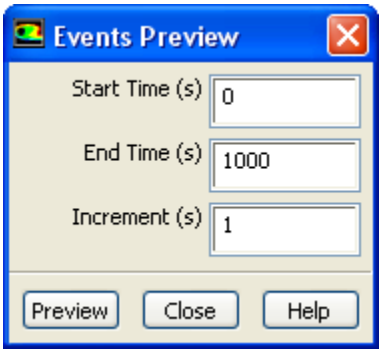
Adjacent Dynamic Face Zone
allows you to select the dynamic face zone adjacent to the location of the cell layer to be inserted (or deleted). You can select the required zone from the drop-down list.

Direction Parameter
is the direction with respect to the selected dynamic face zone a layer of cells is removed or added.

Command
specifies the series of text / Scheme commands or the macro to be executed during the simulation. This item will appear only for the **Execute Command** event.

35.9.7. Events Preview Dialog Box

The **Events Preview** dialog box allows you to play the events to check that they are defined correctly.



Controls

Start Crank Angle
specifies the crank angle at which you want to start the preview (for in-cylinder flows).

Start Time
specifies the time at which you want to start the preview (for non-in-cylinder flows).

End Crank Angle
specifies the crank angle at which you want to end the preview (for in-cylinder flows).

End Time
specifies the time at which you want to end the preview (for non-in-cylinder flows).

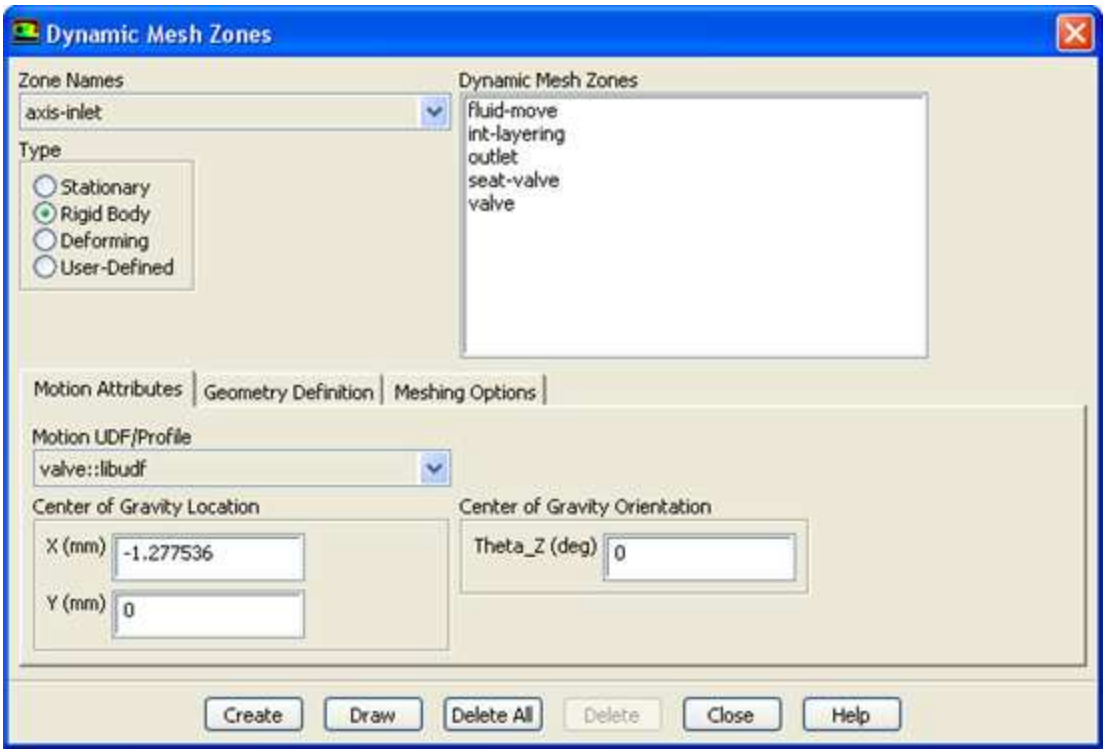
Increment
specifies the size of the step to take during the preview.

Preview
plays back the events at the crank angle specified for each event and reports when each event occurs in the text (console) window.

35.9.8. Dynamic Mesh Zones Dialog Box

The **Dynamic Mesh Zones** dialog box allows you to specify the motion of the dynamic zones in your model. See *Specifying the Motion of Dynamic Zones* (p. 613) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zone Names

contains the names of the zones in the model.

Type

contains the types of motion that can be specified for a dynamic zone.

Stationary

explicitly declares the zone as stationary, so that the nodes on this zone are excluded when updating the node positions. See *Specifying the Motion of Dynamic Zones* (p. 613) for more information.

Rigid Body

specifies the zone as having a rigid-body motion.

Deforming

specifies the zone as deforming.

User-Defined

enables you to specify a user-defined zone motion.

Dynamic Mesh Zones

lists all of the dynamic zones in the case.

Motion Attributes

contains parameters to specify the motion attributes for a rigid-body-motion zone and a user-defined-motion zone.

Motion/UDF Profile

specifies the motion of the rigid body zone by selecting a profile or user-defined function from the See *Profiles* (p. 366) and *Solid-Body Kinematics* (p. 623) for information on profiles, and see the UDF Manual for information on user-defined functions.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Six DOF UDF

specifies the motion of a rigid body zone by selecting a profile or user-defined function from the drop-down list. This option is available only if the **Six DOF** solver is the selected model.

Six DOF Options
contains parameters for the six DOF solver.

On
enables the use of the six DOF solver.

Passive
(if enabled) does not take forces and moments on the zone into consideration.

Center of Gravity Location
contains the current values of the coordinates for the location of the C.G. of the selected zone. This item will appear only if the motion **Type** is **Rigid Body**, if **In-Cylinder** is not enabled in the **Dynamic Mesh Parameters** dialog box.

Center of Gravity Orientation
contains the current values of the coordinates for the orientation defined at the C.G. of the selected zone. This item will appear only if the motion **Type** is **Rigid Body**, if **In-Cylinder** is not enabled in the **Dynamic Mesh Parameters** dialog box.

Center of Gravity Velocity

specifies the velocity of the center of gravity with respect to inertia coordinate system. This option is available only if the **Six DOF** solver is the selected model.

Center of Gravity Angular Velocity

specifies the angular velocity of the center of gravity with respect to inertia coordinate system. This option is available only if the **Six DOF** solver is the selected model.

Lift/Stroke
contains the current value of valve lift or piston stroke which is automatically updated when you click **Create**. This item will appear only if **In-Cylinder** is enabled in the **Dynamic Mesh Parameters** dialog box.

Valve/Position Axis
specifies the direction of the reference axis of the valves or piston for an in-cylinder problem. This item will appear only if **In-Cylinder** is enabled in the **Dynamic Mesh** task page.

Mesh Motion UDF
allows you to select the user-defined function that defines the geometry and motion of the zone. This item will appear only if the motion **Type** is **User-Defined**.

Geometry Definition
contains parameters to define a deforming zone.

Definition
allows you to select a geometry definition to project nodes of the deforming zone on. Available options are **faceted**, **plane**, **cylinder**, and **user-defined**.

Feature Detection
allows you to preserve features on deforming zones between the different face zones and within a face zone.

Include Features
includes features of a specific angle.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Feature Angle
specifies feature angle in degrees.

Point on Plane
allows you to specify the position of a point on the plane. This item will appear only when you select **plane** for the **Definition**.

Plane Normal
allows you to specify the direction of the plane normal. This item will appear only when you select **plane** for the **Definition**.

Cylinder Radius
allows you to specify the radius of the cylinder. This item will appear only when you select **cylinder** for the **Definition**.

Cylinder Origin
allows you to specify the location of the cylinder origin. This item will appear only when you select **cylinder** for the **Definition**.

Cylinder Axis
allows you to specify the direction of the cylinder axis. This item will appear only when you select **cylinder** for the **Definition**.

Geometry UDF
allows you to select a user-defined function for a geometry **Definition**.

Meshing Options
contains parameters for various meshing options.

Adjacent Zone
contains the name of the adjacent zone that is involved in local remeshing or dynamic layering. This item will appear only if the zone type is **Stationary**, **Rigid Body**, or **User-Defined**, and if the zone is not the boundary of a CutCell dynamic cell zone.

Cell Height
allows you to specify the ideal height of the adjacent cells as either a constant value or a compiled user-defined function. This item will appear only if the motion **Type** is **Stationary**, **Rigid Body**, or **User-Defined**, and if the zone is not the boundary of a CutCell dynamic cell zone.

Methods
contains options to specify the mesh update method(s) and controls on a zone by zone basis. These options and parameters will override those that you specified globally in the **Dynamic Mesh** task page. This item will appear only if the motion **Type** is **Deforming**.

Smoothing
enables the smoothing mesh update method.

Layering
enables the layering mesh update method (valid for a prismatic cell zone only). This item will appear only if the zone you are defining is a cell (fluid) zone.

Remeshing
enables the remeshing mesh update method.

Zone Parameters
contains a set of remeshing criteria, other than those you specified globally in the **Mesh Method Settings** dialog box. Note that this group box is not available if the **CutCell** option in the **Remeshing Options** group box is enabled.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Minimum Length Scale
allows you to specify the minimum length scale for the zone. This item will appear only if the zone you are defining is a cell (fluid) zone.

Maximum Length Scale
allows you to specify the maximum length for the zone. This item will appear only if the zone you are defining is a cell (fluid) zone.

Maximum Skewness
allows you to specify the desired value for maximum skewness.

Zone Scale Info...
opens the *Zone Scale Info Dialog Box* (p. 1894), in which you can view the statistics of the mesh, such as minimum, maximum, and average length scale values, as well as the maximum skewness.

CutCell Zone Parameters
contains a set of global parameters used for CutCell zone remeshing. This group box will only appear if the zone selected in the **Dynamic Mesh Zones** list is a cell zone, and if the **CutCell** option is enabled in the **Remeshing Options** group box.

Maximum Mesh Size
allows you to specify the maximum mesh size of the Cartesian CutCell mesh.

Growth Rate
allows you to specify the default growth rate used for mesh refinement by size functions. This growth rate is used during remeshing by the mesh-based size functions of all boundaries of the CutCell cell zone that are not defined as dynamic mesh zones.

Minimum Orthogonal Quality
allows you to specify the minimum allowable orthogonal quality for the cell zone. CutCell remeshing will occur if the orthogonal quality for any cell in the cell zone drops below this value.

Remeshing Interval
specifies the interval of time steps at which the cell zone remeshing will take place, even if the mesh quality has not deteriorated below the value entered for **Minimum Orthogonal Quality**. Enter a value of `0` for the **Remeshing Interval** if you want the remeshing to occur only if there is insufficient mesh quality.

Boundary Zones Info...
opens the *CutCell Boundary Zones Info Dialog Box* (p. 1894), which lists all of the boundary zones for the CutCell dynamic cell zone, along with the remeshing parameters.

Zone Scale Info...
opens the *Zone Scale Info Dialog Box* (p. 1894), in which you can view the statistics of the mesh, such as minimum, maximum, and average length scale values, as well as the maximum skewness.

CutCell Boundary Zone Parameters
contains a set of global parameters used for CutCell zone remeshing. This group box will only appear if the zone selected in the **Dynamic Mesh Zones** list is a boundary of a CutCell dynamic cell zone.

Maximum Mesh Size
allows you to specify the maximum mesh size used by the soft size function. If a value of `0` is entered, a mesh-based size function is used to locally refine the Cartesian mesh near the boundary.

Growth Rate
allows you to specify the local growth rate used by the size function.

Zone Scale Info...
opens the *Zone Scale Info Dialog Box* (p. 1894), in which you can view the statistics of the mesh, such as minimum, maximum, and average length scale values, as well as the maximum skewness.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Smoothing Methods

contains two methods of smoothing. This option is not available if diffusion-based smoothing has been selected in the **Mesh Method Settings** dialog box.

Spring

enables spring-based smoothing method.

Laplace

enables Laplacian smoothing method.

Remeshing Methods

contains two methods of remeshing.

Region

enables region-based remeshing method.

Local

enables local remeshing method.

Remeshing Options

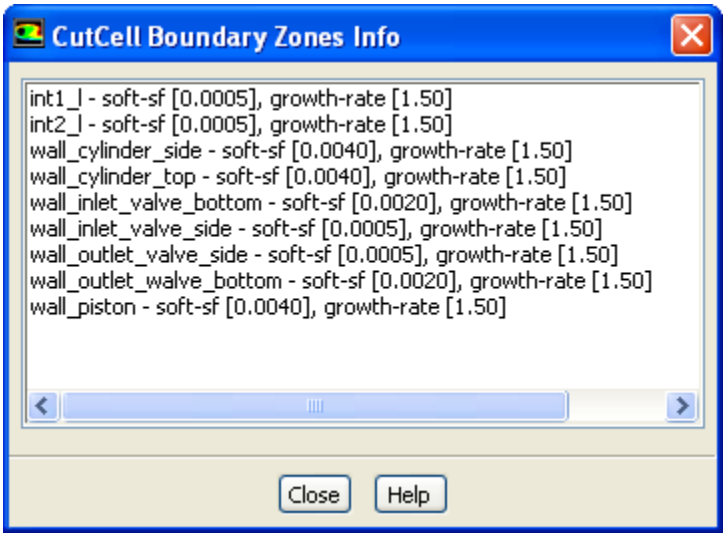
contains one method of remeshing.

CutCell

enables the CutCell zone remeshing method. This option is only available when the **CutCell Zone** is enabled in the **Mesh Method Settings** dialog box, and if the zone selected in the **Dynamic Mesh Zones** list of the **Dynamic Mesh Zones** dialog box is a cell zone.

35.9.9. CutCell Boundary Zones Info Dialog Box

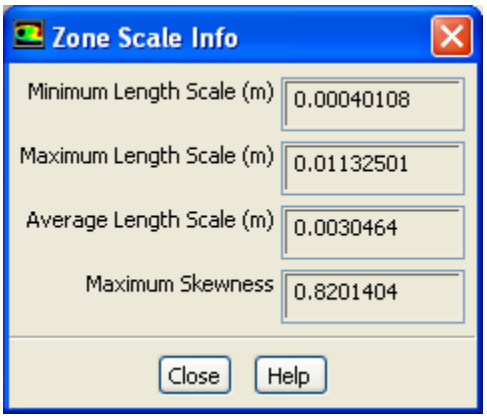
The **CutCell Boundary Zones Info** dialog box displays a list of all of the boundary zones for the CutCell dynamic cell zone. This list also provides the remeshing parameters for the zones, including size function type, the maximum mesh size, and the growth rate used to refine the mesh at all of the CutCell boundaries.



35.9.10. Zone Scale Info Dialog Box

The **Zone Scale Info** dialog box allows you to inspect the values of minimum and maximum cell area or volume, and maximum cell skewness in a zone.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Maximum Length Scale
displays the maximum cell length in the zone.

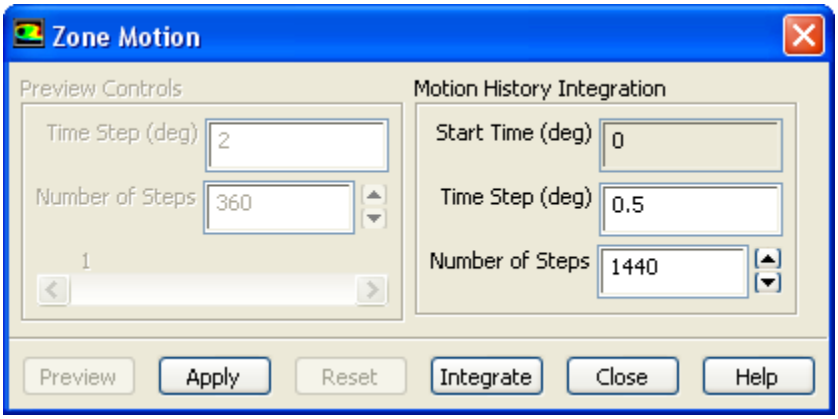
Minimum Length Scale
displays the minimum cell length in the zone.

Average Length Scale
displays the average cell length in the zone.

Maximum Skewness
displays the maximum cell skewness in the zone.

35.9.11. Zone Motion Dialog Box

The **Zone Motion** dialog box will update those zones that have solid body motion specified, in the graphics window. See *Previewing the Dynamic Mesh* (p. 626) for details about the items below.



Controls

Preview Controls
contains controls that you can set to preview the zone motion.

Time Step
specifies time step size for zone motion preview.

Number of Steps
specifies number of time steps for zone motion preview.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Motion History Integration
contains motion history integration parameters.

Start Time
is the starting time for mesh motion (default value set to 0).

Time Step
specifies the time step size in seconds.

Number of Steps
allows you to specify the number of time steps for the motion.

Preview
previews the zone motion.

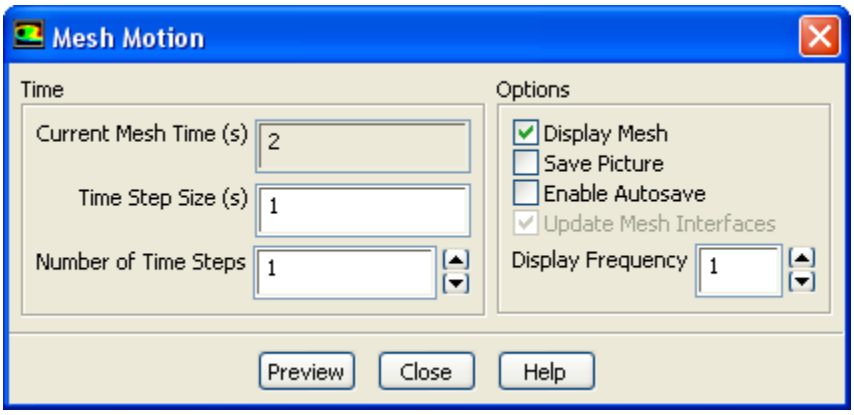
Apply
saves your settings for zone motion.

Reset
sets the default inputs restored in the dialog box.

Integrate
allows ANSYS FLUENT to create a table of surface positions in time.

35.9.12. Mesh Motion Dialog Box

The **Mesh Motion** dialog box allows you to preview the dynamic mesh as it changes with time before you start your simulation. See *Previewing the Dynamic Mesh* (p. 626) for details.



Controls

Time
contains the parameters to specify the time interval at which to update the mesh.

Current Mesh Time
displays the current time after the dynamic mesh has been advanced the specified number of steps.

Time Step Size
specifies the size of each time step.

Number of Time Steps
specifies the number of time steps.

Options
contains options to view the updated mesh.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Display Mesh
displays the mesh.

Save Picture
opens the *Save Picture Dialog Box* (p. 1988), allowing you to save a picture file of the mesh each time ANSYS FLUENT updates it during the mesh preview.

Enable Autosave
opens the *Autosave Case During Mesh Motion Preview Dialog Box* (p. 1897), allowing you to save the case and data files with the specified name and frequency. See *Automatic Saving of Case and Data Files* (p. 65) for details.

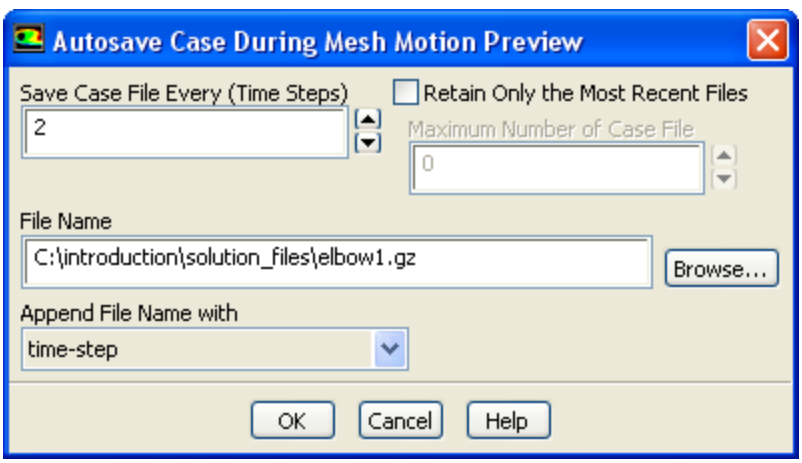
Update Mesh Interfaces
allows you to update the interface at every time step.

Display Frequency
displays the frequency at which ANSYS FLUENT will update the mesh display.

Preview
allows you to preview the motion of the selected zones in the graphics window.

35.9.13. Autosave Case During Mesh Motion Preview Dialog Box

The **Autosave Case During Mesh Motion Preview** dialog box allows you to automatically save your case during the dynamic mesh preview as it changes with time, while running your simulation. See *Automatic Saving of Case and Data Files* (p. 65) for details about the inputs.



Controls

Save Case File Every
contains the parameters to specify the time interval at which to update the mesh.

Retain Only the Most Recent Files
allows you to restrict the number of files saved by ANSYS FLUENT if you have limited disk space. When this option is enabled, you can enter the appropriate value in the **Maximum Number of Data Files** field.

Note

Only the associated case files are retained when using this option.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Maximum Number of Data Files

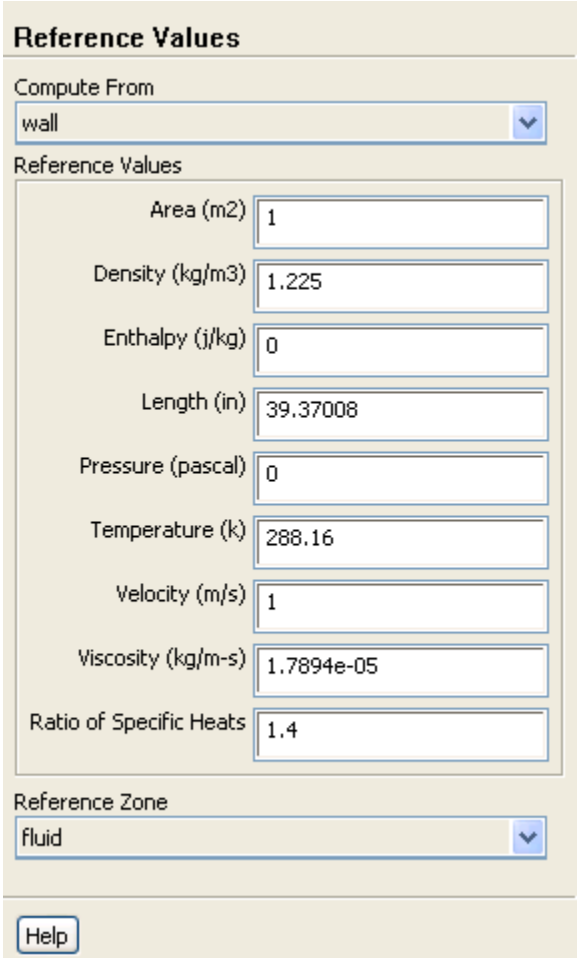
specifies the maximum number of data files that can be saved at any instance. If you have constraints on the disk space, you can restrict the number of files to be saved using this field. After saving the specified number of files, ANSYS FLUENT will overwrite the earliest existing file. The default value for this field is zero which saves all the files.

Append File Name with

allows you to select **flow-time** or **time-step** to be appended to the file name. This option is available only for unsteady-state calculations. The default selection is **flow-time**.

35.10. Reference Values Task Page

The **Reference Values** task page allows you to set the reference quantities used for computing normalized flow field variables. It also allows you to specify the reference zone for postprocessing relative velocities in moving-zone problems. See *Reference Values* (p. 1523) for details about the items below.



Controls

Compute from

contains a drop-down list of the boundary zones. You may select a zone to be used for automatically defining the reference values, but depending on the boundary condition used, all of the reference values may not be set. For example, the reference length and area will not be set by computing the reference values from a boundary condition; you will need to set these manually.

Reference Values

contains inputs for the reference values.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Area
sets the reference area, which is used to compute the force and moment coefficients.

Depth
sets the reference depth used for computing cell volumes in 2D.

Density
sets the reference density, which is used to compute the reference dynamic pressure.

Enthalpy
sets the reference enthalpy, which is used to determine the total enthalpy change.

Length
sets the reference length, which is used in the computation of the moment coefficient.

Pressure
sets the reference pressure, which is used to compute the pressure-related forces and moments and the pressure coefficient.

Temperature
sets the reference temperature, which is used to compute entropy for incompressible flows.

Velocity
sets the reference velocity magnitude, which is used to compute the reference dynamic pressure.

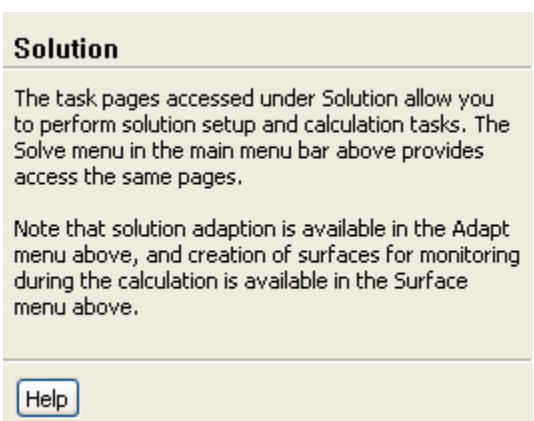
Viscosity
sets the reference kinematic viscosity, which is used in the computation of the boundary Reynolds number.

Ratio of Specific Heats
sets the value of the specific heat ratio, which is used in turbomachinery efficiency calculations.

Reference Zone
contains a drop-down list of all cell zones in the domain. For flows involving multiple moving zones, you will need to select the reference zone for postprocessing relative velocities and related quantities. See *Setting the Reference Zone* (p. 1525) for details.

35.11. Solution Task Page

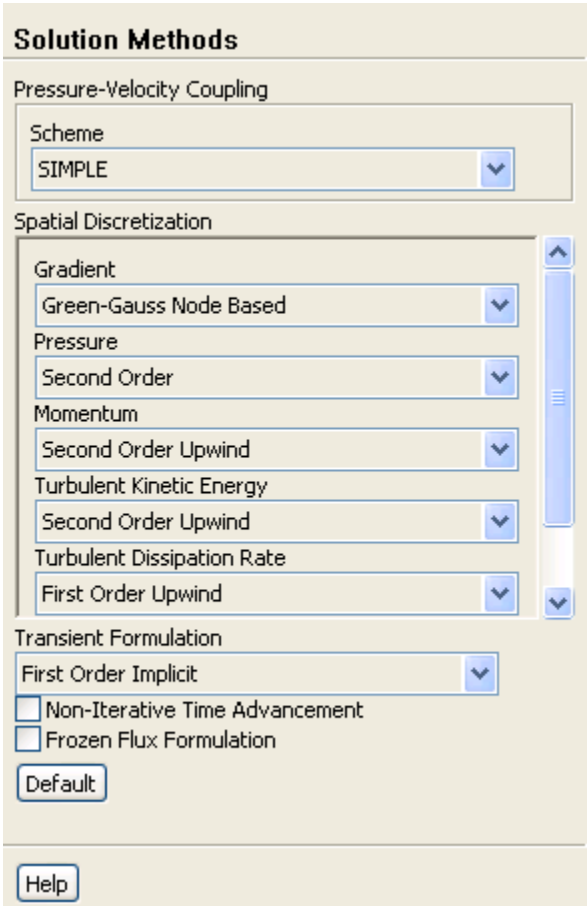
The **Solution** task page introduces you to the main tasks involved in solving your CFD simulation using ANSYS FLUENT. For more information about using ANSYS FLUENT to solve your CFD simulation, see *Using the Solver* (p. 1207).



Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.12. Solution Methods Task Page

The **Solution Methods** task page allows you to specify various parameters associated with the solution method to be used in the calculation.



Controls

Formulation

provides a drop-down list of the available types of solver formulations: **Implicit** and **Explicit**.

This item appears only when the density-based solver is used.

Flux Type

provides a drop-down list of the convective flux types: **Roe-FDS**, **AUSM**, and **Low Diffusion Roe-FDS**. Details about each of the flux types can be found in Convective Fluxes in the Theory Guide.

Pressure-Velocity Coupling

contains settings for pressure-velocity coupling schemes.

Scheme

provides a drop-down list of the available pressure-velocity coupling schemes: **SIMPLE**, **SIMPLEC**, **PISO**, and **Coupled**. **Fractional Step** is available in the drop-down list when the non-iterative time advancement (NITA) scheme is enabled in the **Solution Methods** task page. See Pressure-Velocity Coupling in the Theory Guide and *Choosing the Pressure-Velocity Coupling Method* (p. 1215) and *Setting Solution Controls for the Non-Iterative Solver* (p. 1219) for details about these methods.

This item appears only when the pressure-based solver is used.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Skewness Correction
enables the SIMPLEC and PISO skewness correction for highly skewed meshes if the value (number of iterations) is greater than 0. The default value is 0 for SIMPLEC and 1 for PISO.

Neighbor Correction
enables the PISO neighbor correction, which is recommended for transient calculations, if the value (number of iterations) is greater than 0. The default value is 1.

Skewness-Neighbor Coupling
allows for a more economical but a less robust variation of the PISO algorithm.

Spatial Discretization
contains settings that control the spatial discretization of the convection terms in the solution equations. See *Choosing the Spatial Discretization Scheme* (p. 1210) for details.

Gradient
contains a drop-down list of the options for setting the method of computing the gradient in Equation 19–28 in the Theory Guide: **Green-Gauss Cell Based**; **Green-Gauss Node-Based**, and **Least Squares Cell Based**. See Evaluation of Gradients and Derivatives in the Theory Guide for details.

Pressure
(for the pressure-based solver only) contains a drop-down list of the discretization schemes available for the pressure equation: **Standard**, **PRESTO!**, **Linear**, **Second Order**, and **Body Force Weighted**.

This item appears only when the pressure-based solver is used.

Flow
(for the density-based solvers only) contains a drop-down list of the discretization schemes available for the pressure, momentum, and (if relevant) energy equations: **First Order Upwind**, **Second Order Upwind**, and **Third-Order MUSCL**.

This item appears only when one of the density-based solvers is used.

Momentum, Energy, etc.
are the names of the other convection-diffusion equations being solved. In the drop-down list next to each equation, you can select the **First Order Upwind**, **Second Order Upwind**, **Power Law**, **QUICK**, or **Third-Order MUSCL** discretization scheme for that equation.

If the LES turbulence model is enabled, then you have a choice of selecting **Bounded Central Differencing** or **Central Differencing**to solve the convection-diffusion equations.

If one of the density-based solvers is used, **Momentum** and **Energy** will not appear. For the density-based solvers, the discretization scheme for these equations is selected in the **Flow** drop-down list (described above).

Volume Fraction
is available when the VOF multiphase model is enabled. The discretization schemes that are used when solving volume fraction equations for the VOF explicit scheme are **Geo-Reconstruct**, **Compressive**, **CICSAM**, **Modified HRIC**, and **QUICK**. The discretization schemes that are used when solving volume fraction equations for the VOF implicit scheme are **First Order Upwind**, **Second Order Upwind**, **Compressive**, **Modified HRIC**, **BGM** (steady state only), and **QUICK**. See Interpolation Near the Interface in the Theory Guide for detailed information about these VOF-specific interpolation schemes.

Transient Formulation
contains options for setting different time-dependent solution formulations. This option appears only when **Transient** is enabled under **Time** in the **General** task page. Available options include: **Explicit**

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

(available only for the **Density Based Explicit** solver); **First Order Implicit**; **Second Order Implicit**; and **Bounded Second Order Implicit**. See *Performing Time-Dependent Calculations* (p. 1255) for details.

Non-iterative Time Advancement

enables non-iterative time-advancement (NITA) scheme. See Time-Advancement Algorithm in the Theory Guide for details.

Frozen Flux Formulation

enables an option to discretize the convective part of Equation 19–61 in the Theory Guide using the mass flux at the cell faces from the previous time level n. This option is available only for a **Transient** solution. See The Frozen Flux Formulation in the Theory Guide for details.

Pseudo Transient

enables an option to apply the pseudo transient under-relaxation method, which is a form of implicit under-relaxation (see Pseudo Transient Under-Relaxation). This option is available for the pressure-based solver when **Coupled** is selected as the **Pressure-Velocity Coupling** scheme and for the density-based implicit solver. Note that this method can only be used when running a steady-state simulation.

Set All Species Discretizations Together

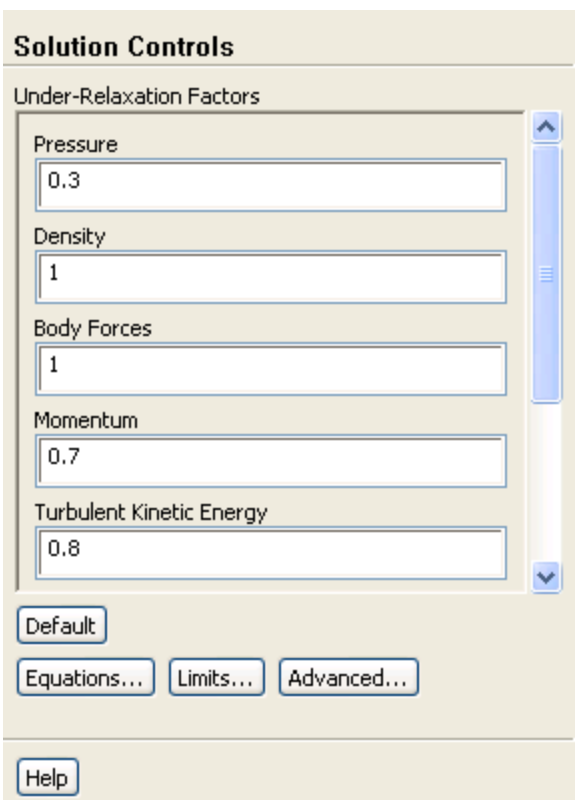
enables an option to use the same discretization scheme for all the species rather than setting each of the species individually. Notice that you will no longer see your list of individual species, instead a **Species** field will appear with the scheme of your choice. Note that this option is available when species transport is enabled.

Default

sets the fields to their default values, as assigned by ANSYS FLUENT.

35.13. Solution Controls Task Page

The **Solution Controls** task page allows you to set common solution parameters.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Courant Number

sets the fine-grid Courant number (time step factor) when the density-based solver is used. See *Changing the Courant Number* (p. 1222) for guidelines on setting the Courant number.

When the pressure-based solver is used for time-independent flows, and the **Coupled** pressure-velocity scheme is used, the **Courant Number** is used to stabilize the convergence behavior. See Under-Relaxation of Equations in the Theory Guide for a correlation of the under-relaxation factor and courant number.

Explicit Relaxation Factors

for the **Coupled** scheme defines the explicit relaxation of variables between sub-iterations for momentum and pressure. See Under-Relaxation of Variables in the Theory Guide for information.

Multigrid Levels

specifies the maximum number of coarse levels to be created by the FAS multigrid solver. This item is the same as the **Max Coarse Levels** under **FAS Multigrid Controls** in the **Multigrid** tab of the *Advanced Solution Controls Dialog Box* (p. 1906), and it appears only when the density-based explicit solver is used.

Residual Smoothing

contains parameters that govern the use of implicit residual smoothing. (See Implicit Residual Smoothing in the Theory Guide and *Using Residual Smoothing to Increase the Courant Number* (p. 1226) for details.) This section of the task page will appear only when the density-based explicit solver is used.

Iterations

sets the number of iterations of the Jacobi smoother to use. If **Iterations** is 0, then no implicit residual smoothing is performed.

Smoothing Factor

sets the implicit residual smoothing factor. This item will not appear unless **Iterations** is set to a non-zero value.

Under-Relaxation Factors

contains the under-relaxation factors for all equations that are being solved with the pressure-based solver. (See *Setting Under-Relaxation Factors* (p. 1217) for details.) In the field next to each equation, you can set the under-relaxation factor for that equation.

When one of the density-based solvers is used, **Under-Relaxation Factors** will appear only for the following variables, when they are included in your model: solid (for conjugate heat transfer models), turbulence variables, and viscosity. The density-based solvers use a segregated method to solve these equations; all the other equations are solved in a coupled manner, so there are no under-relaxation factors for them.

When **Non-iterative Time Advancement** is selected for the pressures-based solver, the **Non-Iterative Solver Relaxation Factors** define the explicit relaxation (Under-Relaxation of Variables in the Theory Guide) of variables between sub-iterations and are used to prevent the solution from diverging.

When **Pseudo Transient** is selected (available with the pressures-based coupled solver), the **Pseudo Transient Explicit Relaxation Factors** can be specified (see *Setting Pseudo Transient Explicit Relaxation Factors* (p. 1250)).

Default

sets the fields to their default values, as assigned by ANSYS FLUENT.

Equations...

displays the *Equations Dialog Box* (p. 1904).

Limits...

displays the *Solution Limits Dialog Box* (p. 1904).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Advanced...
displays the *Advanced Solution Controls Dialog Box* (p. 1906).

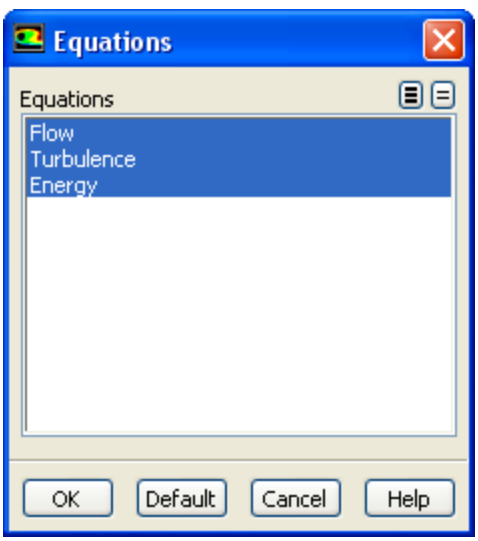
Set All Species URFs Together
enables an option to use the same under-relaxation factors for all the species rather than setting each of the species individually. Notice that you will no longer see your list of individual species, instead a **Species** field will appear with the specified under-relaxation factor. Note that this option is available when species transport is enabled.

For additional information, please see the following sections:
35.13.1. Equations Dialog Box
35.13.2. Solution Limits Dialog Box
35.13.3. Advanced Solution Controls Dialog Box

35.13.1. Equations Dialog Box

The **Equations** dialog box contains a list of the equations being solved for the current model. To temporarily disable solution of an equation, deselect it in this list and click **OK**. To re-enable the calculation for an equation, select it and click **OK**. See *Step-by-Step Solution Processes* (p. 1318) for details about using this feature in a step-by-step solution process.

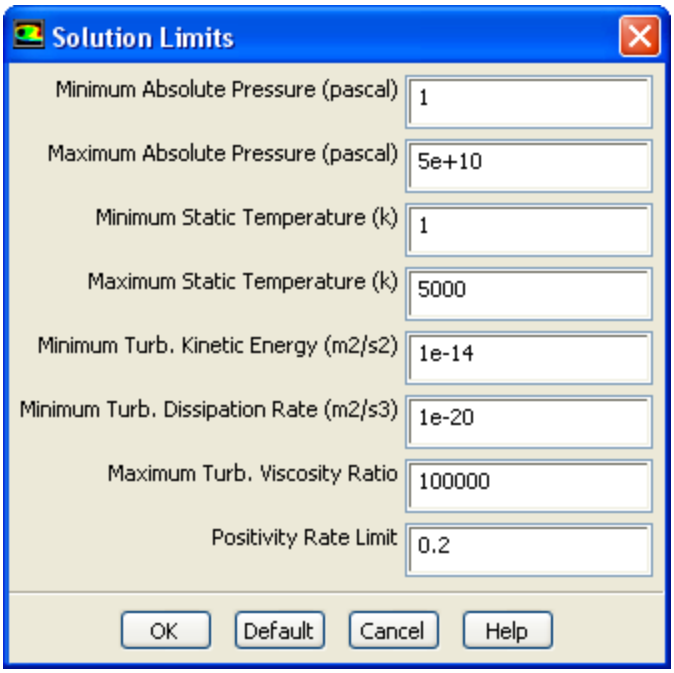
Note that, when one of the density-based solvers is used, **Energy** will not appear as a separate item in the **Equations** list. For the density-based solvers the energy equation is included in the **Flow** category (which also includes the pressure and momentum equations).



35.13.2. Solution Limits Dialog Box

The **Solution Limits** dialog box allows you to improve the stability of the solution. See *Setting Solution Limits* (p. 1235) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Minimum Absolute Pressure, Maximum Absolute Pressure
set the limiting minimum and maximum allowable values for absolute pressure.

Minimum Static Temperature, Maximum Static Temperature
set the limiting minimum and maximum allowable values for temperature.

Minimum Turb. Kinetic Energy
sets the limiting minimum value of turbulent kinetic energy (k) in the flow field. This parameter appears when one of the k- ε or k- ω models or the RSM is used.

Minimum Turb. Dissipation Rate
sets the limiting minimum value of turbulent dissipation rate (ε) in the flow field. This parameter appears when one of the k- ε models or the RSM is used.

Minimum Spec. Dissipation Rate
sets the limiting minimum value of specific dissipation rate (ω) in the flow field. This parameter appears when one of the k- ω models is used.

Maximum Turb. Viscosity Ratio
sets the limiting maximum allowable value of the ratio of turbulent to laminar viscosity (μ_t/μ). The turbulent viscosity is reduced to the necessary value so as not to exceed the maximum allowable viscosity ratio.

This parameter appears for all turbulent flows.

Positivity Rate Limit
sets the limiting value for the rate of reduction of temperature. See *Adjusting the Positivity Rate Limit* (p. 1236) for details.

This item appears only when one of the density-based solvers is used.

Default
sets the fields to their default values, as assigned by ANSYS FLUENT. After execution, the **Default** button becomes the **Reset** button.

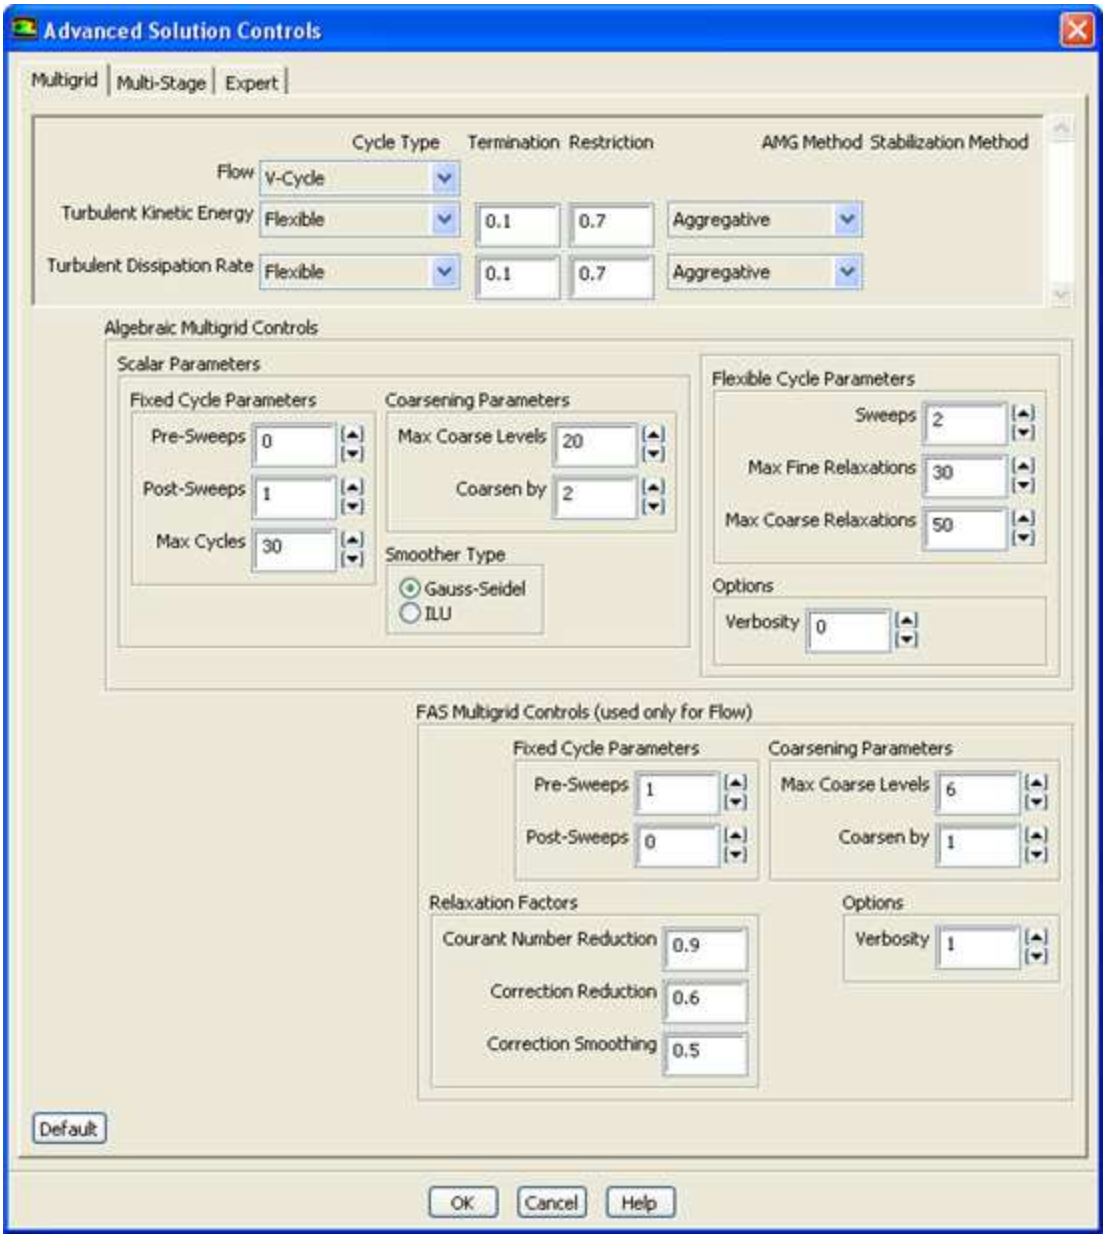
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reset

resets the fields to their most recently saved values (e.g., the values before **Default** was selected). After execution, the **Reset** button becomes the **Default** button.

35.13.3. Advanced Solution Controls Dialog Box

The **Advanced Solution Controls** dialog box allows you to set parameters related to the multigrid, multi-stage, and non-iterative solvers.



Controls

Multigrid

tab contains parameters related to the multigrid solver. See *Modifying Algebraic Multigrid Parameters* (p. 1319) and *Setting FAS Multigrid Parameters* (p. 1232) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Cycle Type

contains a drop-down list for each equation that is being solved. From this list you can select the multigrid cycle type (**Flexible**, **V-Cycle**, **W-Cycle**, or **F-Cycle**). See *Specifying the Multigrid Cycle Type* (p. 1227) for details.

Note that, for the density-based solvers, the **Pressure**, **Momentum**, and **Energy** equations will not appear individually. They will instead be grouped together and called **Flow**.

Furthermore, for the density-based explicit solver, the **Cycle Type** choices for the **Flow** equations will be limited to **V-Cycle** and **W-Cycle**, while the choices for **Flow** for the density-based implicit solver will be limited to **V-Cycle** and **F-Cycle**.

Termination

specifies the termination criterion for each equation that is being solved using algebraic multigrid. See *Setting the Termination and Residual Reduction Parameters* (p. 1227) for details.

Restriction

specifies the residual reduction criterion for each equation that is being solved using the **Flexible** algebraic multigrid cycle. See *Setting the Termination and Residual Reduction Parameters* (p. 1227) for details. (This item will not appear for an equation that is using a **V-Cycle**, **W-Cycle**, or **F-Cycle**.)

AMG Method

contains the drop-down list to choose between two AMG solvers: aggregative or selective. See *Setting the AMG Method and the Stabilization Parameters* (p. 1228) for details.

Aggregative

enables aggregative AMG solver.

Selective

enables selective AMG solver. The selective AMG solver is available only for scalar equations, and is not available in parallel ANSYS FLUENT.

Stabilization Method

contains the drop-down list to choose the stabilization method.

BCGSTAB

enables bi-conjugate gradient stabilized method.

RPM

enables the recursive projection method. RPM stabilization is mainly used in conjunction with the coupled pressure-based solver.

Algebraic Multigrid Controls

contains parameters related to the algebraic multigrid solver. See Algebraic Multigrid (AMG) in the Theory Guide and *Modifying Algebraic Multigrid Parameters* (p. 1319) for details.

Scalar and Coupled Parameters

contain parameters that you can set, If you are using the density-based explicit solver or the pressure-based solver with any of the segregated schemes, described in Pressure-Velocity Coupling in the Theory Guide and *Choosing the Pressure-Velocity Coupling Method* (p. 1215), you will only set **Scalar Parameters**. If you are using the density-based implicit or the pressure-based coupled scheme, described in Coupled Algorithm, then you can set the **Coupled Parameters**.

Fixed Cycle Parameters

contains parameters that control the V, W, and F cycles. You can set the number of **Pre-Sweeps** and **Post-Sweeps**, and the **Max Cycles**. Normally one post-sweep is performed and no pre-sweeps are done. See *Fixed Cycle Parameters* (p. 1229) for details about using the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Pre-Sweeps
sets the number of sweeps to perform before moving to a coarser level.

Post-Sweeps
sets the number of sweeps to perform after coarser level corrections have been applied.

Max Cycles
sets the maximum number of V, W, or F cycles to be performed. The multigrid solver will continue to solve the set of equations until either the maximum number of cycles has been performed, or the **Termination** criteria are satisfied.

Coarsening Parameters
contains parameters that control the grouping of equations in the algebraic multigrid algorithm. See *Coarsening Parameters* (p. 1229) for details

Max Coarse Levels
is the maximum number of coarse levels that will be built by the multigrid solver. Sets of coarser simultaneous equations are built until the maximum number of levels has been created, or the coarsest level has only 3 equations. Each level has about half as many unknowns as the previous level, so coarsening until there are only a few nodes left will require about as much total coarse-level coefficient storage as was required on the fine mesh. Reducing the maximum coarse levels will reduce the memory requirements, but may require more iterations to achieve a converged solution. Setting **Max Coarse Levels** to 0 turns off the multigrid solver.

Coarsen by
controls the number of equations on each successively coarser grid level. By default, this parameter is set to 2, indicating that the number of equations on each level will be 1/2 of the number on the previous level. In general, the number of equations on each coarser grid level will be equal to 1/ n of the number on the previous level, where n is the value set for the **Coarsen by** parameter.

Smoother Type
consist of two types:

Gauss-Seidel
is the simplest smoother type and is recommended when using the pressure-based segregated solver.

ILU
is more CPU intensive, but has better smoothing properties for block-coupled systems such as the pressure-based coupled solver and the density-based implicit solver.

Flexible Cycle Parameters
contains parameters that control the flexible multigrid cycle.

Sweeps
specifies the number of times to apply the smoothing method each time a relaxation is performed.

Max Fine Relaxations
sets the maximum number of relaxations to be performed on the Level 1 grid (fine grid level). This parameter eliminates the possibility that the Gauss-Seidel solver will get "stuck" on the fine grid level, unable to reduce the residuals by the fraction (α) required by the **Termination** criteria.

Max Coarse Relaxations
sets the maximum number of relaxations to be performed on each grid level above Level 1 (i.e., the coarse grid levels). This parameter eliminates the possibility that the Gauss-Seidel

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

solver will get "stuck" on a coarse grid level, unable to reduce the residuals on that level by the fraction (α) required by the **Termination** criteria. If the iterative solution on a given grid level is unable to meet the accuracy constraint of the **Termination** criteria, the correction equation will be deemed "converged" when this maximum number of relaxations on that grid level has been performed.

Options

contains additional multigrid parameters.

Verbosity

controls the amount of information that is printed out by the multigrid solver for monitoring purposes. See *Setting the Verbosity* (p. 1231) for details

FAS Multigrid Controls

contains parameters related to the FAS multigrid solver. See Full-Approximation Storage (FAS) Multigrid in the Theory Guide and *Setting FAS Multigrid Parameters* (p. 1232) for details. As noted in the title of this dialog box section, the FAS multigrid solver is used only for the **Flow** equations (pressure, momentum, and energy).

This section of the dialog box appears only when the density-based explicit solver is used.

Fixed Cycle Parameters

contains parameters that control the V, W, and F cycles of the FAS multigrid solver.

Pre-Sweeps

sets the number of iterations of the multi-stage solver to be performed on a given grid level before proceeding to a coarser grid level (the value of β_1 described in Multigrid Cycles in the Theory Guide). Typically, this is set to 1.

Post-Sweeps

sets the number of multigrid cycles to be performed on a given grid level before proceeding back up to the finer grid level (the value of β_2 described in Multigrid Cycles in the Theory Guide). A value of 1 results in V-cycle multigrid, and a value of 2 results in W-cycle multigrid.

Coarsening Parameters

contains parameters that control the grouping of cells in the FAS multigrid algorithm.

Max Coarse Levels

sets the maximum number of grid levels to be used in the multigrid process. A value of 0 disables multigrid (no coarse grid levels). If the coarse grids do not already exist, they are created automatically when you start iterating; you cannot create them by clicking the **OK** button. See *Turning On FAS Multigrid* (p. 1225) for details.

Coarsen by

controls the number of cells in each successively coarser grid level. By default, this parameter is set to 2, indicating that the number of cells on each level will be 1/2 of the number on the previous level. In general, the number of cells on each coarser grid level will be equal to 1/ n of the number on the previous level, where n is the value set for the **Coarsen by** parameter.

Relaxation Factors

are provided to moderate and stabilize the multigrid corrections.

Courant Number Reduction

sets the factor by which to reduce the Courant number for coarse grid levels (i.e., every level except the finest). Some reduction of time step (such as the default 0.9) is typically required because the stability limit cannot be determined as precisely on the irregularly shaped coarser grid cells.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Correction Reduction

sets the factor by which to reduce the magnitude of the multigrid corrections transferred from one level to the next finer level. A typical value with $\beta_1 = 1$ is 0.6. If two **Pre-Sweeps** and two **Post-Sweeps** are performed, this value can often be increased to 1.0 (i.e., full correction transfer).

Species Correction Reduction

sets the factor by which to reduce the magnitude of the species corrections to stabilize the multigrid calculation. This item appears only when species transport is being modeled.

Correction Smoothing

sets the correction smoothing factor used to interpolate corrections from a coarser grid to a finer grid. For multigrid on structured meshes, corrections can be interpolated up to a finer mesh "smoothly" by using, for example, tri-linear interpolation. For unstructured meshes there is no analogous simple, algebraic procedure that can be used to interpolate without introducing substantial high frequency "noise". Instead, the corrections are first interpolated, and then subjected to a smoothing pass. The default **Correction Smoothing** value of 0.5 should be acceptable for all cases; you should not need to change it.

Options

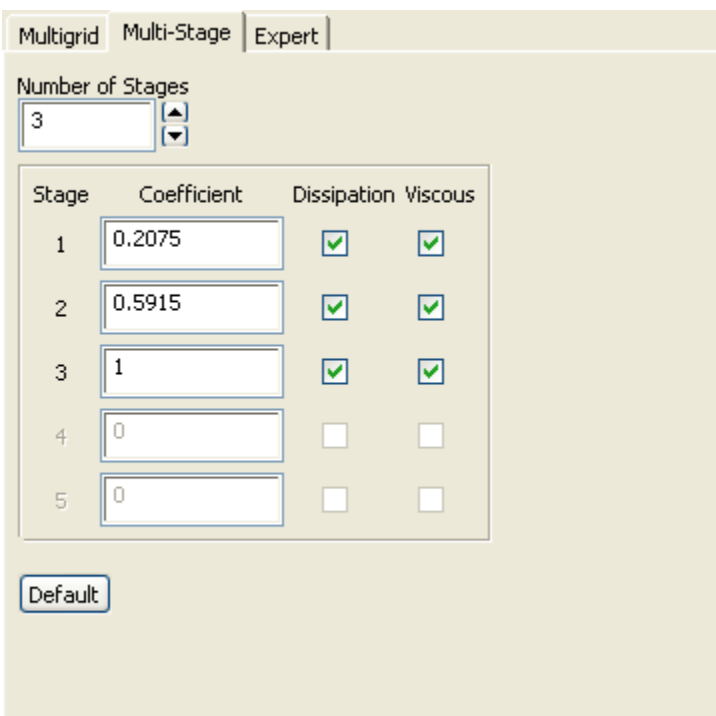
contains additional multigrid parameters.

Verbosity

controls the amount of information that is printed out by the multigrid solver for monitoring purposes.

Mulit-Stage

tab allows you to set parameters that govern the operation of the multi-stage solver. It is available only when the density-based explicit solver is used. See *Changing the Multi-Stage Scheme* (p. 1237) for details about the items below.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of Stages

is the number of stages used in the multi-stage scheme. The default scheme is a 3-stage scheme with coefficients of 0.2075, 0.5915, and 1.0 for the first through third stages, respectively. Although the dialog box limits the maximum number of stages to five, you can define a scheme with an arbitrary number of stages with the `solve/set/multi-stage` text command.

Stage

labels the stage to which the parameters in the other columns apply.

Coefficient

sets the multi-stage coefficient for each stage. Coefficients should be greater than zero and less than one. The final stage should always have a coefficient of 1.

Dissipation

sets the stages for which artificial dissipation is evaluated. If a **Dissipation** box is selected for a particular stage, artificial dissipation will be updated on that stage. If not selected, artificial dissipation will remain "frozen" at the value of the previous stage.

Viscous

sets the stages for which viscous stresses are evaluated. If a **Viscous** box is selected for a particular stage, viscous stresses will be updated on that stage. If not selected, viscous stresses will remain "frozen" at the value of the previous stage. Viscous stresses should always be computed on the first stage, and successive evaluations will increase the "robustness" of the solution process, but will also increase the expense (i.e., increase the CPU time per iteration). For steady problems, the final solution is independent of the stages on which viscous stresses are updated.

Default

sets the fields to their default values, as assigned by ANSYS FLUENT. After execution, the **Default** button becomes the **Reset** button.

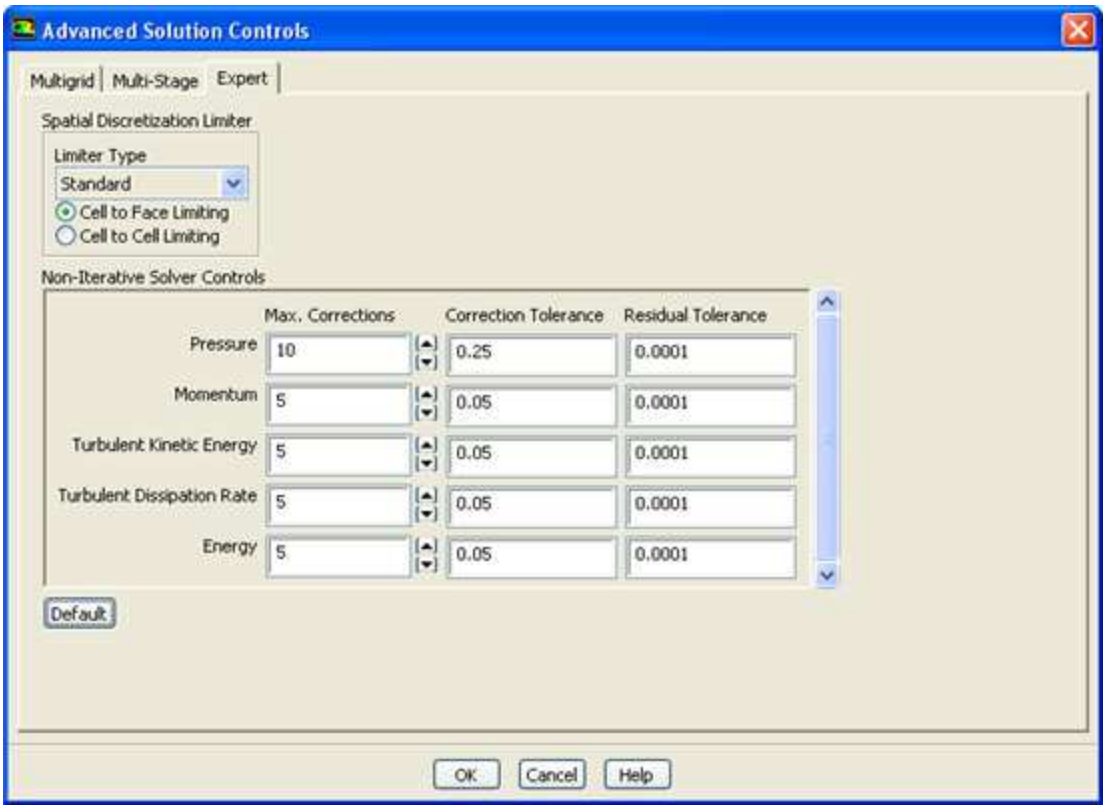
Reset

resets the fields to their most recently saved values (i.e., the values before **Default** was selected). After execution, the **Reset** button becomes the **Default** button.

Expert

tab contains specialized parameters for limiting spatial discretization, as well as controls for the non-iterative solver.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Spatial Discretization Limiter

contains a **Limiter Type** drop-down list of the options available for limiting the spatial discretization: **Standard**, **Multidimensional**, or **Differentiable**. See *Selecting Gradient Limiters* (p. 1239) for more information about limiters.

Cell to Face Limiting

is where the limited value of the reconstruction gradient is determined at the cell face centers. This is the default method.

Cell to Cell Limiting

is where the limited value of the reconstruction gradient is determined along a scaled line between two adjacent cell centroids. On an orthogonal mesh (or when the cell-to-cell direction is parallel to face area direction), this method becomes equivalent to the default cell to face method. For smooth field variation, cell to cell limiting may provide less numerical dissipation on meshes with skewed cells.

Pseudo Transient Specific Time Step Controls

allows you to select and modify the pseudo time steps for specific equations. See *Setting Solution Controls for the Pseudo Transient Method* (p. 1251) for details.

Activate

selects the equation for which you want to specify a different time step from the global pseudo time step.

Time Step

overrides the **Pseudo Time Step** that is specified in the *Run Calculation Task Page* (p. 1955).

Non-Iterative Solver Controls

contain parameters that control the sub-iterations for the individual equations. See Time-Advancement Algorithm in the Theory Guide for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Max. Corrections
provide control over the maximum number of sub-iterations for each individual equation.

Correction Tolerance
defines the overall accuracy.

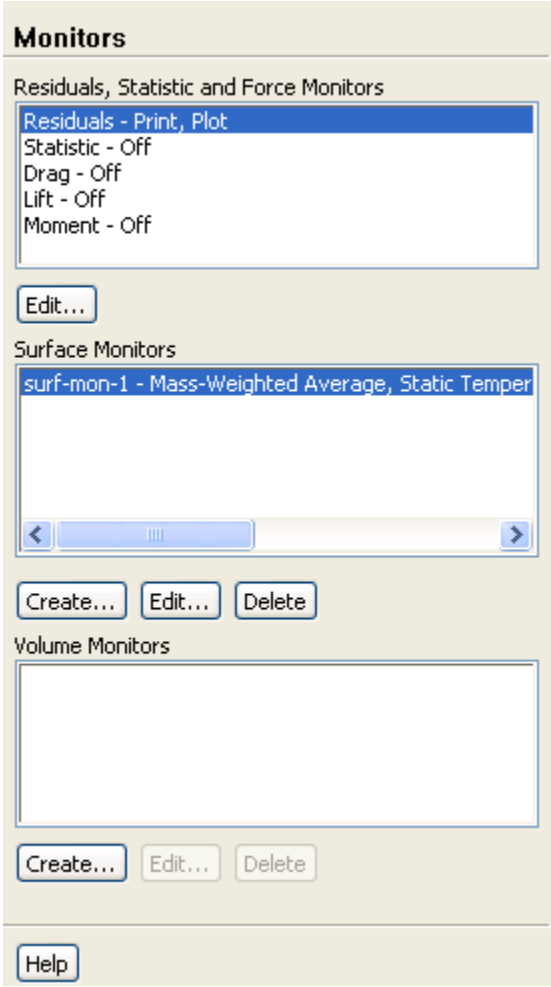
Residual Tolerance
controls the solution of the linear equations.

Default
sets the fields to their default values, as assigned by ANSYS FLUENT. After execution, the **Default** button becomes the **Reset** button.

Reset
resets the fields to their most recently saved values (i.e., the values before **Default** was selected). After execution, the **Reset** button becomes the **Default** button.

35.14. Monitors Task Page

The **Monitors** task page allows you to set up tools for monitoring the convergence of your solution dynamically by checking residuals, statistics, force values, surface integrals, and volume integrals. See *Monitoring Solution Convergence* (p. 1268) for details.



Controls

Residuals, Statistic and Force Monitors

contains a listing of the monitors for your solution residuals, statistics, and/or force values

You can double-click an item in the list to open the corresponding dialog box, or you can select the item in the list and click the **Edit...** button.

Residuals

selecting this item and clicking the **Edit...** button opens the *Residual Monitors Dialog Box* (p. 1915).

Statistic

selecting this item and clicking the **Edit...** button opens the *Statistic Monitors Dialog Box* (p. 1917).

Drag

selecting this item and clicking the **Edit...** button opens the *Drag Monitor Dialog Box* (p. 1918).

Lift

selecting this item and clicking the **Edit...** button opens the *Lift Monitor Dialog Box* (p. 1920).

Moment

selecting this item and clicking the **Edit...** button opens the *Moment Monitor Dialog Box* (p. 1921).

Edit...

displays the dialog box corresponding to the selected item in the **Residuals, Statistic and Force Monitors** list.

Surface Monitors

contains a list of available surface monitors.

Create...

opens the *Surface Monitor Dialog Box* (p. 1923) where you can create a new surface monitor.

Edit...

opens the *Surface Monitor Dialog Box* (p. 1923) where you can edit an existing surface monitor.

Delete

removes the selected surface monitor(s) from the **Surface Monitors** list.

Volume Monitors

contains a list of available volume monitors.

Create...

opens the *Volume Monitor Dialog Box* (p. 1925) where you can create a new volume monitor.

Edit...

opens the *Volume Monitor Dialog Box* (p. 1925) where you can edit an existing volume monitor.

Delete

removes the selected volume monitor(s) from the **Volume Monitors** list.

For additional information, please see the following sections:

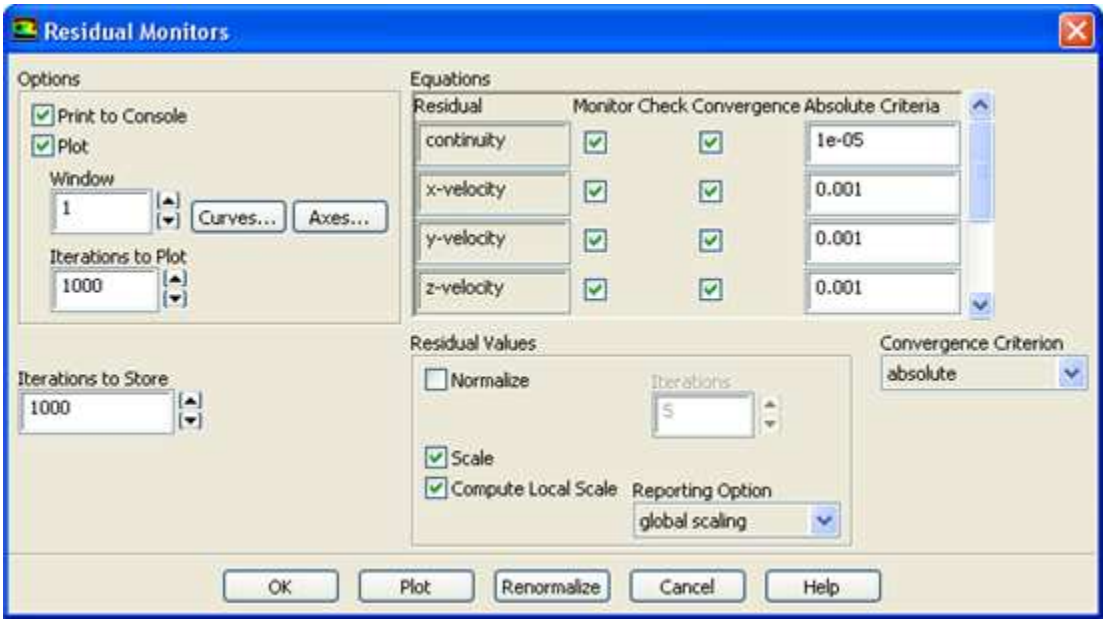
35.14.1. Residual Monitors Dialog Box
35.14.2. Statistic Monitors Dialog Box
35.14.3. Drag Monitor Dialog Box
35.14.4. Lift Monitor Dialog Box
35.14.5. Moment Monitor Dialog Box
35.14.6. Surface Monitor Dialog Box
35.14.7. Volume Monitor Dialog Box
35.14.8. Point Surface Dialog Box
35.14.9. Line/Rake Surface Dialog Box
35.14.10. Plane Surface Dialog Box
35.14.11. Quadric Surface Dialog Box

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.14.12. Iso-Surface Dialog Box
35.14.13. Iso-Clip Dialog Box
35.14.14. Surfaces Dialog Box

35.14.1. Residual Monitors Dialog Box

You can use the **Residual Monitors** dialog box to control the residual information that ANSYS FLUENT reports. See *Monitoring Residuals* (p. 1269) for details about the items below.



Controls

Options

selects any combination of the following methods for reporting residuals. See *Printing and Plotting Residuals* (p. 1272) for details.

Print to Console

specifies whether or not to print residuals in the text window after each iteration.

Plot

specifies whether or not to plot residuals in the graphics window (with the window ID set in **Window**) after each iteration. See *Plot Parameters* (p. 1276) for details.

Window

sets the window ID in which the plot will be drawn. When ANSYS FLUENT is iterating, the active graphics window is temporarily set to this window to update the residual plot, and then returned to its previous value. Thus, the residual plot can be maintained in a separate window that does not interfere with other graphical postprocessing.

Iterations to Plot

is the number of history points to display on the residual plot.

Axes...

opens the *Axes Dialog Box* (p. 2022), which allows you to modify the attributes of the axes.

Curves...

opens the *Curves Dialog Box* (p. 2024), which allows you to modify the attributes of the residual curves.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Iteration to Store

sets the number of residual history points to be stored in the data file. Due to the compaction algorithm used, saving 1000 points does not result in just the last 1000 iterations being saved; the history reaches back quite a bit further than that, but does not save a point at every iteration. Further back in the iteration history, the spacing between saved iterations grows larger. See *Storing Residual History Points* (p. 1273) for details.

Residual Values

controls the normalization and scaling of residuals. See *Controlling Normalization and Scaling* (p. 1273) for details.

Normalize

specifies whether or not to normalize the printed or plotted residual for each variable by the value indicated as the **Normalization Factor** for that variable. The default **Normalization Factor** is the maximum residual value after the first 5 iterations.

This option is off by default.

Iterations

sets the number of iterations for which ANSYS FLUENT will search for the largest residual to normalize by. (If the **Normalize** option is turned off, this item will not be editable.)

Scale

specifies whether or not to print or plot scaled residuals for each variable. This option is on by default.

Compute Local Scale

computes and stores both the locally and globally scaled residuals from subsequent iterations, for the purpose of reporting. You will select the type of residual scaling form the **Reporting Option** drop-down list. See *Definition of Residuals for the Pressure-Based Solver* (p. 1269) and *Definition of Residuals for the Density-Based Solver* (p. 1270) for more information.

Reporting Option

gives you the choice of plotting or printing to the console the **global scaling** or **local scaling** of residuals.

Convergence Criterion

consists of four options that are available for checking an equation for convergence.

absolute

is the default and is available for steady-state cases. The residual (scaled and/or normalized) of an equation at an iteration is compared with a user-specified value. If the residual is less than the user-specified value, that equation is deemed to have converged for a time step.

relative

is where the residual of an equation at an iteration of a time step is compared with the residual at the start of the time step. If the ratio of the two residuals is less than a user-specified value, that equation is deemed to have converged for a time step.

relative or absolute

is where either the **absolute** convergence criterion or the **relative** convergence criterion is met. At that point, the equation is considered converged.

none

is used to disable convergence checking.

Residual

indicates the name of each variable for which residual information is available.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Monitor

indicates whether or not the residuals for each variable are to be monitored. You can toggle monitoring on and off for each variable by turning the corresponding check box in the **Monitor** list on or off.

Normalization Factor

shows the normalization factor for each variable. The default is the maximum residual value after the first 5 iterations. To set this value manually, enter a new value in the corresponding **Normalization Factor** field. This list will not appear if the **Normalize** option is turned off.

Check Convergence

indicates whether or not the convergence of each variable is to be monitored. If convergence is being monitored, the solution will stop automatically when each variable meets its specified convergence criterion. You can check convergence only for variables for which you are monitoring residuals. You can toggle convergence checking on and off for each variable by turning the corresponding check box in the **Check Convergence** list on or off.

Absolute Criteria

, **Relative Criteria** shows the residual value for which the solution of each variable will be considered converged. To set this value manually, enter a new value in the corresponding **Absolute Criteria**/ **Relative Criteria** field.

Plot

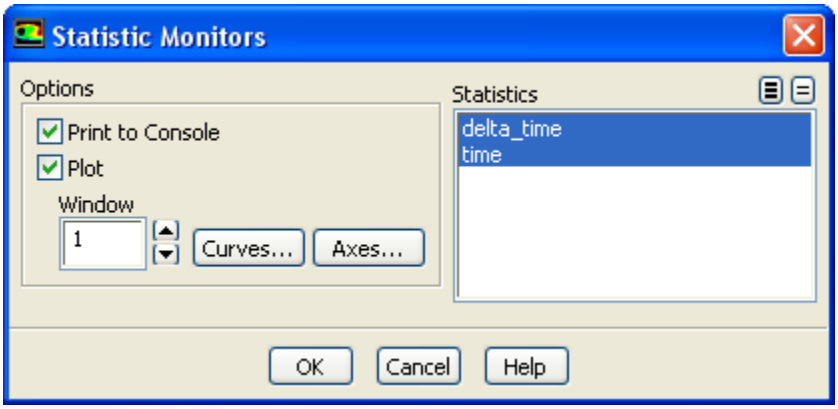
displays the current residual history plot.

Renormalize

sets the normalization factors to the maximum values in the residual histories. **Renormalize** should be used to renormalize the residual plot in cases where the maximum residuals occur sometime after the first five iterations.

35.14.2. Statistic Monitors Dialog Box

You can use the **Statistic Monitors** dialog box to control the statistics information that ANSYS FLUENT reports. See *Monitoring Statistics* (p. 1277) for details about using this dialog box.



Controls

Options

selects the following methods for reporting statistics:

Print to Console

specifies whether or not to print the selected statistics in the console window after each iteration.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Plot

specifies whether or not to plot each of the selected statistics in a separate graphics window after each iteration. The windows that the plots appear in are determined by the **First Window** option below.

Statistics

contains a list of statistics from which you can select those that are to be plotted. The availability of **per/pr-grad** is restricted to specified-mass-flow periodic flow calculations while **per/bulk-temp-ratio** is available only for specified-mass-flow periodic heat transfer calculations. Similarly, **time** and **delta_time** are available only if you are modeling unsteady flow.

Window

sets the window ID for the plot of the first statistic selected. The remaining selected statistics will be plotted in windows with incrementally higher IDs.

Axes...

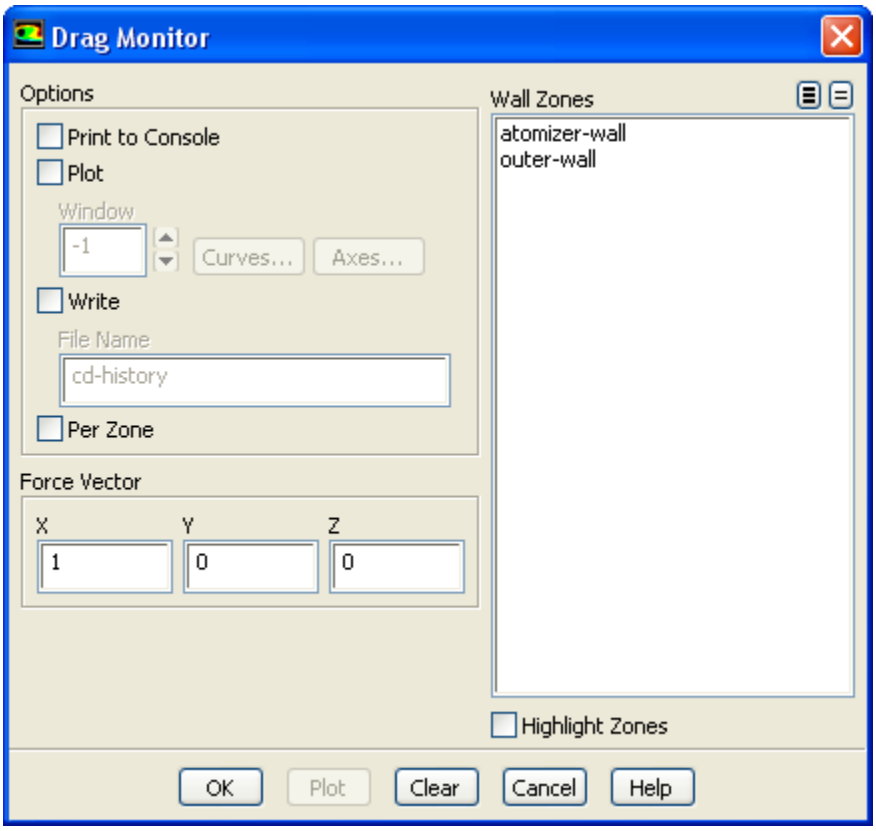
opens the *Axes Dialog Box* (p. 2022) to modify the attributes of the axes.

Curves...

opens the *Curves Dialog Box* (p. 2024) to modify the attributes of the data curves.

35.14.3. Drag Monitor Dialog Box

You can use the **Drag Monitor** dialog box to save the convergence history of the drag coefficient on specified wall zones. See *Monitoring Force and Moment Coefficients* (p. 1278) for details about using this dialog box.



Controls

Options

selects one of the following methods for reporting the selected coefficient:

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Print to Console
specifies whether or not to print the selected coefficient in the console window after each iteration.

Plot
specifies whether or not to plot the selected coefficient in the graphics window (with the ID set in **Window**) after each iteration.

Window
sets the window ID in which the plot will be drawn. When ANSYS FLUENT is iterating, the active graphics window is temporarily set to this window to update the force monitoring plots, and then returned to its previous value. Thus, the force coefficient plots can be maintained in separate windows that do not interfere with other graphical postprocessing.

Axes...
opens the *Axes Dialog Box* (p. 2022) to modify the attributes of the axes.

Curves...
opens the *Curves Dialog Box* (p. 2024) to modify the attributes of the data curves.

Write
specifies whether or not to write the selected coefficient data to a file (with the name in **File Name**) after each iteration.

Important

If you choose *not* to save the force coefficient data in a file, this information will be lost when you exit the current ANSYS FLUENT session.

File Name
specifies the name of the file to which the force data is written (if you are using the **Write** option).

Per Zone
specifies whether or not the forces or moments for multiple walls should be monitored on each wall separately. When this option is turned off (the default), ANSYS FLUENT will compute and monitor the total force for all of the selected walls combined together.

Force Vector
contains the components of the force vector.

X,Y,Z
are the components of the force vector along which the forces will be computed.

Wall Zones
contains a selectable list of wall zones on which the selected coefficient is computed. If you are monitoring more than one coefficient, the list of selected wall zones is often the same for each coefficient. If you want, however, you can have each coefficient computed on a different list of zones.

Highlight Zones
when enabled highlights the zone (selected in the **Drag Monitor** dialog box) in the graphics window.

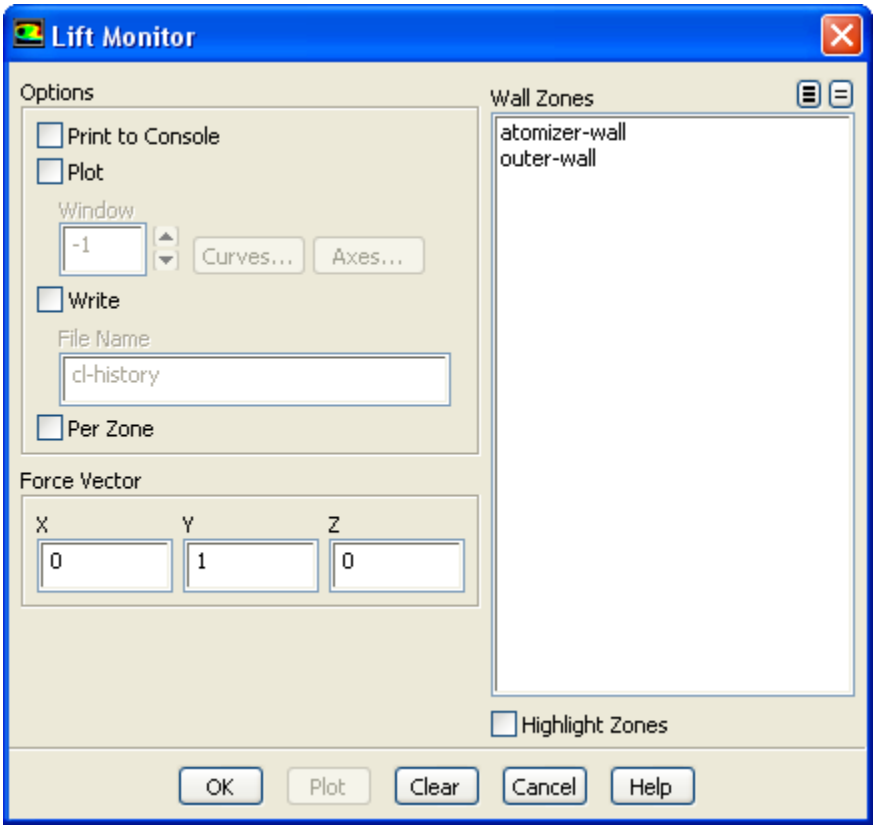
Plot
displays an XY plot of the convergence history of the selected force.

Clear
discards the force-monitoring data, including associated files. Each of these actions must be confirmed in a *Question Dialog Box* (p. 32).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.14.4. Lift Monitor Dialog Box

You can use the **Lift Monitor** dialog box to save the convergence history of the lift coefficient on specified wall zones. See *Monitoring Force and Moment Coefficients* (p. 1278) for details about using this dialog box.



Controls

Options

selects one of the following methods for reporting the selected coefficient:

Print to Console

specifies whether or not to print the selected coefficient in the console window after each iteration.

Plot

specifies whether or not to plot the selected coefficient in the graphics window (with the ID set in **Window**) after each iteration.

Window

sets the window ID in which the plot will be drawn. When ANSYS FLUENT is iterating, the active graphics window is temporarily set to this window to update the force monitoring plots, and then returned to its previous value. Thus, the force coefficient plots can be maintained in separate windows that do not interfere with other graphical postprocessing.

Axes...

opens the *Axes Dialog Box* (p. 2022) to modify the attributes of the axes.

Curves...

opens the *Curves Dialog Box* (p. 2024) to modify the attributes of the data curves.

Write

specifies whether or not to write the selected coefficient data to a file (with the name in **File Name**) after each iteration.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Important

If you choose *not* to save the force coefficient data in a file, this information will be lost when you exit the current ANSYS FLUENT session.

File Name
specifies the name of the file to which the force data is written (if you are using the **Write** option).

Per Zone
specifies whether or not the forces or moments for multiple walls should be monitored on each wall separately. When this option is turned off (the default), ANSYS FLUENT will compute and monitor the total force for all of the selected walls combined together.

Force Vector
contains the components of the force vector.

X,Y,Z
are the components of the force vector along which the forces will be computed.

Wall Zones
contains a selectable list of wall zones on which the selected coefficient is computed. If you are monitoring more than one coefficient, the list of selected wall zones is often the same for each coefficient. If you want, however, you can have each coefficient computed on a different list of zones.

Highlight Zones
when enabled highlights the zone (selected in the **Lift Monitor** dialog box) in the graphics window.

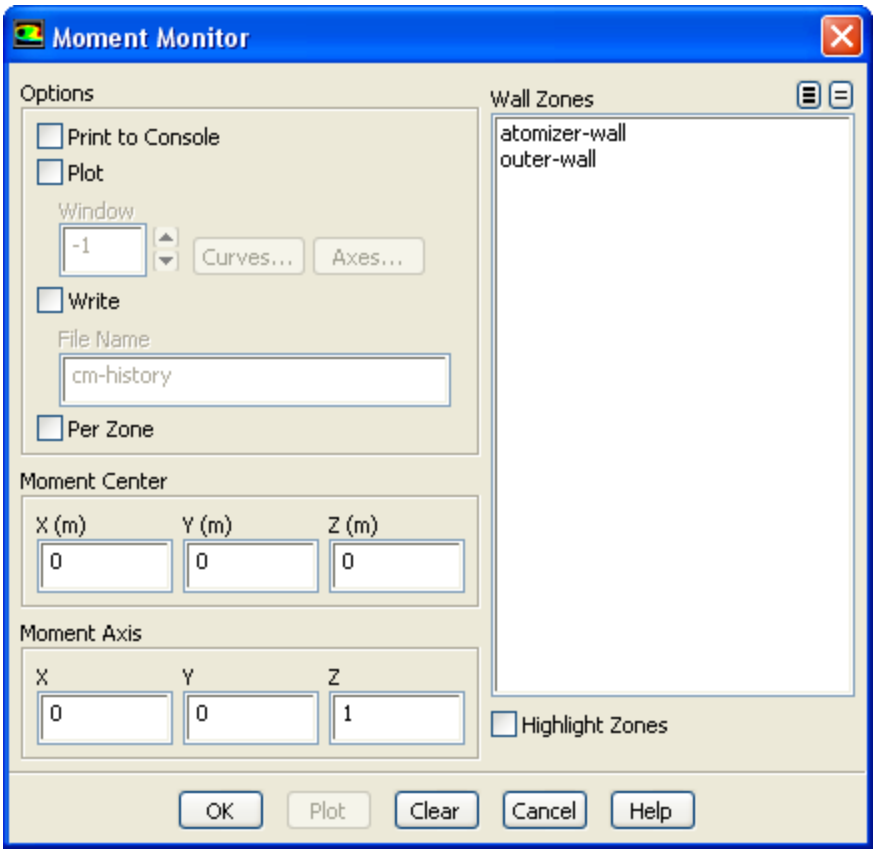
Plot
displays an XY plot of the convergence history of the selected force.

Clear
discards the force-monitoring data, including associated files. Each of these actions must be confirmed in a *Question Dialog Box* (p. 32).

35.14.5. Moment Monitor Dialog Box

You can use the **Moment Monitor** dialog box to save the convergence history of the moment coefficient on specified wall zones. See *Monitoring Force and Moment Coefficients* (p. 1278) for details about using this dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

selects one of the following methods for reporting the selected coefficient:

Print to Console

specifies whether or not to print the selected coefficient in the console window after each iteration.

Plot

specifies whether or not to plot the selected coefficient in the graphics window (with the ID set in **Window**) after each iteration.

Window

sets the window ID in which the plot will be displayed. When ANSYS FLUENT is iterating, the active graphics window is temporarily set to this window to update the force monitoring plots, and then returned to its previous value. Thus, the force coefficient plots can be maintained in separate windows that do not interfere with other graphical postprocessing.

Axes...

opens the *Axes Dialog Box* (p. 2022) to modify the attributes of the axes.

Curves...

opens the *Curves Dialog Box* (p. 2024) to modify the attributes of the data curves.

Write

specifies whether or not to write the selected coefficient data to a file (with the name in **File Name**) after each iteration.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Important

If you choose *not* to save the force coefficient data in a file, this information will be lost when you exit the current ANSYS FLUENT session.

File Name
specifies the name of the file to which the force data is written (if you are using the **Write** option).

Per Zone
specifies whether or not the moments for multiple walls should be monitored on each wall separately. When this option is turned off (the default), ANSYS FLUENT will compute and monitor the total moment for all of the selected walls combined together.

Moment Center
contains the Cartesian coordinates of the moment center.

X,Y,Z
are the Cartesian coordinates of the moment center about which moments will be computed.

Moment Axis
contains the Cartesian coordinates of the moment vector to be monitored. For two-dimensional flows, only the moment vector about the z-coordinate axis exists. Presently, you can monitor only one component of the moment vector at a time.

Wall Zones
contains a selectable list of wall zones on which the selected coefficient is computed. If you are monitoring more than one coefficient, the list of selected wall zones is often the same for each coefficient. If you want, however, you can have each coefficient computed on a different list of zones.

Highlight Zones
when enabled highlights the zone (selected in the **Moment Monitor** dialog box) in the graphics window.

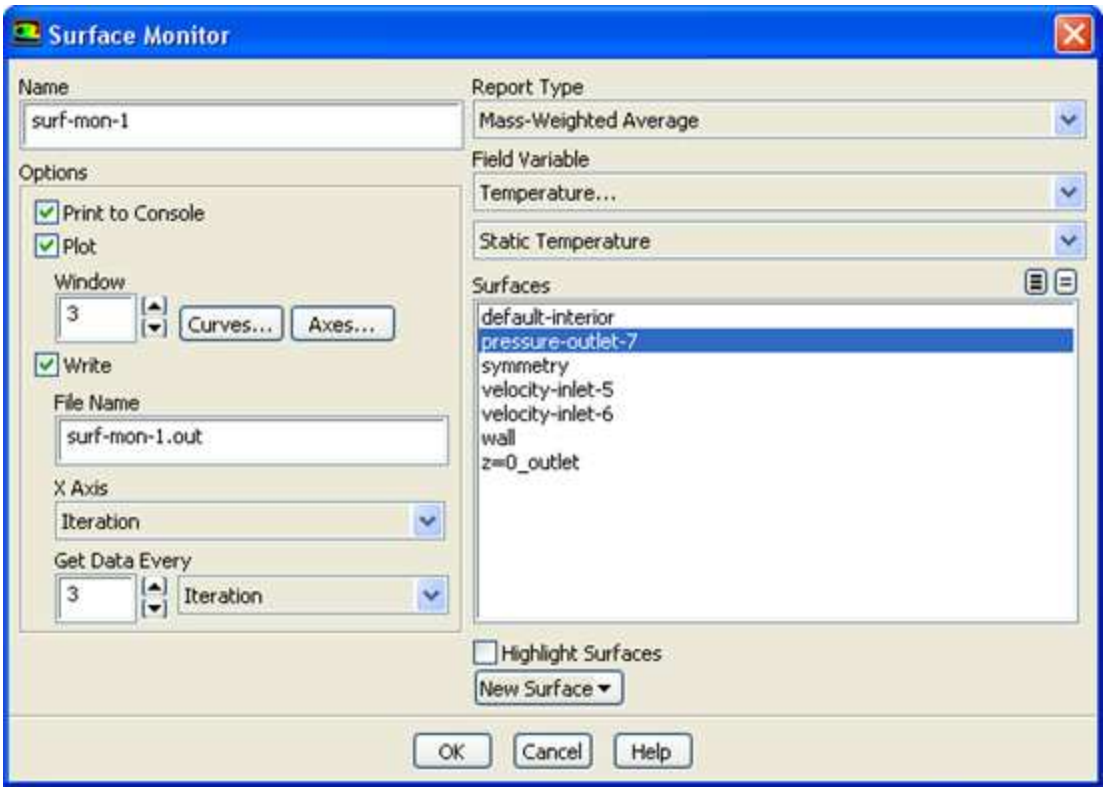
Plot
displays an XY plot of the convergence history of the selected moment coefficient.

Clear
discards the force-monitoring data, including associated files. Each of these actions must be confirmed in a *Question Dialog Box* (p. 32).

35.14.6. Surface Monitor Dialog Box

The **Surface Monitor** dialog box allows you to save the convergence history of the average, integral, flow rate, or mass average (among other quantities) of a field variable on one or more surfaces. You can also use the **Surface Monitor** dialog box define what each surface monitor is tracking. See *Monitoring Surface Integrals* (p. 1283) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the surface monitor.

Options

contains parameters used in saving monitor data.

Print to Console

specifies whether or not to print the data from each surface monitor in the console window.

Plot

specifies whether or not to plot the data from each surface monitor in the graphics window.

Window

sets the window ID in which the plot will be drawn. When ANSYS FLUENT is iterating, the active graphics window is temporarily set to this window to update the surface monitoring plot, and then returned to its previous value. Thus, the surface monitor plot can be maintained in a separate window that does not interfere with other graphical postprocessing.

Curves...

opens the *Curves Dialog Box* (p. 2024) to modify the attributes of the data curves.

Axes...

opens the *Axes Dialog Box* (p. 2022) to modify the attributes of the axes.

Write

specifies whether or not to write the data from each surface monitor to a file.

Important

If you choose *not* to save the surface integration data in a file, this information will be lost when you exit the current ANSYS FLUENT session.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

File Name
specifies the name of the file to which the surface data is written.

X Axis
specifies the x-axis function against which monitored data will be plotted or written. Available options are **Iteration**, **Time Step**, and **Flow Time** (elapsed time).

Get Data Every
indicates the frequency at which you want to plot, print, or write the surface monitor. A default value of 1 will allow you to monitor at every **Iteration** or **Time Step**. **Time Step** is a valid choice only if you are calculating unsteady flow. See *Overview of Defining Surface Monitors* (p. 1283) for details.

Report Type
selects the integration method used on the selected surfaces. The available report types are the same as those in the *Surface Integrals Dialog Box* (p. 2031). See *Surface Integration* (p. 1519) for details.

Field Variable
contains a list of solution variables that can be monitored on the selected surfaces. This list will be deactivated if you select **Mass Flow Rate** or **Volume Flow Rate** as the **Report Type**.

Phase
contains a list of all of the phases in the problem that you have defined. This is available when the VOF, mixture, or Eulerian multiphase model is enabled.

Surfaces
contains a selectable list of the current surfaces.

New Surface
is a drop-down list button that contains a list of surface options:

Point
opens the *Point Surface Dialog Box* (p. 1927).

Line/Rake
opens the *Line/Rake Surface Dialog Box* (p. 1928).

Plane
opens the *Plane Surface Dialog Box* (p. 1929).

Quadric
opens the *Quadric Surface Dialog Box* (p. 1931).

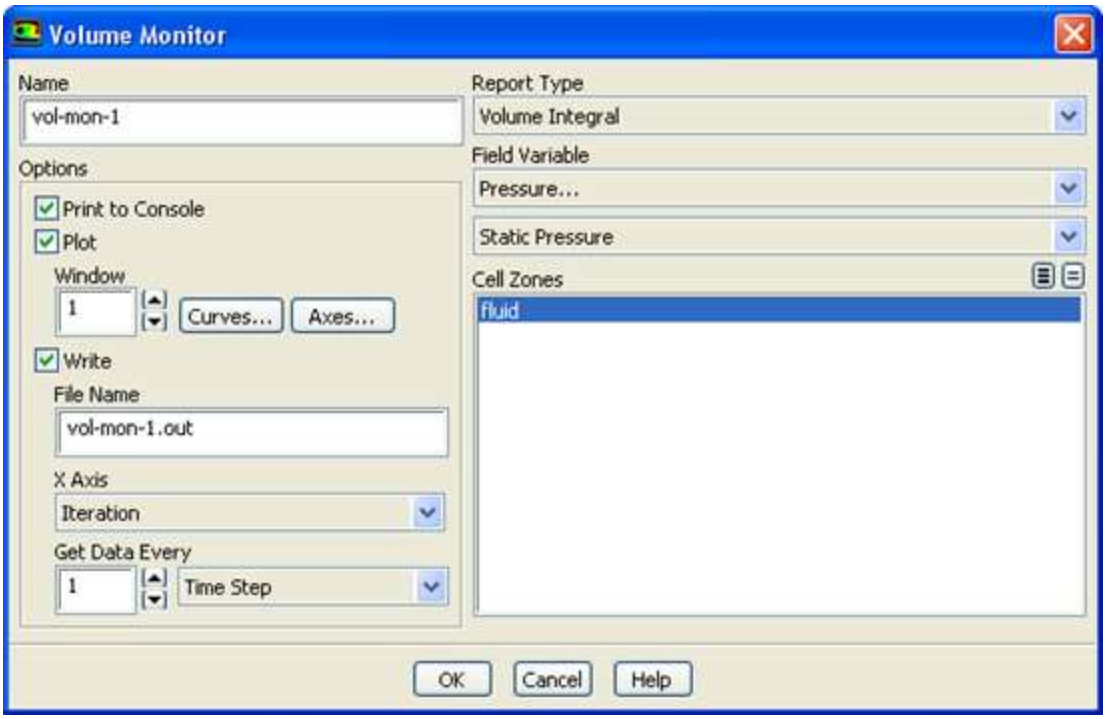
Iso-Surface
opens the *Iso-Surface Dialog Box* (p. 1933).

Iso-Clip
opens the *Iso-Clip Dialog Box* (p. 1935).

35.14.7. Volume Monitor Dialog Box

You can use the **Volume Monitor** dialog box to save the convergence history of the volume, sum, volume integral, mass integral, volume average, or mass average of a field variable on one or more cell zones. You can also define what each volume monitor is tracking. See *Monitoring Volume Integrals* (p. 1286) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Name

specifies the name of the volume monitor.

Options

contains parameters used in saving monitor data.

Print to Console

specifies whether or not to print the data from each volume monitor in the console window.

Plot

specifies whether or not to plot the data from each volume monitor in the graphics window.

Window

sets the window ID in which the plot will be drawn. When ANSYS FLUENT is iterating, the active graphics window is temporarily set to this window to update the volume monitoring plot, and then returned to its previous value. Thus, the volume monitor plot can be maintained in a separate window that does not interfere with other graphical postprocessing.

Curves...

opens the *Curves Dialog Box* (p. 2024) to modify the attributes of the data curves.

Axes...

opens the *Axes Dialog Box* (p. 2022) to modify the attributes of the axes.

Write

specifies whether or not to write the data from each volume monitor to a file.

Important

If you choose *not* to save the volume integration data in a file, this information will be lost when you exit the current ANSYS FLUENT session.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

File Name
specifies the name of the file to which the volume monitor data is written.

X Axis
specifies the x-axis function against which monitored data will be plotted or written. Available options are **Iteration**, **Time Step**, and **Flow Time** (elapsed time).

Get Data Every
indicates the frequency at which you want to plot, print, or write the volume monitor. A default value of 1 will allow you to monitor at every **Iteration** or **Time Step**. **Time Step** is a valid choice only if you are calculating unsteady flow. See *Overview of Defining Surface Monitors* (p. 1283) for details.

Report Type
selects the integration method used on the selected cell zones. The available report types are the same as those in the *Volume Integrals Dialog Box* (p. 2034). See *Volume Integration* (p. 1521) for details.

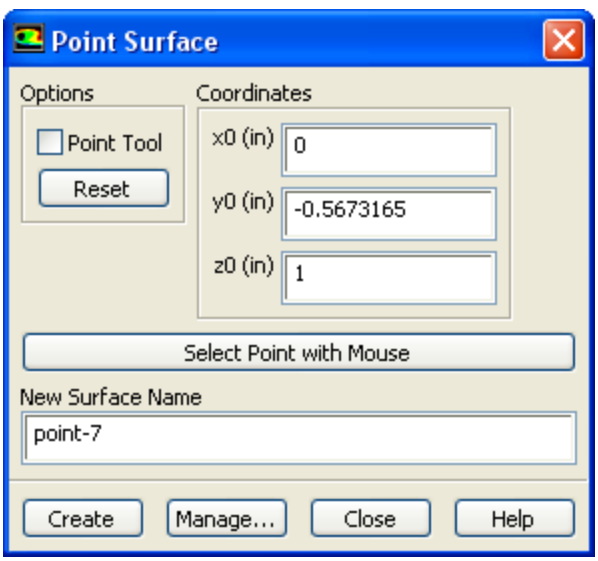
Field Variable
contains a list of solution variables that can be monitored on the selected cell zones. This list will be deactivated if you select **Volume** as the **Report Type**.

Phase
contains a list of all of the phases in the problem that you have defined. This is available when the VOF, mixture, or Eulerian multiphase model is enabled.

Cell Zones
contains a selectable list of the current cell zones.

35.14.8. Point Surface Dialog Box

The **Point Surface** dialog box allows you to interactively create point surfaces (surfaces containing a single data point). See *Point Surfaces* (p. 1359) for details about the items below.



Controls

Options
contains options related to the point tool. See *Using the Point Tool* (p. 1360) for details about using this feature.

Point Tool
activates the point tool.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reset
resets the point tool to its default position.

Coordinates
designates the coordinates of the point in the surface (**x0**, **y0**, **z0**).

Select Point with Mouse
activates the selection of the point with the mouse. You can select a point by clicking on a location in the active window with the mouse-probe button. (See *Controlling the Mouse Button Functions* (p. 1427) for information about setting mouse button functions.)

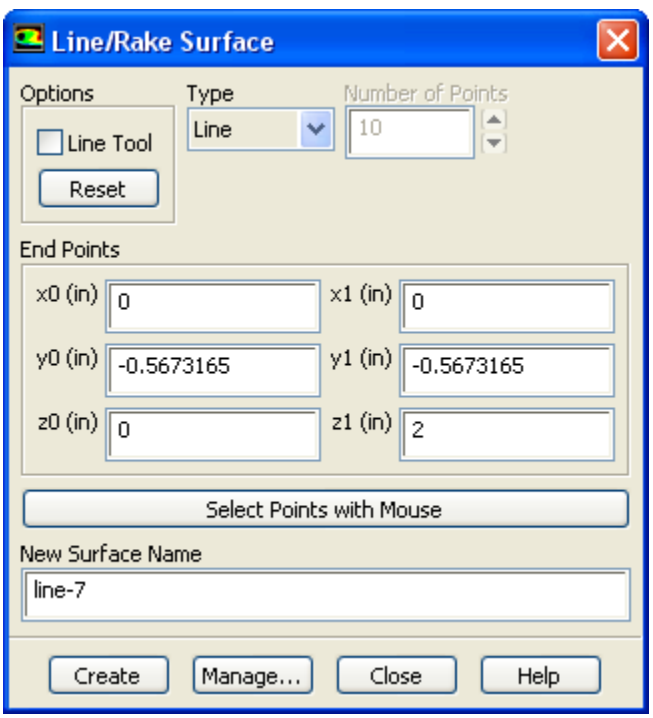
New Surface Name
designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

Create
creates the surface.

Manage...
opens the *Surfaces Dialog Box* (p. 1936) in which you can rename and delete surfaces and determine their sizes.

35.14.9. Line/Rake Surface Dialog Box

The **Line/Rake Surface** dialog box allows you to interactively create line and rake surfaces. A rake is a linear, uniform distribution of points between two endpoints. See *Line and Rake Surfaces* (p. 1361) for details about the items below.



Controls

Options
contains options related to the line tool. See *Using the Line Tool* (p. 1363) for details about using this feature.

Line Tool
activates the line tool.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reset
resets the line tool to its default position.

Type
selects line or rake as the surface to be created.

Number of Points
defines the number of points in the rake surface (inactive for line surfaces).

End Points
designates the coordinates of the first point (**x0**, **y0**, **z0**) and the last point (**x1**, **y1**, **z1**).

Select Points with Mouse
activates the selection of endpoints with the mouse. You can select endpoints by clicking on locations in the active window with the mouse-probe button. (See *Controlling the Mouse Button Functions* (p. 1427) for information about setting mouse button functions.)

New Surface Name
designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

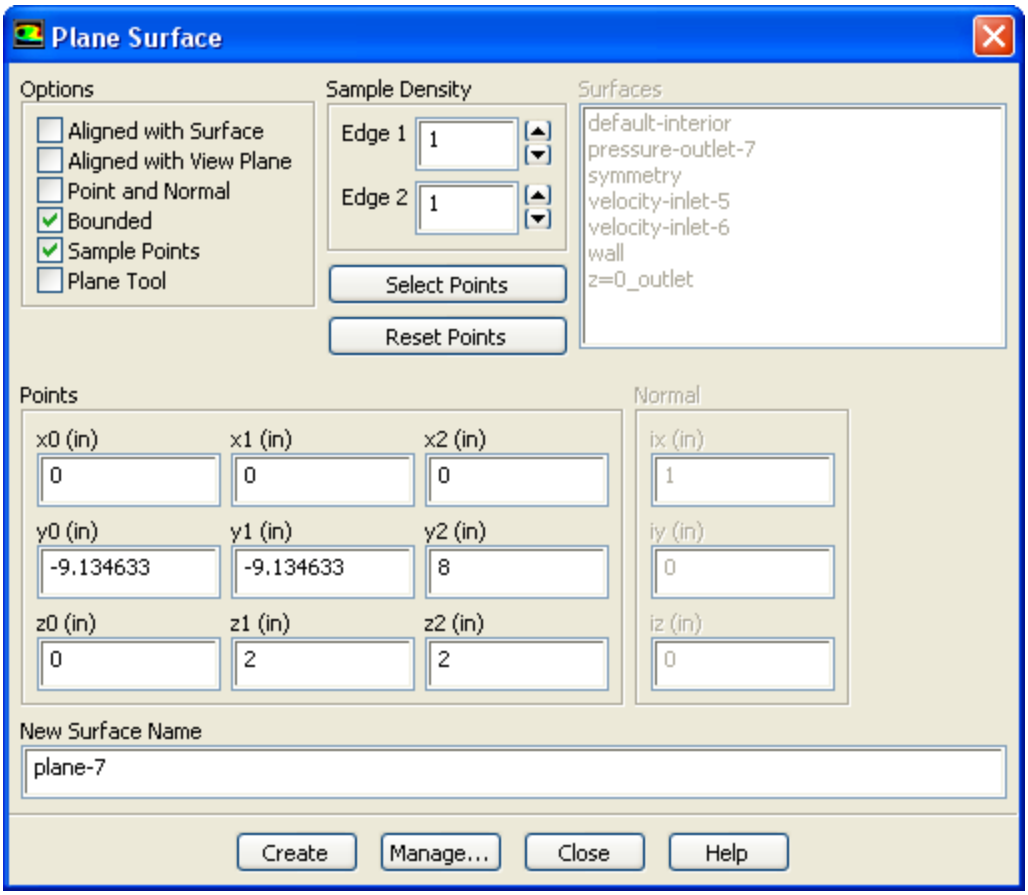
Create
creates the surface.

Manage...
opens the *Surfaces Dialog Box* (p. 1936) in which you can rename and delete surfaces and determine their sizes.

35.14.10. Plane Surface Dialog Box

The **Plane Surface** dialog box allows you to interactively create a planar surface that cuts through the domain. See *Plane Surfaces* (p. 1364) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains options for defining the plane surface.

Aligned with Surface

enables the specification of a plane parallel to an existing surface.

Aligned with View Plane

enables the specification of a plane parallel to the current view in the active graphics window.

Point and Normal

enables the specification of a plane having a certain normal vector and passing through a specified point.

Bounded

enables the creation of a bounded parallelepiped, 3 of whose 4 corners are the 3 points that define the plane equation (or the 4 corners of the **Plane Tool**).

Sample Points

enables the specification of a point density along the 2 directions (of the parallelepiped). This creates a uniformly distributed set of points on the plane. (This item is available only when the **Bounded** option is enabled.)

Plane Tool

activates the plane tool. See *Using the Plane Tool* (p. 1367) for details. This option is not available if you are using the **Aligned With Surface** or **Aligned With View Plane** option.

Sample Density

specifies the density of points when the **Sample Points** option is enabled.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Edge 1, Edge 2
sets the point density along the two directions of the plane. (Edge 1 extends from point 0 to point 1, and edge 2 extends from point 1 to point 2.)

Select Points
activates the selection of points with the mouse. You can select endpoints by clicking on locations in the active window with the mouse-probe button. (See *Controlling the Mouse Button Functions* (p. 1427) for information about setting mouse button functions.)

Reset Points
resets the plane tool to its default position.

Surfaces
contains a list of currently defined surfaces. If you choose the **Aligned With Surface** option, this will become a selectable list, and you can choose the surface with which you want the new plane surface to be aligned.

Points
contains boxes in which you can set the coordinates of the three points defining the planar surface.

x0, y0, z0
designates the coordinates of the first point.

x1, y1, z1
designates the coordinates of the second point.

x2, y2, z2
designates the coordinates of the third point.

Normal
contains boxes in which you can specify the components of the normal vector when the **Point And Normal** option is enabled.

ix, iy, iz
designates the coordinates of the end point of the normal vector (the start point being 0, 0, 0).

New Surface Name
designates the name of the new surface The default is the concatenation of the surface type and an integer which is the new surface ID.

Create
creates the surface.

Manage...
opens the *Surfaces Dialog Box* (p. 1936) in which you can rename and delete surfaces and determine their sizes.

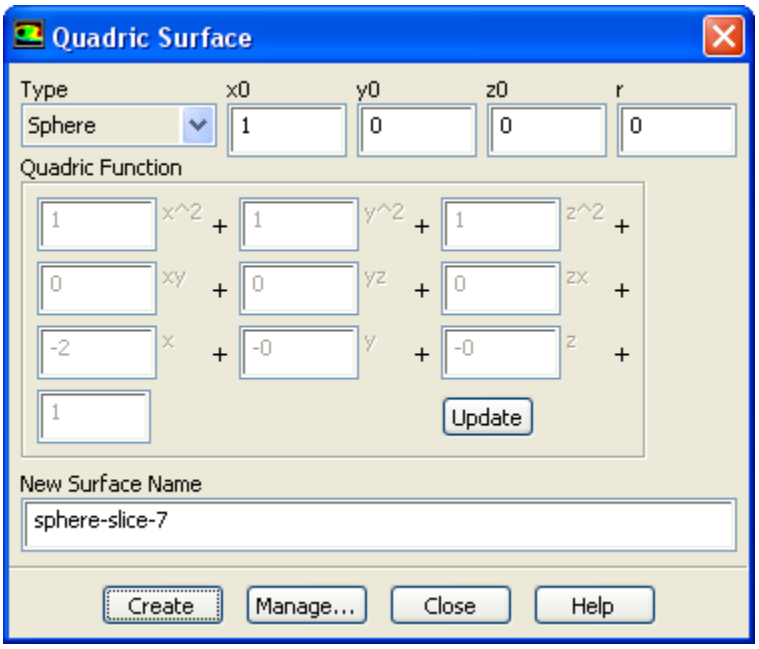
35.14.11. Quadric Surface Dialog Box

The **Quadric Surface** dialog box allows you to interactively define quadric functions and create surfaces from them. Lines and circles are commonly used types of quadric functions, so additional support is provided for defining them. See *Quadric Surfaces* (p. 1369) for details about using the items below.

Important

Note that your inputs for the quadric function must be in SI units.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Type

selects the type of quadric function. Presently, you may select **Line/Plane**, **Circle/Sphere** or a general **Quadric**. Some of the control buttons take on different meanings for each of the three quadric function types.

Line/Plane

specifies that the surface will consist of all points on the domain that satisfy the equation $ix*x+iy*y+iz*z=distance$, where

ix

is the coefficient of x in the quadric function.

iy

is the coefficient of y in the quadric function.

iz

is the coefficient of z in the quadric function.

distance

is the distance of the line/plane from the origin.

When you press the **Update** button in **Quadric Function**, the coefficients in the quadric function will change to reflect your inputs.

Circle/Sphere

specifies that the surface will consist of all points in the domain that satisfy the equation $(x-x0)^2+(y-y0)^2+(z-z0)^2=r^2$, where

x0,y0,z0

are the x,y,z coordinates of the center.

r

is the radius.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

When you press the **Update** button in **Quadric Function**, the coefficients in the quadric function will change to reflect your inputs.

Quadric
specifies that the surface will consist of all points in the domain that satisfy the quadric function $Q = value$, where Q is the quadric function defined by the user as shown below. You will enter **value** to the right of the **Type** entry, but the coefficients in the quadric function are entered directly in the **Quadric Function** box. Note that in 2D problems the z entries are ignored.

x2, y2, z2, xy, yz, zx, x, y, z
are the coefficients of the corresponding terms in the quadric function.

Quadric Function
contains the display of the quadric function and the **Update** button. If you select **Line/Plane** or **Circle/Sphere** as the **Type**, the coefficients of the quadric function will be updated here when you press the **Update** button. You will not be able to edit the values in the **Quadric Function** box directly. If you select **Quadric** as the **Type**, you will enter the coefficients directly in this box, and the **Update** button will be inactive.

Update
updates the coefficients in **Quadric Function** to reflect the current input.

New Surface Name
designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

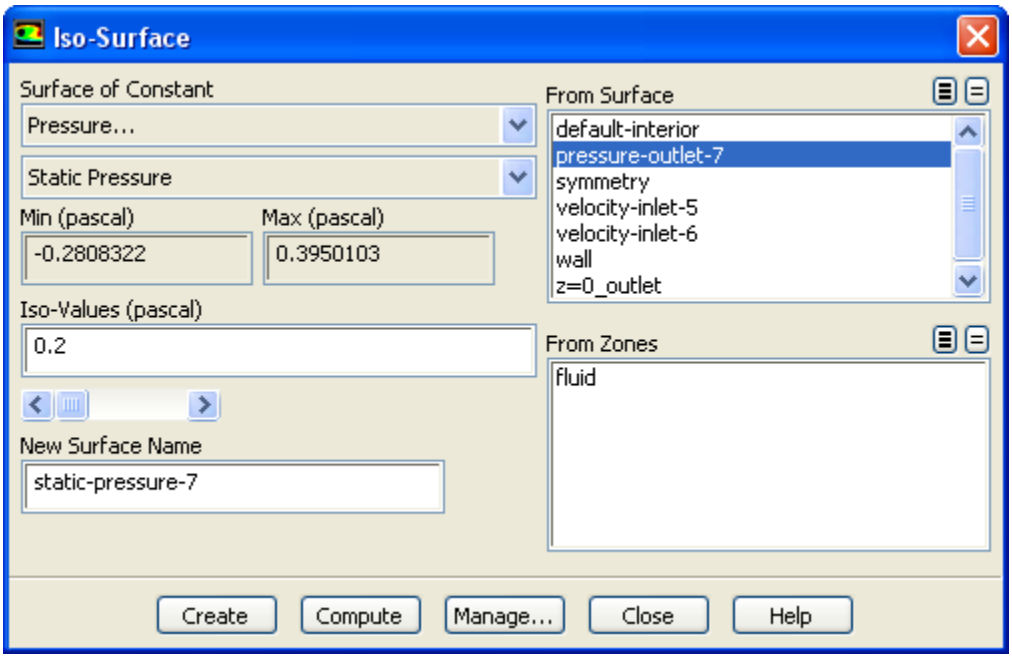
Create
creates the surface.

Manage...
opens the *Surfaces Dialog Box* (p. 1936) in which you can rename and delete surfaces and determine their sizes.

35.14.12. Iso-Surface Dialog Box

The **Iso-Surface** dialog box allows you to interactively create isosurfaces. These surfaces can be isovalued sections of an existing surface or of the entire domain. For more effective use of the slider bar, press the **Compute** button before using it. See *Isosurfaces* (p. 1371) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Surface of Constant

contains a list from which you can select the scalar field which will be used for isosurfacing.

Min

displays the minimum field value, which is computed when you press **Compute**.

Max

displays the maximum field value, which is computed when you press **Compute**.

Iso-Values

sets user-specified isovalues. There are two ways you can set the **Iso-Values**:

- You can set an isovalue interactively by moving the slider with the left mouse button. This will also create a temporary isosurface in the graphics window. Using the slider allows you to preview the isosurfaces before defining them. Note: Even though the isosurface is displayed, it is only a temporary surface. To create an isosurface, use the **Create** button after deciding on a particular isovalue.
- You can type in isovalues in the **Iso-Values** field directly, separating multiple values by white space. Multiple isovalues will be contained in a single isosurface; i.e., you cannot select subsurfaces within the resulting isosurface.

From Surface

contains a list of existing surfaces from which you can select the surface to be used for isosurfacing. If you do not select a surface from the list, the isosurfacing will be performed on the entire domain.

From Zones

contains a list of cell zones from which you can select the zone for creating an isosurface.

New Surface Name

designates the name of the surface to be created. The default is the concatenation of the scalar field name and an integer which is the new surface ID.

Create

creates the surface.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Compute

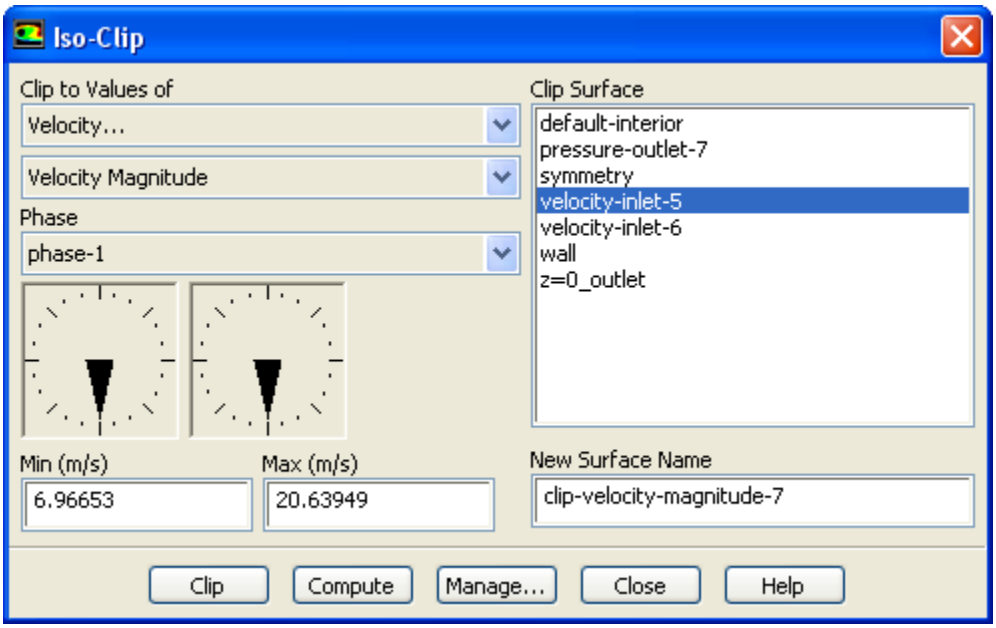
computes the minimum and maximum of the scalar field across the domain and displays them in the **Min** and **Max** boxes.

Manage...

opens the *Surfaces Dialog Box* (p. 1936) in which you can rename and delete surfaces and determine their sizes.

35.14.13. Iso-Clip Dialog Box

The **Iso-Clip** dialog box allows you to interactively clip surfaces. The clipped surface consists of those points on the selected surface where the scalar field values are within the specified range. See *Clipping Surfaces* (p. 1373) for details about the items below.



Controls

Clip to Values of

contains a list from which you can select the scalar field to be used for clipping.

Phase

allows you to select the phase when one of the multiphase models is selected in the *Multiphase Model Dialog Box* (p. 1642).

Min, Max

set the minimum and maximum values in the clipping range. There are two ways you can set the **Min** and **Max**:

- You can set a value interactively by moving the indicator in the dial above the **Min** or **Max** field with the left mouse button. This will also create a temporary surface in the graphics window. Using the dial allows you to preview the clipped surfaces before defining them. Note: Even though the clipped surface is displayed, it is only a temporary surface. To clip the surface, use the **Clip** button after deciding on the minimum and maximum values.
- You can type in values in the **Min** and **Max** fields directly.

Clip Surface

contains a list of surfaces from which you can select the surface to be clipped. You must select a surface to activate the **Clip** push button.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

New Surface Name
designates the name of the surface to be created. The default is the concatenation of the surface type and an integer which is the new surface ID.

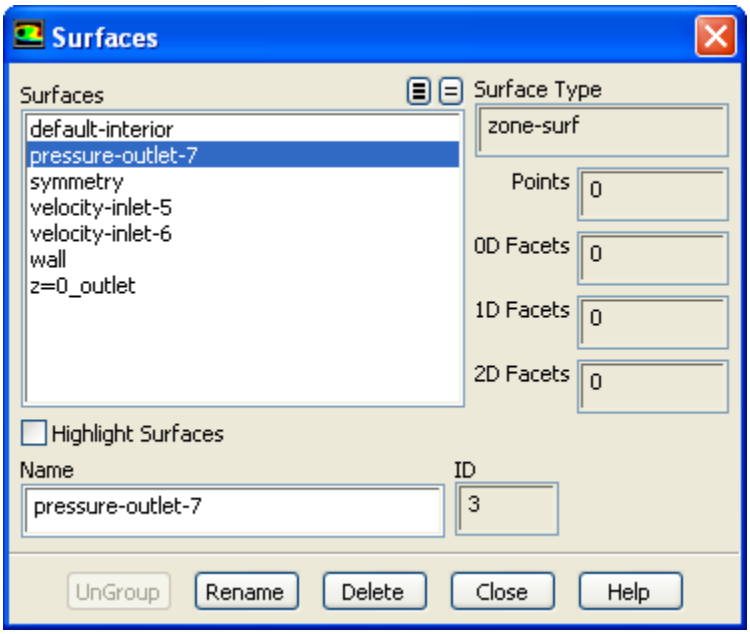
Clip
creates the clipped surface. (The original surface will remain unchanged.)

Compute
computes the minimum and maximum values of the scalar field across the domain, and displays them in the **Min** and **Max** boxes.

Manage...
opens the *Surfaces Dialog Box* (p. 1936) in which you can rename and delete surfaces and determine their sizes.

35.14.14. Surfaces Dialog Box

The **Surfaces** dialog box allows you to interactively group, rename, and delete surfaces and obtain information about their components. See *Grouping, Renaming, and Deleting Surfaces* (p. 1376) for details about the items below.



Controls

Surfaces
contains a list of existing surfaces from which you can select the surface(s) of interest.

Name
displays the name of the selected surface. You can edit the text field to modify the surface name. (If more than one surface is selected, the name of the first one you selected will be displayed.)

Surface Type
displays the type of surface that is selected (e.g., `zone-surf` if one surface is selected, or `Multiple Surfaces` if more than one surface is selected).

Points, 0D Facets, 1D Facets,
and **2D Facets** display the number of points and facets in the selected surface. If more than one surface is selected, the sum over all selected surfaces is displayed for each quantity.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note that if you want to check these statistics for a surface that was read from a case file, you will need to first display it.

Highlight Surfaces
when enabled highlights the surfaces (selected in the **Surfaces** dialog box) in the graphics window.

ID
displays the ID of the selected surface. You cannot change this value.

UnGroup
ungroups the selected surface. This button is available only if the selected surface was created by **Group**ing two or more surfaces together.

Rename
renames the selected surface in **Surfaces** with the name specified in **Name**. This button is available when just one surface is selected. (If two or more surfaces are selected, it becomes the **Group** button.)

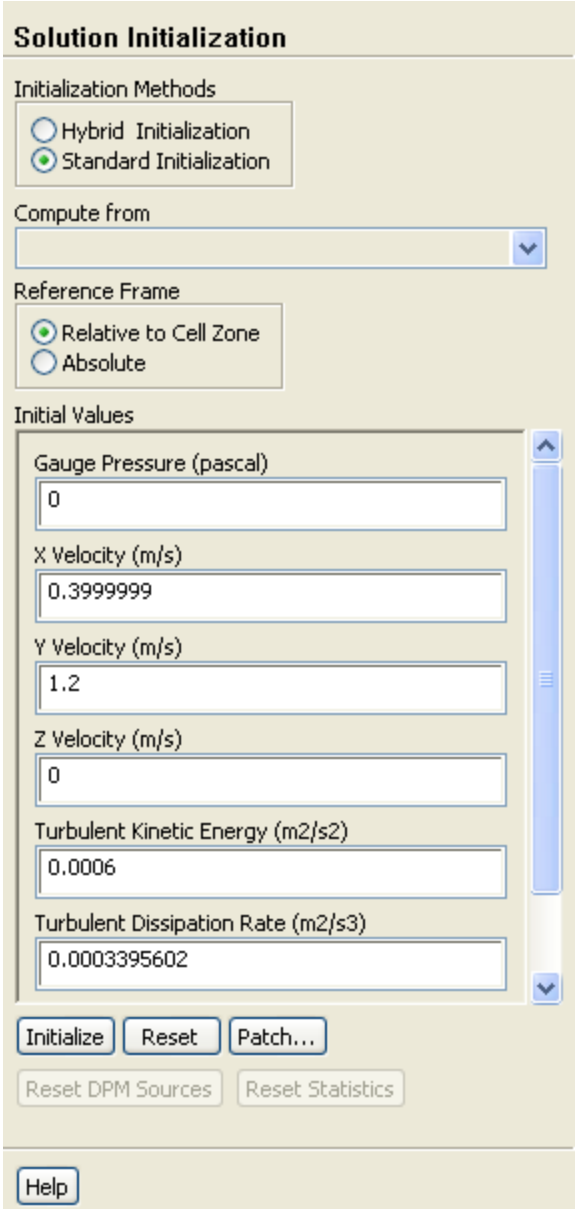
Group
groups two or more selected surfaces and gives the group the name entered in **Name**. This button replaces the **Rename** button when two or more surfaces are selected.

Delete
deletes the selected surface(s).

35.15. Solution Initialization Task Page

The **Solution Initialization** task page allows you to define values for flow variables and initialize the flow field to these values. See *Initializing the Entire Flow Field Using Standard Initialization* (p. 1240) for details about using this dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Initialization Method

allows you to choose between **Hybrid Initialization** and **Standard Initialization**.

Hybrid Initialization

is a collection of boundary interpolation methods, where variables, such as temperature, turbulence, species fractions, volume fractions, etc., are automatically patched based on domain averaged values or a particular interpolation recipe (see *Hybrid Initialization* (p. 1245)).

Standard Initialization

allows you to define values for flow variables and initialize the flow field to these values.

Compute from

is a drop-down list of zones; the default values for applicable variables will be computed from information contained in the zone that you select from this list. The computation will occur when you select the required zone, and the variable values will be displayed in **Initial Values**. You can also choose the **all-zones** item in this list to compute average values based on all zones.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reference Frame
indicates whether the initial velocities are absolute velocities (**Absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

Initial Values
displays the initial values of applicable variables. You can use **Compute from** to compute values from a particular zone, or you can enter values directly.

Initialize
initializes the entire flow field to the values listed.

Reset
resets the fields to their "saved" values.

Patch...
opens the *Patch Dialog Box* (p. 1939).

Reset DPM Sources
allows you to reset the interphase sources/sinks of momentum, heat, and/or mass to zero. This item is available when you perform coupled discrete phase calculations. See *Resetting the Interphase Exchange Terms* (p. 1067) for details.

Reset Statistics
can be used to both initialize the flow statistics and reset the flow statistics after you have gathered some data for time statistics. This item is available when you perform unsteady calculations and have enabled the **Data Sampling for Time Statistics** option in the *Run Calculation Task Page* (p. 1955). See *User Inputs for Time-Dependent Problems* (p. 1256)for details.

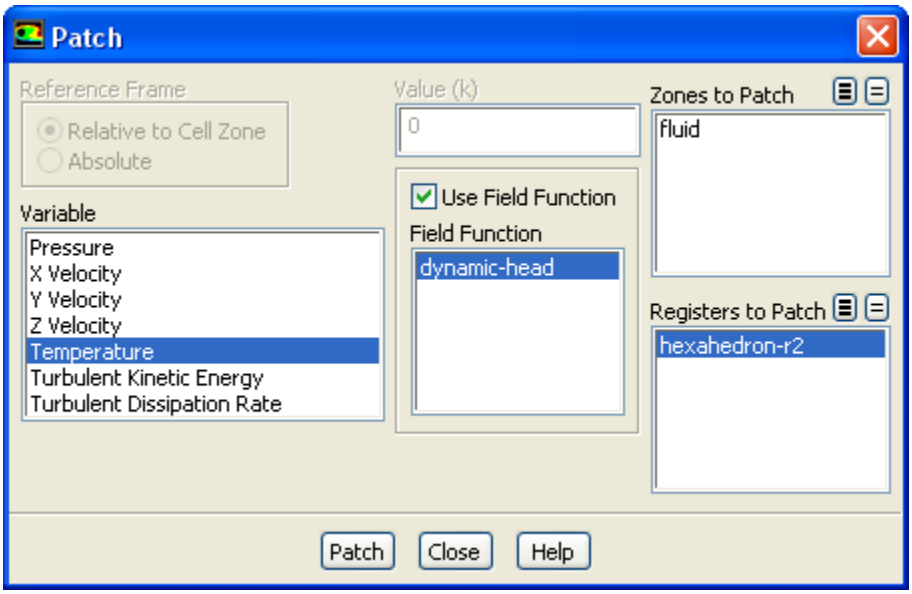
More Settings...
opens the *Hybrid Initialization Dialog Box* (p. 1941). This button is available only when **Hybrid Initialization** is the selected method.

For additional information, please see the following sections:
35.15.1. Patch Dialog Box
35.15.2. Hybrid Initialization Dialog Box

35.15.1. Patch Dialog Box

The **Patch** dialog box allows you to patch different values of flow variables into different cells. See *Patching Values in Selected Cells* (p. 1242) for details about using this feature.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Reference Frame

indicates whether patched velocities are absolute velocities (**Absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent. Also, this selection affects only velocities, so the options will not be available unless you have selected a velocity in the **Variable** list.

Phase

contains a list of all of the phases in the problem that you have defined. This is available when the VOF, mixture, or Eulerian multiphase model is enabled.

Variable

contains a list of flow variables from which you can choose the variable to be patched.

Value

sets a constant value to be patched for the selected **Variable**.

Use Field Function

enables the patching of a custom **Field Function**, rather than a constant **Value**, for the selected **Variable**. See *Using Field Functions* (p. 1243) for details.

Field Function

contains a list of defined custom field functions. If the **Use Field Function** option is enabled, you can patch one of these functions for the selected **Variable**. See *Using Field Functions* (p. 1243) for details.

Zones to Patch

contains a list of cell zones. The specified **Value** or **Field Function**for the selected **Variable** will be patched into the zones you select from this list.

Registers to Patch

contains a list of cell registers that have been created using the adaption tools. You can patch a different value for a group of cells within a single cell zone by selecting a register containing a subset of the cells in the zone. See *Using Registers* (p. 1243) for details.

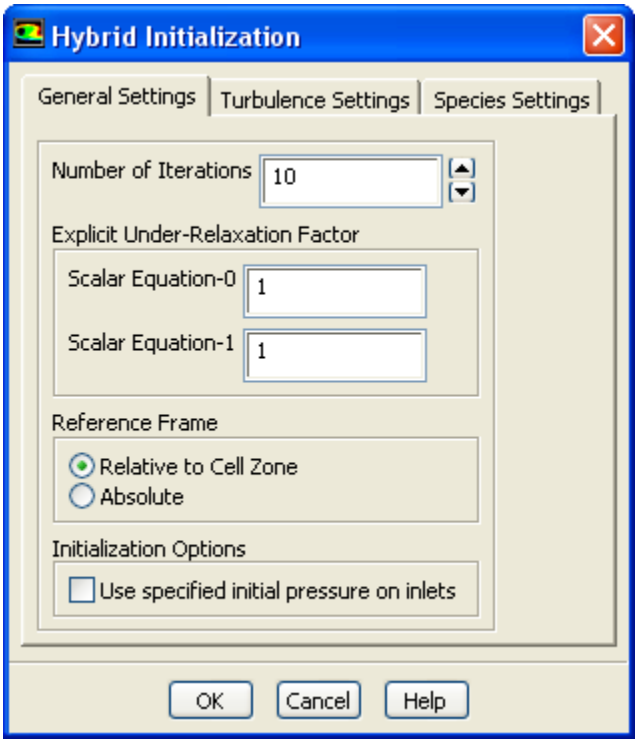
Patch

updates the flow-field data based on the inputs above.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.15.2. Hybrid Initialization Dialog Box

The **Hybrid Initialization** dialog box contains a host of adjustable settings which control the **Hybrid Initialization** strategy.



Controls

General Settings

allow you to adjust such entries as the number of iterations and under-relaxation factors.

Number of Iterations

uses a default value of 10. This is the number of iterations that will be performed while solving the Laplace equations to initialize the velocity and pressure. If the initialized velocity and pressure fields are not to your liking, you may want to increase the number of iterations and re-initialize the solution.

Explicit Under-Relaxation Factor

uses a default value of 1. This value will be used while solving the Laplace equation to initialize the velocity and pressure. If the initialized velocity and pressure fields are not to your liking, you may want to adjust the under-relaxation factor and re-initialize the solution.

Reference Frame

indicates whether the initial velocities are absolute velocities (**Absolute**) or velocities relative to the motion of each cell zone (**Relative to Cell Zone**). This selection is necessary only if your problem involves moving reference frames or sliding meshes. If there is no zone motion, both options are equivalent.

Initialization Option

can be enabled if you want that the specified pressure for **Supersonic/Initialization Gauge Pressure** at the inlet boundaries to be used.

Turbulence Settings

uses by default the domain averaged values for the turbulence parameters. If you want to use variable turbulence parameters you can deselect the **Average Turbulent Parameters** check box. When this option

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

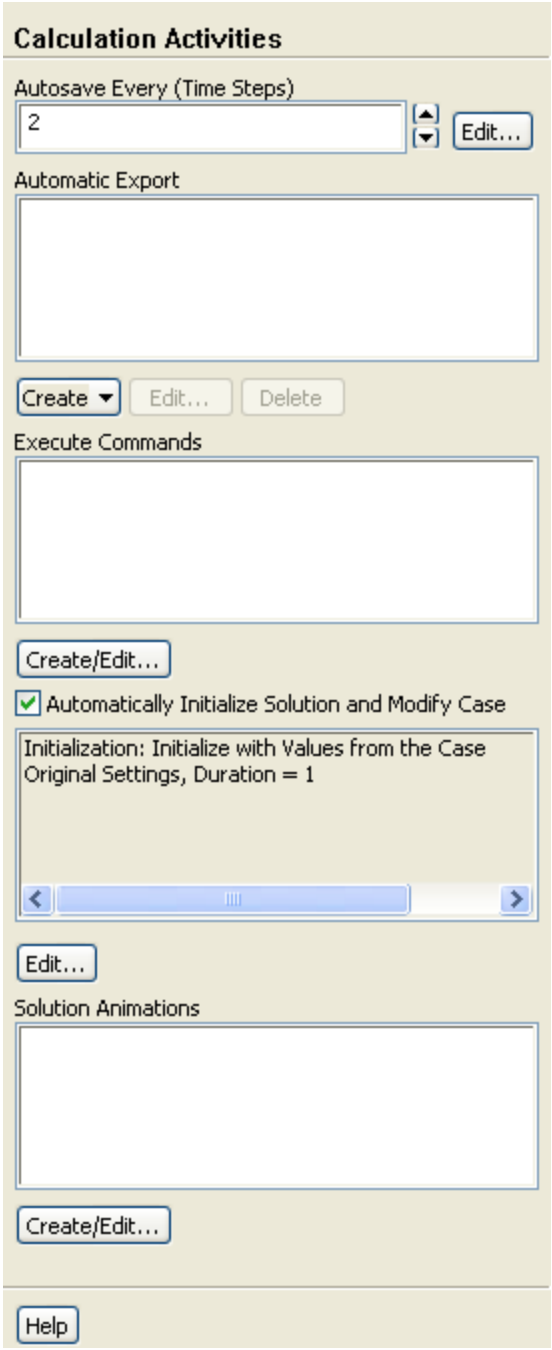
is disabled, then it calculates the turbulent parameters, such as kinetic energy, dissipation energy, etc., using local flow parameters.

Species Settings

will by default initialize secondary species with zero mass or mole fractions. If you want to specify the appropriate value for the species, you will need to enable **Specify Species Parameters**.

35.16. Calculation Activities Task Page

The **Calculation Activities** task page allows you to set up various tasks that you can perform during the calculation, such as saving files, exporting files, creating solution animations, and command execution.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Autosave Every
allows you to set the frequency of the autosave.

Edit...
opens the *Autosave Dialog Box* (p. 1943).

Automatic Export
displays a list of available export objects that will be executed during the calculations. This list and its associated buttons are only available for transient flow calculations.

Create
provides a drop-down list that contains options for creating export objects. Two options are available: the **Solution Data Export** option opens the *Automatic Export Dialog Box* (p. 1946); the **Particle History Data Export** option opens the *Automatic Particle History Data Export Dialog Box* (p. 1949).

Edit...
opens the appropriate dialog box for the selected item in the **Automatic Export** list.

Delete
removes the selected item from the **Automatic Export** list.

Execute Commands
lists available commands to be executed during the calculations.

Create/Edit...
opens the *Execute Commands Dialog Box* (p. 1950).

Automatically Initialize Solution and Modify Case
allows you to automatically have your solution initialized and your case file modified.

Edit...
opens the *Automatic Solution Initialization and Case Modification Dialog Box* (p. 1952). This button is only available when the **Automatically Initialize Solution and Modify Case** option is enabled.

Solution Animations
lists available solution animations.

Create/Edit...
opens the *Solution Animation Dialog Box* (p. 1953).

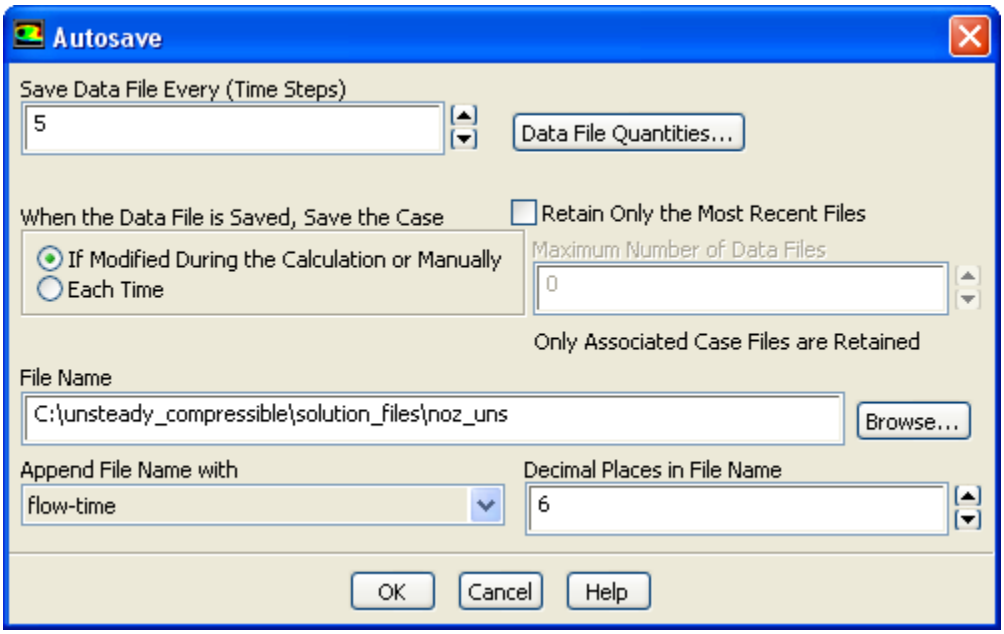
For additional information, please see the following sections:

35.16.1. Autosave Dialog Box
35.16.2. Data File Quantities Dialog Box
35.16.3. Automatic Export Dialog Box
35.16.4. Automatic Particle History Data Export Dialog Box
35.16.5. Execute Commands Dialog Box
35.16.6. Define Macro Dialog Box
35.16.7. Automatic Solution Initialization and Case Modification Dialog Box
35.16.8. Solution Animation Dialog Box
35.16.9. Animation Sequence Dialog Box

35.16.1. Autosave Dialog Box

The **Autosave** dialog box allows you to specify automatic saving of case and data files at specified intervals during a calculation. See *Automatic Saving of Case and Data Files* (p. 65) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Save Data File Every

specifies the frequency with which data files are saved. For steady flows you will specify the frequency in iterations, while for unsteady flows you will specify it in time steps (unless you are using the explicit time stepping formulation, in which case you will specify the frequency in iterations). The default value is set to zero, indicating that no automatic saving is performed.

When the Data File is saved, Save the Case

gives you the choice to save the case file only if it is modified or each time that the data file is saved.

If Modified During the Calculation or Manually

will result in ANSYS FLUENT saving a case file whether you make a manual change, or if ANSYS FLUENT makes a change to the code internally during the calculation.

Each Time

allows you to save the case file every time the data file is saved.

Retain Only the Most Recent Files

allows you to restrict the number of files saved by ANSYS FLUENT if you have limited disk space. When this option is enabled, you can enter the appropriate value in the **Maximum Number of Data Files** field.

Only the associated case files are retained when using this option.

Data File Quantities

opens the *Data File Quantities Dialog Box* (p. 1945) where you can specify which quantities you want to automatically save to a data file for postprocessing.

Maximum Number of Data Files

specifies the maximum number of data files that can be saved at any instance. If you have constraints on the disk space, you can restrict the number of files to be saved using this field. After saving the specified number of files, ANSYS FLUENT will overwrite the earliest existing file. The default value for this field is zero which saves all the files.

File Name

specifies the root name for the files that are saved. The iteration or time-step number and an appropriate suffix (`.cas` or `.dat`) will be added to the specified root name. If the specified **File Name** ends in `.gz`

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

or .Z, appropriate file compression will be performed. (See *Reading and Writing Compressed Files* (p. 59) for details about file compression.)

Append File Name with

allows you to select **flow-time** or **time-step** to be appended to the file name. This option is available only for unsteady-state calculations. The default selection is **flow-time**.

Decimal Places in File Name

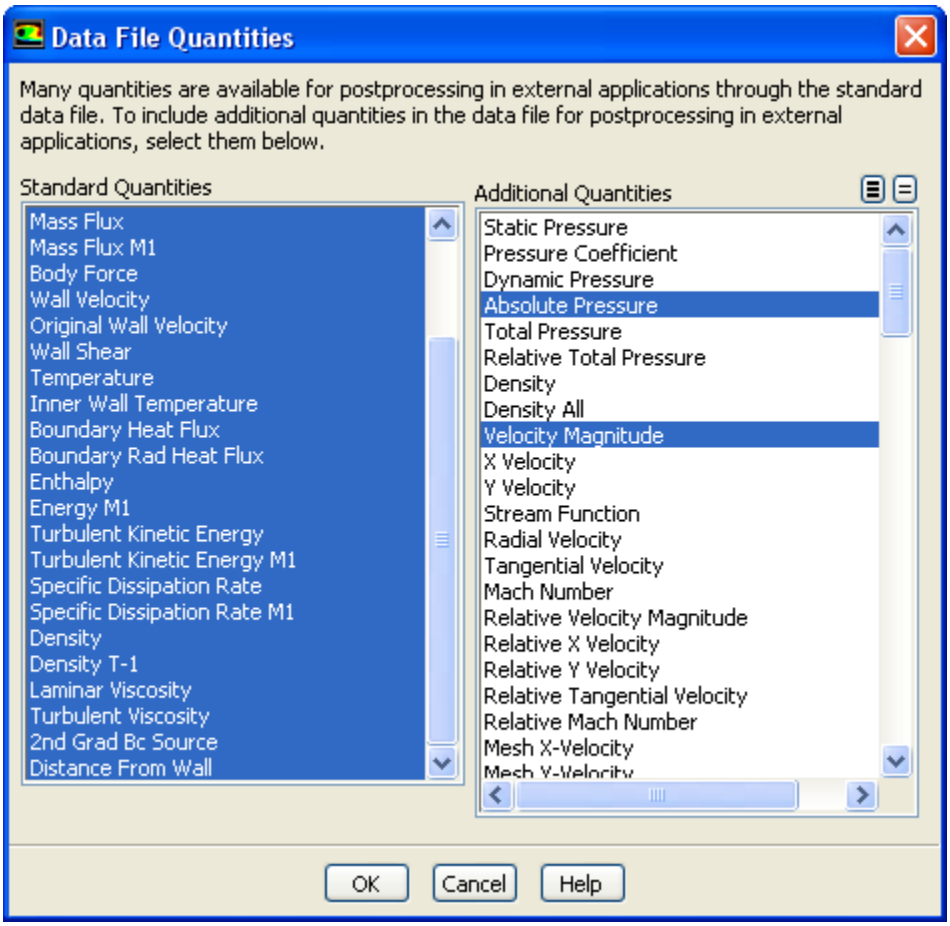
allows you to specify the number of decimal digits in the file name. This option is available only when **flow-time** is selected in the **Append File Name with** drop-down list. The default value for this field is set to 6.

Important

The **Autosave** dialog box is slightly different when running ANSYS FLUENT within ANSYS Workbench. For more information, see the separate ANSYS FLUENT in **Workbench** User's Guide.

35.16.2. Data File Quantities Dialog Box

The **Data File Quantities** dialog box allows you to specify various quantities for postprocessing. See *Setting Data File Quantities* (p. 121) for details.



Controls

Standard Quantities

contains a listing of standard postprocessing quantities (e.g., density, Mach number, temperature, etc.).

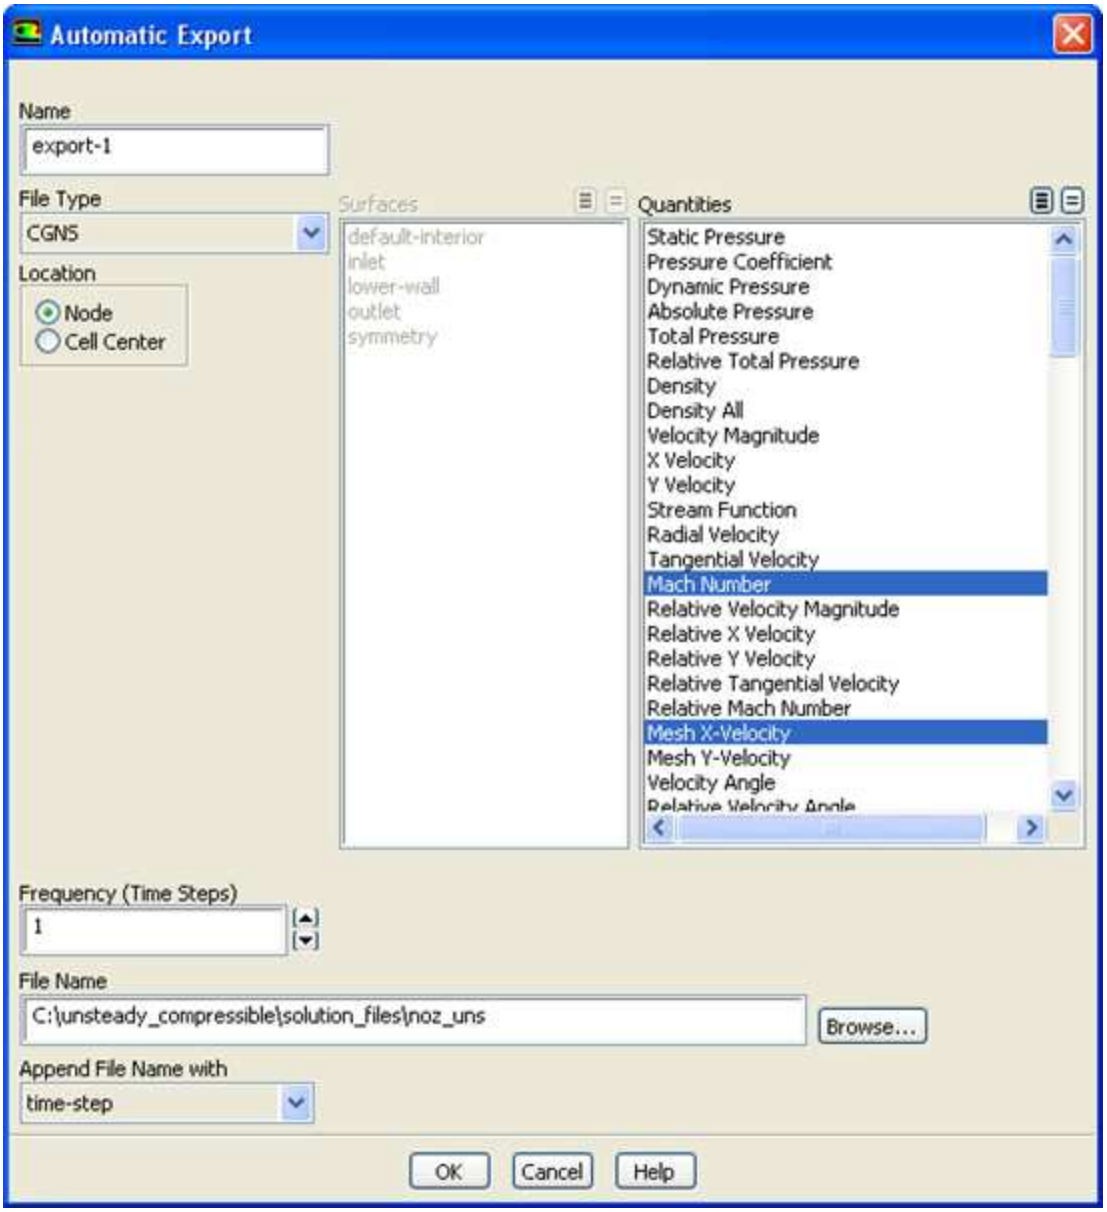
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Additional Quantities

contains a listing of additional postprocessing quantities that are derived from the standard quantities (e.g., standard pressure, velocity magnitude, etc.).

35.16.3. Automatic Export Dialog Box

The **Automatic Export** dialog box allows you to create an automatic export definition for solution data. See *Creating Automatic Export Definitions for Solution Data* (p. 100) for details.



Controls

Name

specifies the name of the export definition.

File Type

contains a drop-down list of file types, which control the output file format that will be written.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ABAQUS
allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to an ABAQUS file (extension `.inp`).

ASCII
allows you to specify the surface(s), scalars, location from which the values of scalar functions are to be taken, and the delimiter separating the fields, to be exported to an **ASCII** file.

AVS
allows you to specify the scalars you want to write to be exported to an AVS file.

CFD-Post Compatible
allows you to specify the scalars you want to write to be exported to a file compatible to the **CFD-Post** application.

CGNS
allows you to specify the scalars you want to write and the location from which the values of scalar functions are to be taken, to be exported to a **CGNS** file (extension `.cgns`).

Data Explorer
allows you to specify the surface(s) and the scalars you want to write to be exported to a Data Explorer file (extension `.dx`).

EnSight Case Gold
allows you to specify the scalars you want to write, the location from which the values of scalar functions are to be taken, and the file format, to be exported to an EnSight file (extension `.geo`, `.vel`, `.scl1`, or `.encas`).

FAST
allows you to specify the scalars you want to write, to be exported as a grid file (Plot3D format), a velocity file, and a scalar file. This option is available only for a triangular or tetrahedral mesh.

FAST Solution
allows you to export a single file containing density, velocity, and total energy data. This option is available only for a triangular or tetrahedral mesh.

Fieldview Unstructured
allows you to specify the scalars you want to write, to be exported to a

I-deas Universal
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to an I-deas Universal file.

Mechanical APDL Input
allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to a Mechanical APDL Input file (extension `.cdb`).

NASTRAN
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a NASTRAN file (extension `.bdf`).

PATRAN
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a PATRAN neutral file (extension `.out`).

RadTherm
allows you to specify the surface(s) for which you want to write data and the method of writing the heat transfer coefficient, to be exported to a PATRAN neutral file (extension `.neu`). This option is available only when the **Energy Equation** is enabled.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Tecplot
allows you to specify the surface(s) and the scalars you want to write, to be exported to a Tecplot file.

Surfaces
specifies the surfaces for which data is to be written for an **ABAQUS**, **ASCII**, Data Explorer, I-deas Universal, **Mechanical APDL Input**, NASTRAN, PATRAN, **RadTherm**, or Tecplot file.

Quantities
specifies valid quantities for output. The attributes of the list are modified based on the active file type. The list may be a single-selection or a multiple-selection list or it may be disabled, depending on the selected **File Type**.

Analysis (for ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN formats)
specifies the finite element analysis intended.

Structural
specifies structural analysis and allows you to select the **Structural Loads** to be written.

Thermal
specifies thermal analysis and allows you to select the **Thermal Loads** to be written.

Structural Loads
contains optional structural loads that can be written to **ABAQUS**, I-deas Universal, **Mechanical APDL Input**, NASTRAN, and PATRAN files. This option is available only when **Structural** analysis is selected.

Force
enables force to be written as a load for a structural analysis.

Pressure
enables pressure to be written as a load for a structural analysis.

Temperature
enables temperature to be written as a load for a structural analysis. This option is available only when the **Energy Equation** is enabled.

Thermal Loads
contains optional thermal loads that can be written to **ABAQUS**, I-deas Universal, **Mechanical APDL Input**, NASTRAN, and PATRAN files. This option is available only when **Thermal** analysis is selected.

Temperature
enables temperature to be written as a load for a thermal analysis.

Heat Flux
enables heat flux to be written as a load for a thermal analysis.

Heat Trans Coeff
enables heat transfer coefficient to be written as a load for a thermal analysis.

Location (for ASCII, CGNS, and EnSight Case Gold formats)
specifies the location from which the values of scalar functions are to be taken.

Node
specifies that data values at the node points are to be exported.

Cell Center
specifies that data values from the cell centers are to be exported.

Format (for CFD-Post Compatible and EnSight Case Gold)
specifies the file format.

Binary
specifies the file format as binary.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

ASCII
specifies the file format as ASCII.

Heat Transfer Coefficient (for RadTherm format only)
specifies the basis for the heat transfer coefficient exported.

Flux Based
specifies the flux based method for writing the heat transfer coefficient.

Wall Function
specifies the wall function based method for writing the heat transfer coefficient.

Frequency (Time Steps)
specifies the frequency for appending the data during the solution process.

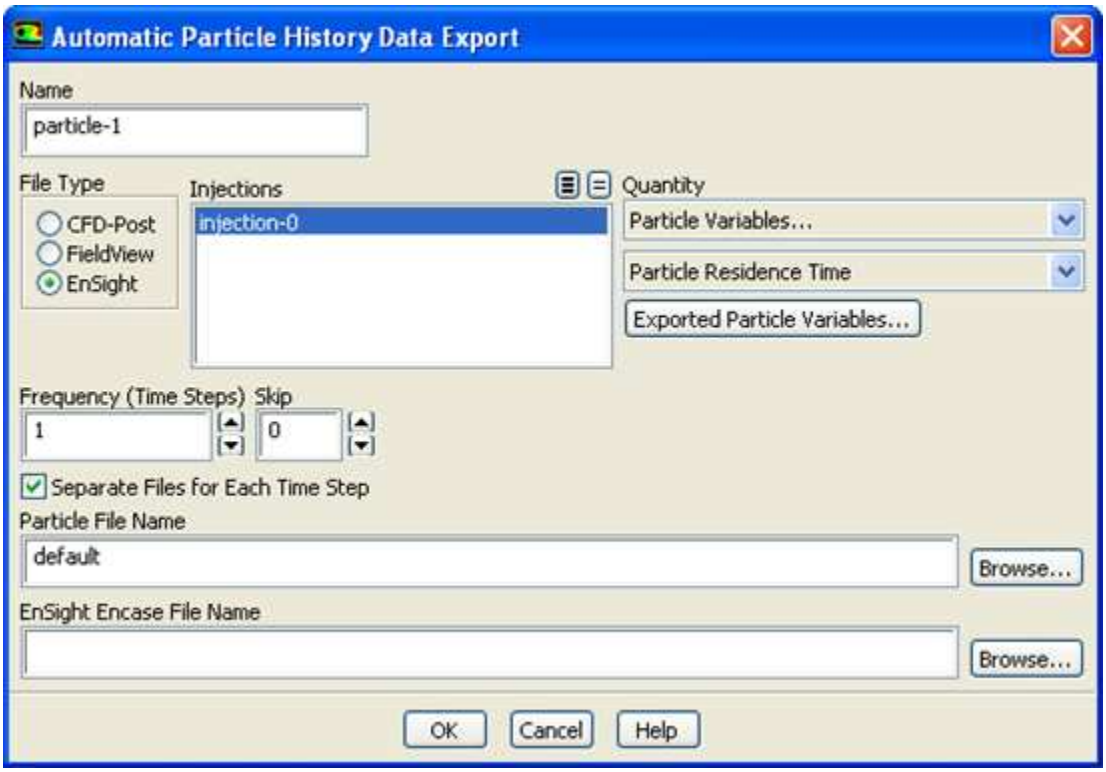
File Name
specifies the root name for the files to be saved.

Append File Name with
allows you to select **flow-time** or **time-step** to be appended to the file name.

Decimal Places in File Name
allows you to specify the number of decimal digits in the file name. This option is available only when **flow-time** is selected in the **Append File Name with** drop-down list. The default value for this field is set to 6.

35.16.4. Automatic Particle History Data Export Dialog Box

The **Automatic Particle History Data Export** dialog box allows you to create an automatic particle history export definition for solution data. See *Creating Automatic Export Definitions for Transient Particle History Data* (p. 102) for details.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name
specifies the name of the particle history export definition.

File Type
specifies the type of the file you want to write.

CFD-Post
allows you to write the file in CFD-Post particle tracks format, which can be read in **CFD-Post**.

FieldView
allows you to write the file in **FIELDVIEW** format, which can be read in **FIELDVIEW**.

EnSight
allows you to write the file in **EnSight** format.

Injections
allows you to select the required injection from the list of predefined injections.

Quantity
contains the list of variables for which you can export the particle data.

Skip
allows you to "thin" or "sample" the number of particles that are exported.

Frequency (Time Steps) or (DPM Iterations)
specifies the frequency of particle time steps that are used for saving the export file.

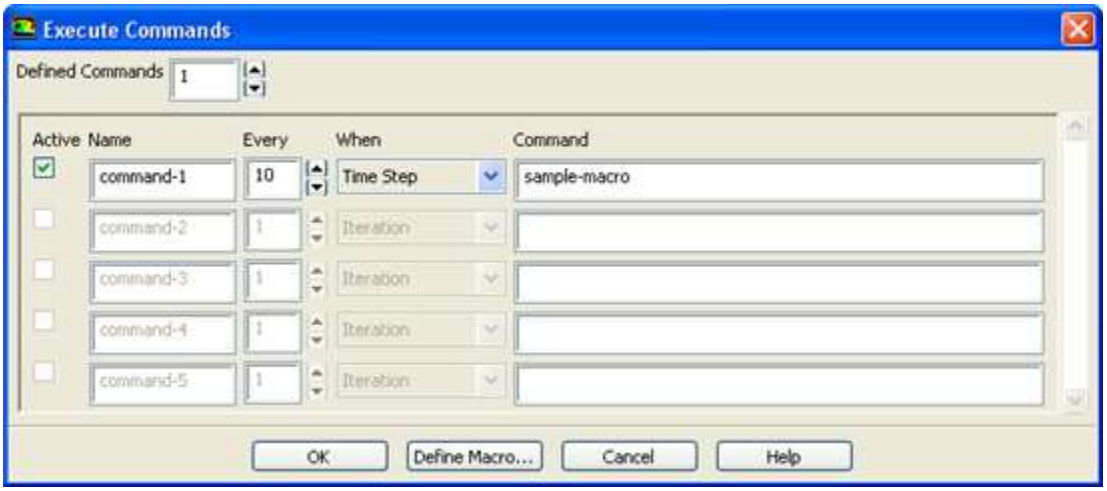
Separate Files for Each Time Step
allows you to have separate exported data files for each time step. Available only when **EnSight** is selected as the **File Type**.

Particle File Name
allows you to specify the file name/directory for the exported data, using the **Browse...** button.

Ensight Encas File Name
is the file name you will specify if you selected **EnSight** under **File Type**. Use the **Browse...** button to select the `.encas` file that was created when you exported the file with the **File/Export...** menu option.

35.16.5. Execute Commands Dialog Box

The **Execute Commands** dialog box allows you to define commands to be executed during the calculation. See *Executing Commands During the Calculation* (p. 1288) for details about using this feature.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Defined Commands
sets the total number of monitor commands to be defined.

Active
activates/deactivates the execution of each command.

Name
specifies a name for each command.

Every, When
indicate how often the command is to be executed. You can enter the interval under **Every**and select **Iteration** or **Time Step** under **When**. (**Time Step** is a valid choice only if you are calculating unsteady flow.)

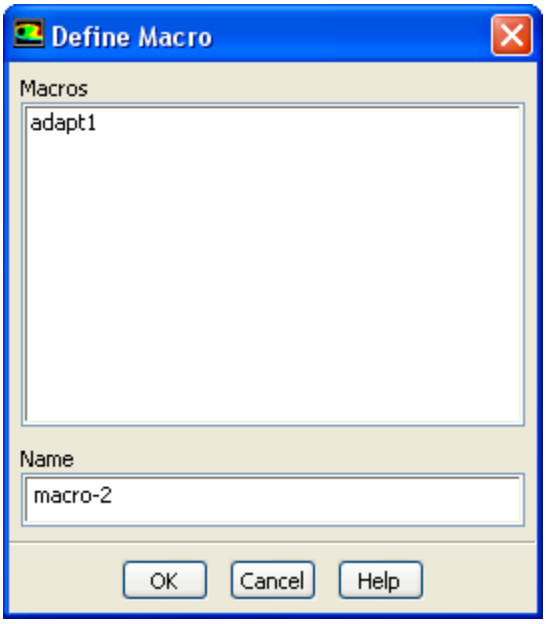
Command
specifies the command to be executed. You can enter text commands or the name of a command macro that you have defined in the *Define Macro Dialog Box* (p. 1951).

Define Macro...
opens the *Define Macro Dialog Box* (p. 1951), in which you can define command macros.

End Macro
ends the definition of a macro. (This button will replace the **Define Macro...**button when you click **OK** in the **Define Macro** dialog box.)

35.16.6. Define Macro Dialog Box

The **Define Macro** dialog box allows you to define macros for automatic execution by the command monitor, or for interactive use by you. See *Defining Macros* (p. 1290) for details.



Controls

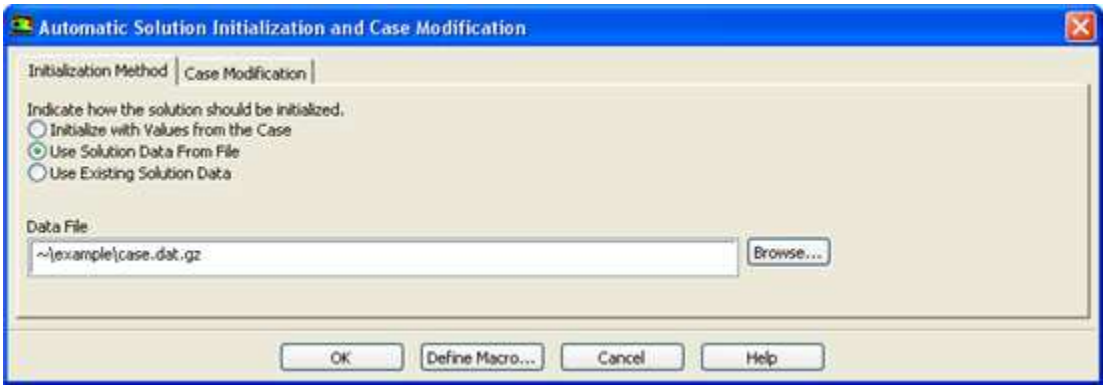
Macros
contains a selectable list of the currently-defined macros.

Name
specifies a name for the command macro.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.16.7. Automatic Solution Initialization and Case Modification Dialog Box

The **Automatic Solution Initialization and Case Modification** dialog box allows you to specify the solution initialization method and to modify the case. See *Automatic Initialization of the Solution and Case Modification* (p. 1292) for details.



Controls

Initialization Method
tab contains several choices for initializing the solution.

Initialize with Values from the Case
uses the values set in the **Solution Initialization** task page.

Use Solution Data From File
requires you to read in a data file containing the desired initialization for the case.

Use Solution Data From Previous Parametric Run with Workbench
(transient cases only) requires you to select one of two methods to initialize the first run. You can **Initialize with Values from the Case**, which uses the values set in the **Solution Initialization** task page. Otherwise, you can **Use Solution Data from File**, which requires you to read in a data file containing the desired initialization for the case.

Use Existing Solution Data
is analogous to changing the values in a case and continuing the calculation. However, the iteration counter will be reset to 0 so that the modifications can be applied. Use this method when no solution data exists, similar to the first run.

Case Modification
allows you to indicate how long you would like to run with the original settings, then make any modifications to the case settings.

Defined Modifications
indicates the number of modifications for the case file.

Active
allows you to enable or disable a defined case modification.

Name
represents the name of the case modification.

Commands
represents an area where you can input text commands.

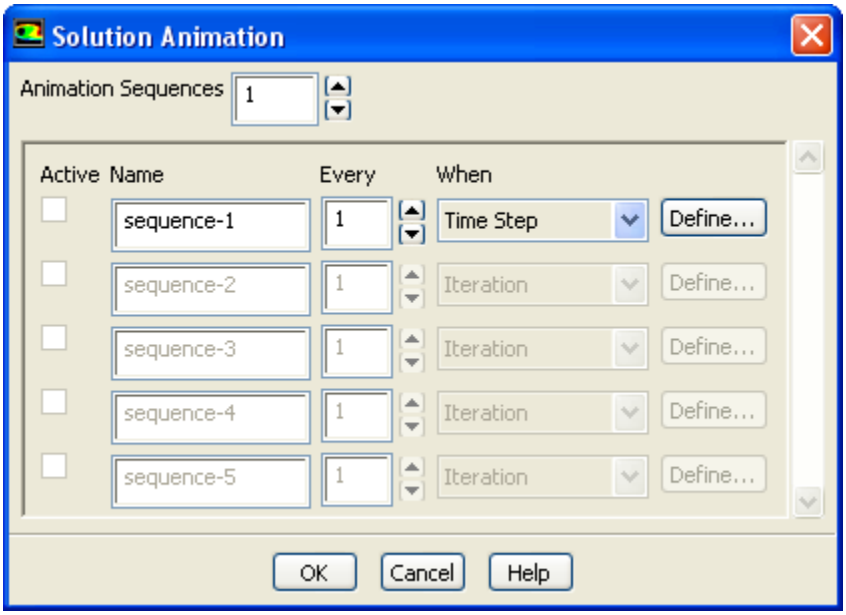
Number of Iterations/Time Steps
represents the number of iterations or time steps that you want to run define ed case modification commands.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Define Macro...
opens the *Define Macro Dialog Box* (p. 1951), in which you can define command macros.

35.16.8. Solution Animation Dialog Box

You can use the **Solution Animation** dialog box to create an animation sequence and indicate how often each frame of the sequence should be created. See *Defining an Animation Sequence* (p. 1296) for details about the items below.



Controls

Animation Sequences
sets the total number of animation sequences to be defined.

Active
activates/deactivates each animation sequence.

Name
specifies a name for each animation sequence.

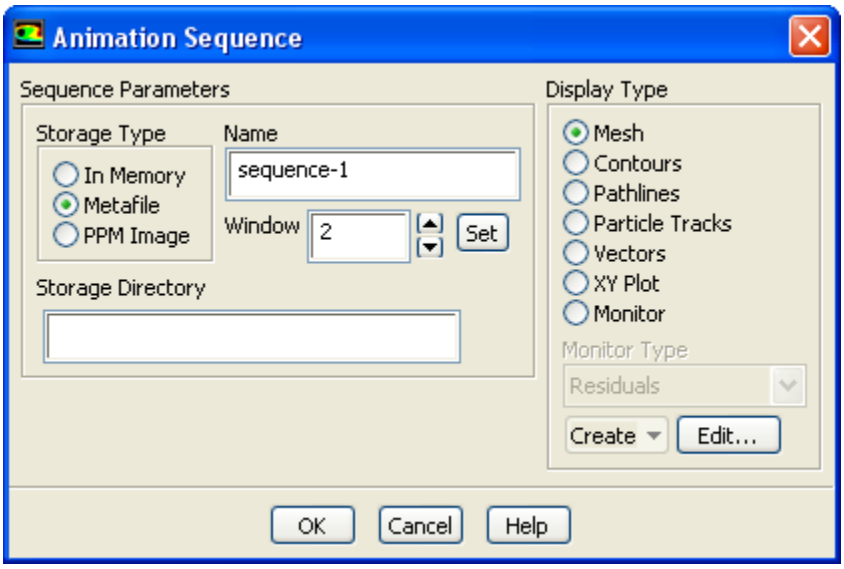
Every, When
indicate how often you want to create a new frame in the animation sequence. You can enter the interval under **Every** and select **Iteration** or **Time Step** in the drop-down list below **When**. (**Time Step** is a valid choice only if you are calculating unsteady flow.)

Define...
opens the *Animation Sequence Dialog Box* (p. 1953), in which you can define an animation sequence.

35.16.9. Animation Sequence Dialog Box

The **Animation Sequence** dialog box allows you to define each animation sequence. See *Defining an Animation Sequence* (p. 1296) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Sequence Parameters

contains general parameters for the storage and display location of the animation sequence.

Storage Type

specifies whether you want ANSYS FLUENT to save the animation sequence frames in memory (**In Memory**) or on your computer's hard drive (**Metafile** or **PPM Image**).

Name

specifies the name of the sequence.

Window

specifies the ID of the graphics window where you want the plot to be displayed. You must click **Set** to set the specified **Window**.

When ANSYS FLUENT is iterating, the active graphics window is set to this window to update the plot. If you want to maintain each animation in a separate window, specify a different **Window** ID for each.

Set

sets the specified **Window** to be the window where the plot will be displayed. (The specified window will open, if it is not already open.)

Storage Directory

specifies the directory where you want to store the files. (This can be a relative or absolute path.)

Display Type

specifies the type of display to be animated.

Mesh

opens the *Mesh Display Dialog Box* (p. 1635) where you can select a mesh display.

Contours

opens the *Contours Dialog Box* (p. 1967) where you can select a contour display.

Pathlines

opens the *Pathlines Dialog Box* (p. 1975) where you can select pathlines to display.

Particle Tracks

opens the *Particle Tracks Dialog Box* (p. 1980) where you can select particle tracks to display.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Vectors
opens the *Vectors Dialog Box* (p. 1970) where you can select a vector display.

XY Plot
opens the *Solution XY Plot Dialog Box* (p. 2012) where you can select a solution XY plot.

Monitor
selects a monitor plot.

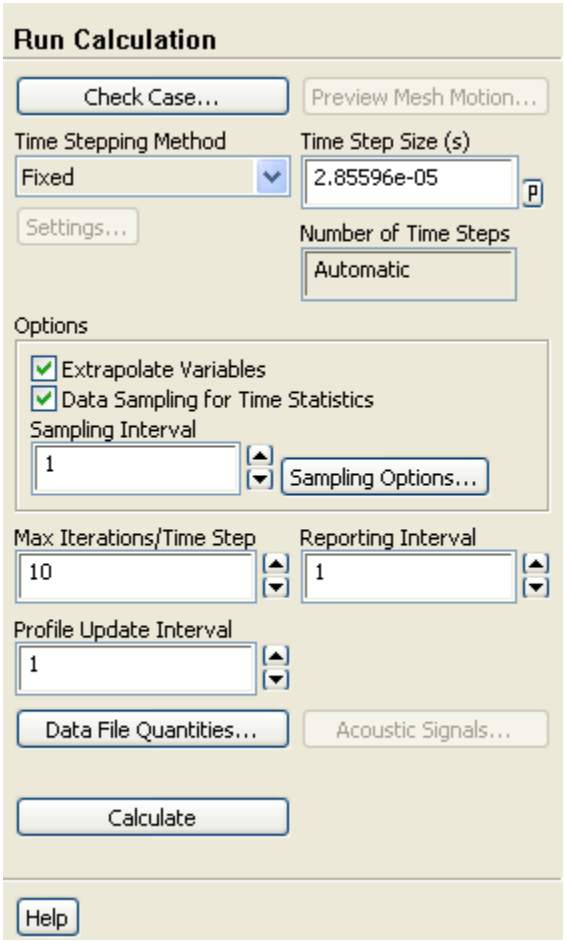
Monitor Type
contains a drop-down list of the available types of monitor plots (**Residuals**, **Drag**, **Lift**, **Moment**,and **Statistics**).

Create
provides a drop-down list that contains options for creating surface monitors or volume monitors.

Edit...
opens the dialog box that corresponds to the selected display or monitor type (e.g., the **Contours** dialog box if you have selected **Contours**).

35.17. Run Calculation Task Page

The **Run Calculation** task page allows you to start the solver iterations. See *Performing Steady-State Calculations* (p. 1247) and *Performing Time-Dependent Calculations* (p. 1255) for details about the items below.



Controls

Check Case...
opens the *Case Check Dialog Box* (p. 1959).

Preview Mesh Motion...
opens the *Mesh Motion Dialog Box* (p. 1896).

Pseudo Transient Options
is available for fluid and solid zones and will only appear for steady-state cases, where the pressure-based coupled solver is used. Note that the **Pseudo Transient** option must be enabled in the *Solution Methods Task Page* (p. 1900). For details about the available options, see *Performing Pseudo Transient Calculations* (p. 1249).

Number of Iterations
(for steady flow calculations) sets the number of iterations to be performed. (For unsteady calculations using the explicit unsteady formulation, this will specify the number of time steps, since each iteration will be a time step.)

Time Stepping Method
(for transient flow calculations) contains options for how the time step is determined.

Fixed
selects a fixed time step, equal to the specified **Time Step Size**.

Adaptive
selects a time step that is initially equal to the specified **Time Step Size**, but gets modified by ANSYS FLUENT as the calculation proceeds. See *Adaptive Time Stepping* (p. 1264) for details.

Variable
enables variable time stepping method. The inputs are same as for the adaptive time stepping method, with the exception of specifying a global Courant number. **Variable** is selectable when the VOF multiphase model is enabled. See *Variable Time Stepping* (p. 1266) for details.

Settings...
opens either the *Adaptive Time Step Settings Dialog Box* (p. 1960) when **Adaptive** is selected as the **Time Stepping Method**, or the *Variable Time Step Settings Dialog Box* (p. 1962) when **Variable** is selected as the **Time Stepping Method**.

Time Step Size(s)
(for transient flow calculations) sets the magnitude of the (physical) time step Δt.

This quantity can be assigned to an input parameter (indicated by the small "p" icon next to the field). Clicking this icon displays the *Select Input Parameter Dialog Box* (p. 1807) where you can create and assign input parameters.

Time Step Size for Acoustic Data Export
determines the highest frequency that the acoustic analysis reproduces. This is available when the FW-H acoustics model is enabled.

Number of Time Steps
(for transient flow calculations) sets the number of time steps to be performed.

Options
contains options related to unsteady calculations.

Extrapolate Variables
instructs ANSYS FLUENT to predict the solution variable values for the next time step and then input that predicted value as an initial guess for the inner iterations of the current time step.

Data Sampling for Time Statistics
enables the sampling of data during an unsteady calculation. See *User Inputs for Time-Dependent Problems* (p. 1256) and *Postprocessing for Time-Dependent Problems* (p. 1267) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Sampling Interval
allows you to specify the frequency of the **Data Sampling for Time Statistics**.

Sampling Options...
opens the *Sampling Options Dialog Box* (p. 1963) for the **Data Sampling forTime Statistics**.

Max Iterations/Time Step
for unsteady flow calculations using an implicit unsteady formulation) sets the maximum number of iterations to be performed per time step. If the convergence criteria are met before this number of iterations is performed, the solution will advance to the next time step. See *User Inputs for Time-Dependent Problems* (p. 1256) for details.

Reporting Interval
sets the number of iterations that will pass before convergence monitors will be printed and plotted. The default is 1 (i.e., reports will be updated after each iteration).

Postprocess Pollutants
results in the automatic postprocessing of pollutants during a transient simulation. This option is available when one of the pollution models is enabled.

Max Post Iterations/Time Step
sets the maximum number of postprocessing iterations to be performed per time step. This field is available when the **Postprocess Pollutants** option is enabled.

Profile Update Interval
sets the number of iterations that will pass before user-defined functions for boundary profiles, properties, etc. will be updated.

Solution Steering
allows you to set parameters that will help ANSYS FLUENT guide the calculations to a converged solution (available only for steady-state flows in the density-based implicit solver). See *Solution Steering* (p. 1320) for more information. When enabled, the following options are available:

Flow Type
allows you to select the flow type that best describes the flow in the solution domain. Five choices are available: **incompressible**, **subsonic**, **transonic**, **supersonic**, and **hypersonic**.

Use FMG Initialization
allows for full multigrid initialization.

First to Higher Order Blending
allows you to reduce the desired solution accuracy by selecting a blending factor less than 100%. The default setting is 100%. See First-to-Higher Order Blending in the Theory Guide for more information. The blending factor will be grayed out if **Second Order Upwind** discretization for the **Flow** equations is not selected in the **Solution Methods** task page. The solution accuracy may be reduced (typical values are 75% or 50%) if it is not possible to obtain a converged solution with the maximum second-order accuracy (i.e. blending = 100%)

More Settings...
opens the *Solution Steering Dialog Box* (p. 1958).

Courant Number
is a non-adjustable field displaying the current CFL number, which allows you to view it during the calculation.

Data File Quantities...
opens the *Data File Quantities Dialog Box* (p. 1945).

Acoustic Signals...
opens the *Acoustic Signals Dialog Box* (p. 1963). This button is only available when the acoustics model is enabled.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Calculate

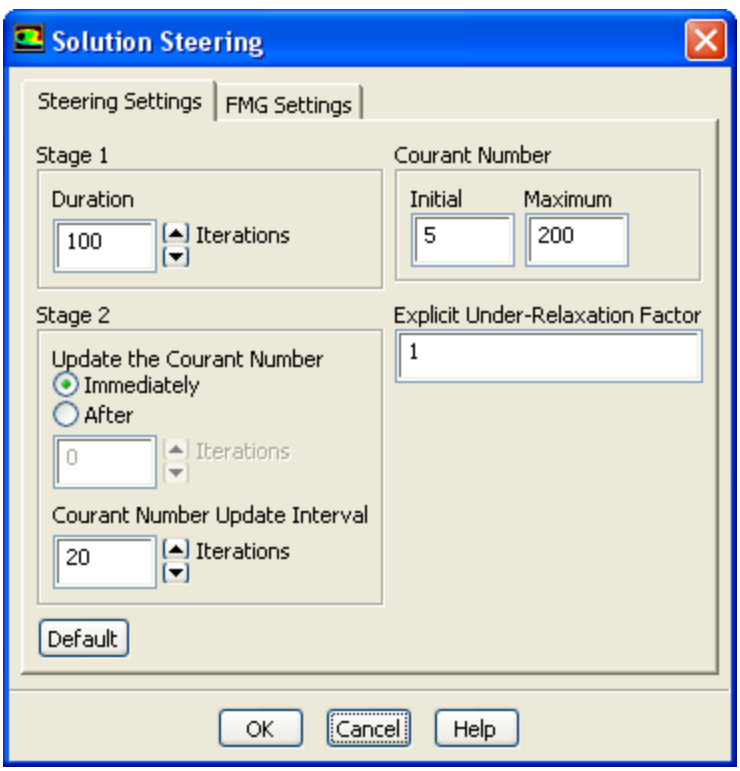
starts the calculations. While the calculation is in progress, a **Working** dialog box will appear. Clicking the **Cancel** button or typing `<Control-C>` in the console window will interrupt the calculation (as soon as it is safe to stop).

For additional information, please see the following sections:

35.17.1. Solution Steering Dialog Box
35.17.2. Case Check Dialog Box
35.17.3. Adaptive Time Step Settings Dialog Box
35.17.4. Variable Time Step Settings Dialog Box
35.17.5. Sampling Options Dialog Box
35.17.6. Acoustic Signals Dialog Box

35.17.1. Solution Steering Dialog Box

The **Solution Steering** dialog box is used to set the parameters that control the solution steering strategy. Solution steering will typically perform full multigrid (FMG) initialization followed by two iterative stages (Stage 1 and Stage 2). The purpose of Stage 1 is to navigate the solution from the difficult initial phase of the solution toward convergence by insuring maximum stability. During this stage, the solution is advanced gradually from 1st-order accuracy to maximum accuracy (user specified and typically 2nd-order) at a constant low CFL value. In Stage 2, the solution is driven hard towards convergence by regular adjustments of the CFL value to insure fast convergence as well as to prevent possible divergence. In Stage 2, the residual history is monitored and analyzed through regular intervals to determine if an increase or decrease in CFL value is needed to obtain fast convergence or to prevent divergence. See *Solution Steering* (p. 1320) for details.



Controls

Steering Settings

allows you to modify the steering parameters used in Stages 1 and 2.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Stage 1
allows you to set parameters relating to stage 1.

Duration
is the number of iterations in stage 1. The CFL number used during these iterations is set in the **Initial** field, in the **Courant Number** group box.

Stage 2
allows you to set parameters relating to stage 2.

Update the Courant Number
allows you to update the Courant number either **Immediately**, or **After** a specified number of iterations.

Courant Number Update Interval
defines the frequency at which the Courant number is updated.

Courant Number
allows you to set the starting (**Initial**) and maximum allowed (**Maximum**) Courant number values. The solution steering algorithm will not allow the solver to exceed the maximum Courant number, but will allow the solver to use a Courant number less than the initial Courant number if divergence in the solution has occurred.

Explicit Under-Relaxation Factor
allows the solution to be under-relaxed to improve convergence.

Default
resets any changes made to the parameters to their original default values.

FMG Settings
allows you to set FMG parameters. For more information about FMG initialization, refer to *Full Multigrid (FMG) Initialization* (p. 1244).

Number of Multigrid Levels
allows you to set the number of multigrid levels.

Number of Cycles
allows you to set the number of cycles for a selected level.

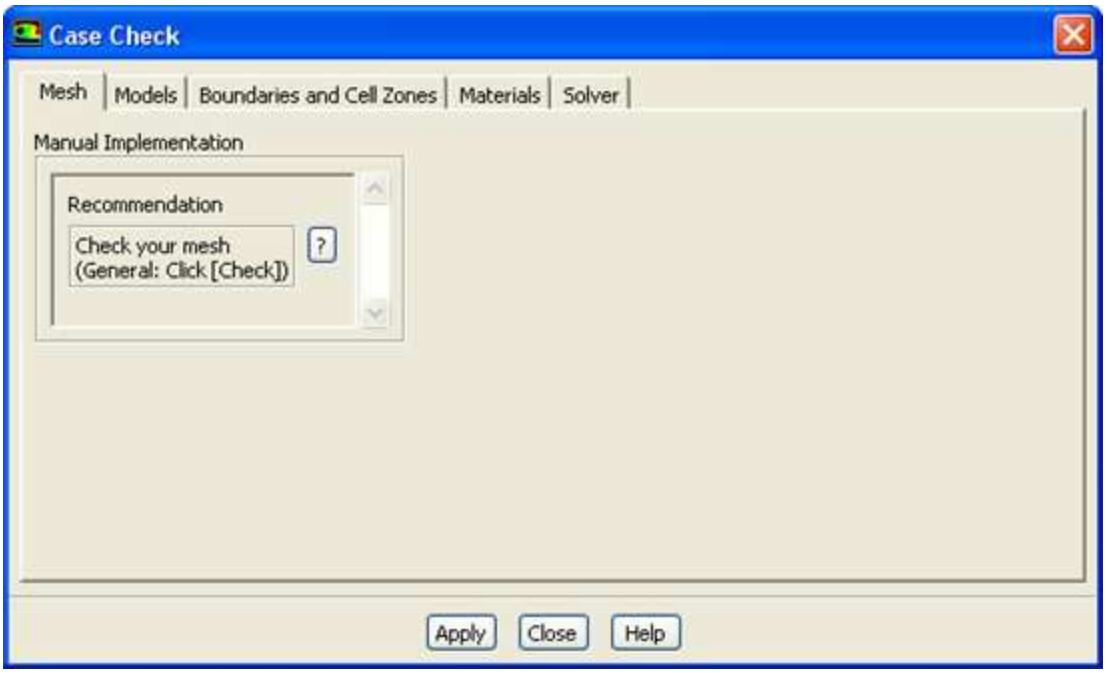
FMG Courant Number
allows you to set the FMG Courant number.

Default
resets any changes to the original default values.

35.17.2. Case Check Dialog Box

This function provides you with guidance and best practices when choosing case parameters and models. Your case will be checked for compliance in the mesh, models, boundary and cell zone conditions, material properties, and solver categories. Established rules are available for each category, with recommended changes to your current settings. Information about each of the recommendations is available in *Checking Your Case Setup* (p. 1304).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Mesh
displays recommendations, if any, relating the to the mesh used in the case. See *Checking the Mesh* (p. 1306) for details.

Models
displays recommendations, if any, relating the to the models used in the case. See *Checking Model Selections* (p. 1308) for details.

Boundaries and Cell Zones
displays recommendations, if any, relating the to the cell zones or boundaries defined in the case. See *Checking Boundary and Cell Zone Conditions* (p. 1310) for details.

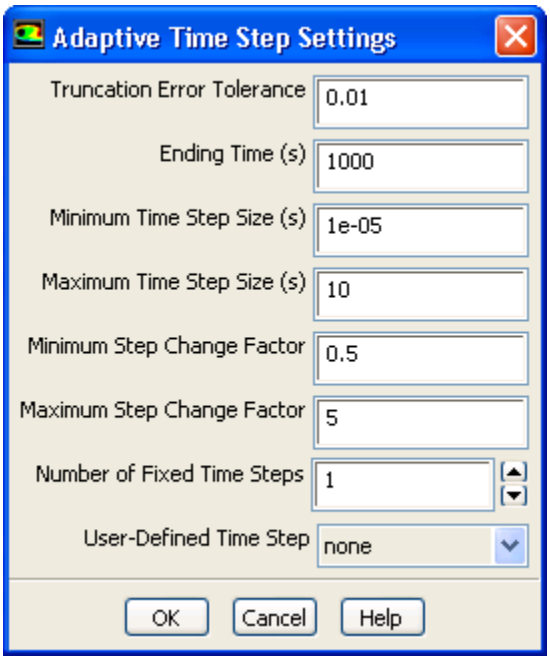
Materials
displays recommendations, if any, relating the to the materials defined in the case. See *Checking Material Properties* (p. 1313) for details.

Solver
displays recommendations, if any, relating the to the solver settings used in the case. See *Checking the Solver Settings* (p. 1314) for details.

35.17.3. Adaptive Time Step Settings Dialog Box

The **Adaptive Time Step Settings** dialog box is used to set the parameters that control the adaptive time stepping. See *Adaptive Time Stepping* (p. 1264) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Truncation Error Tolerance

specifies the threshold value to which the computed truncation error is compared. Increasing this value will lead to an increase in the size of the time step and a reduction in the accuracy of the solution. Decreasing it will lead to a reduction in the size of the time step and an increase in the solution accuracy, although the calculation will require more computational time. For most cases, the default value of 0.01 is acceptable.

Ending Time

specifies an ending time for the calculation. Since the ending time cannot be determined by multiplying the number of time steps by a fixed time step size, you need to specify it explicitly.

Minimum/Maximum Time Step Size

specify the upper and lower limits for the size of the time step. If the time step becomes very small, the computational expense may be too high; if the time step becomes very large, the solution accuracy may not be acceptable to you. You can set the limits that are appropriate for your simulation.

Minimum/Maximum Step Change Factor

limit the degree to which the time step size can change at each time step. Limiting the change results in a smoother calculation of the time step size, especially when high-frequency noise is present in the solution. If the time step change factor, f, is computed as the ratio between the specified truncation error tolerance and the computed truncation error, the size of time step Δt_n is computed as follows:

- If $1 < f < f_{max}$, Δt_n is increased to meet the required tolerance.
- If $1 < f_{max} < f$, Δt_n is increased, but its maximum possible value is $f_{max} \Delta t_{n-1}$.
- If $f_{min} < f < 1$, Δt_n is unchanged.
- If $f < f_{min} < 1$, Δt_n is decreased.

Number of Fixed Time Steps

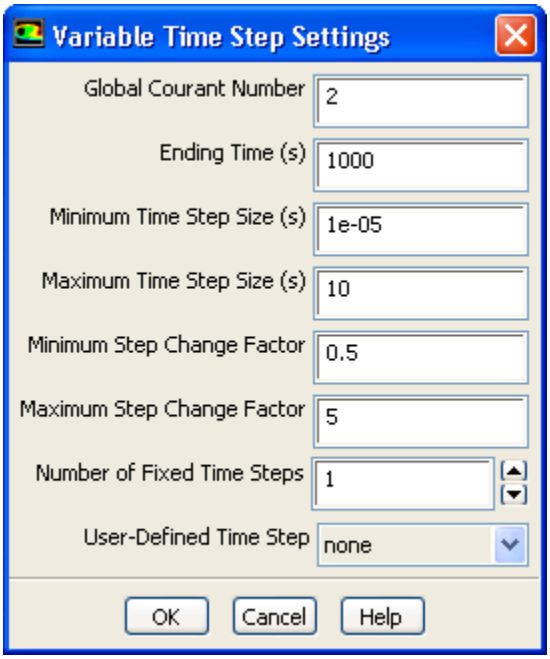
specifies the number of fixed-size time steps that should be performed before the size of the time step starts to change. The size of the fixed time step is the value specified for **Time Step Size** under **Time**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

User-Defined Time Step
contains a drop-down list of available user-defined functions.

35.17.4. Variable Time Step Settings Dialog Box

The **Variable Time Step Settings** dialog box contains parameters related to variable time stepping. See *Variable Time Stepping* (p. 1266) for details.



Controls

Global Courant Number
allows you to specify the Courant number. The default value for the **Global Courant number** is 2.

Ending Time
specifies an ending time for the calculation. Since the ending time cannot be determined by multiplying the number of time steps by a fixed time step size, you need to specify it explicitly.

Minimum/Maximum Time Step Size
specify the upper and lower limits for the size of the time step. If the time step becomes very small, the computational expense may be too high; if the time step becomes very large, the solution accuracy may not be acceptable to you. You can set the limits that are appropriate for your simulation.

Minimum/Maximum Step Change Factor
limit the degree to which the time step size can change at each time step. Limiting the change results in a smoother calculation of the time step size, especially when high-frequency noise is present in the solution. If the time step change factor, f, is computed as the ratio between the specified truncation error tolerance and the computed truncation error, the size of time step Δt_n is computed as follows:

- If $1 < f < f_{max}$, Δt_n is increased to meet the required tolerance.
- If $1 < f_{max} < f$, Δt_n is increased, but its maximum possible value is $f_{max} \Delta t_{n-1}$.
- If $f_{min} < f < 1$, Δt_n is unchanged.
- If $f < f_{min} < 1$, Δt_n is decreased.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of Fixed Time Steps

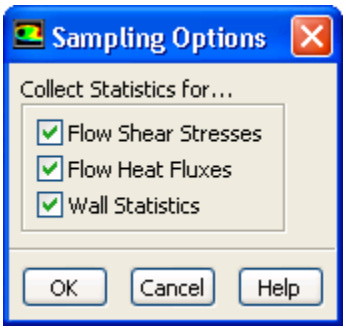
specifies the number of fixed-size time steps that should be performed before the size of the time step starts to change. The size of the fixed time step is the value specified for **Time Step Size** under **Time**.

User-Defined Time Step

contains a drop-down list of available user-defined functions.

35.17.5. Sampling Options Dialog Box

The **Sampling Options** dialog box allows you to specify a collection of statistics for: **Flow Shear Stresses**, **Flow Heat Fluxes**, or **Wall Statistics**.



Controls

Flow Shear Stresses

allows you to enable or disable the flow shear stress statistics used in postprocessing.

Flow Heat Fluxes

allows you to enable or disable the flow heat fluxes statistics used in postprocessing.

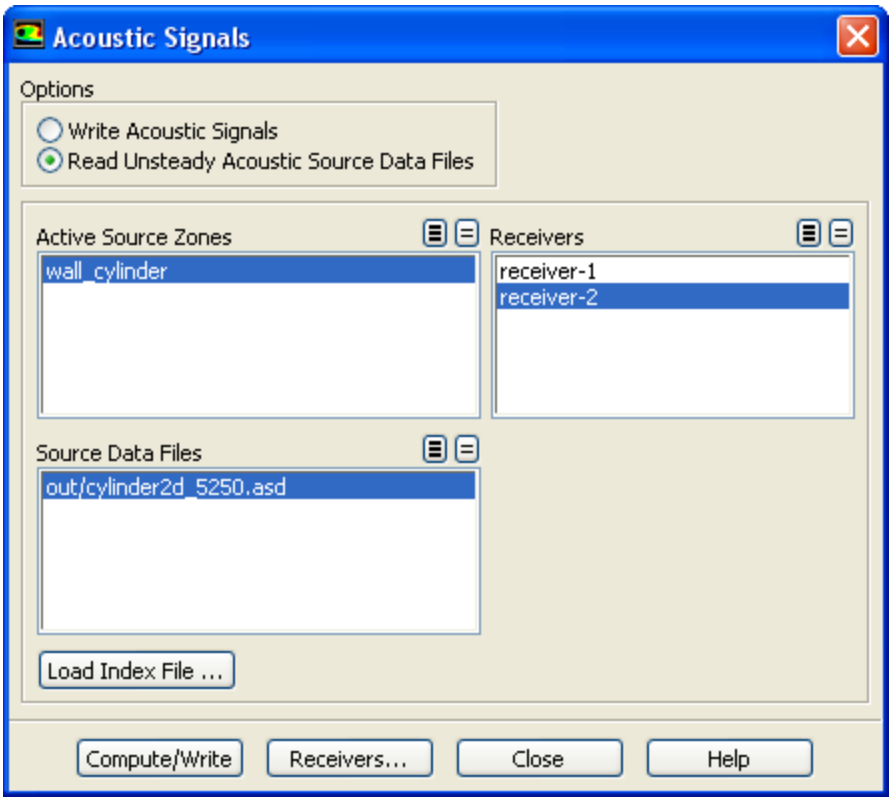
Wall Statistics

allows you to enable or disable the wall statistics used in postprocessing.

35.17.6. Acoustic Signals Dialog Box

The **Acoustic Signals** dialog box is used to compute and save the sound pressure signals. See *Postprocessing the FW-H Acoustics Model Data* (p. 1000) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains the options available for acoustic signal postprocessing.

Write Acoustic Signals

enables the parameters needed to write the sound pressure data to files.

Read Unsteady Acoustic Source Data Files

enables the parameters needed to compute the sound pressure signals using the source data saved to files.

Active Source Zones

contains source zones you want to include to compute sound. See *Specifying Source Surfaces* (p. 995) for details.

Receivers

contains all the receivers for which you can compute sound.

Source Data Files

contains all the source data files that you can use to compute sound.

Load Index File...

opens the **Select File** dialog box, in which you can select the index file for your computation.

Write

writes the sound pressure data. This button will appear only when **Write Acoustic Signals** is selected under **Options**.

Compute/Write

computes and saves the sound pressure data. This button will appear only when **Read Unsteady Acoustic Source Data Files** is selected under **Options**.

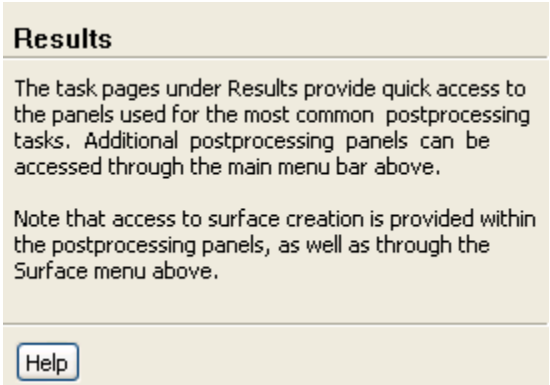
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Receivers...

opens the *Acoustic Receivers Dialog Box* (p. 1734) in which you can define additional receivers.

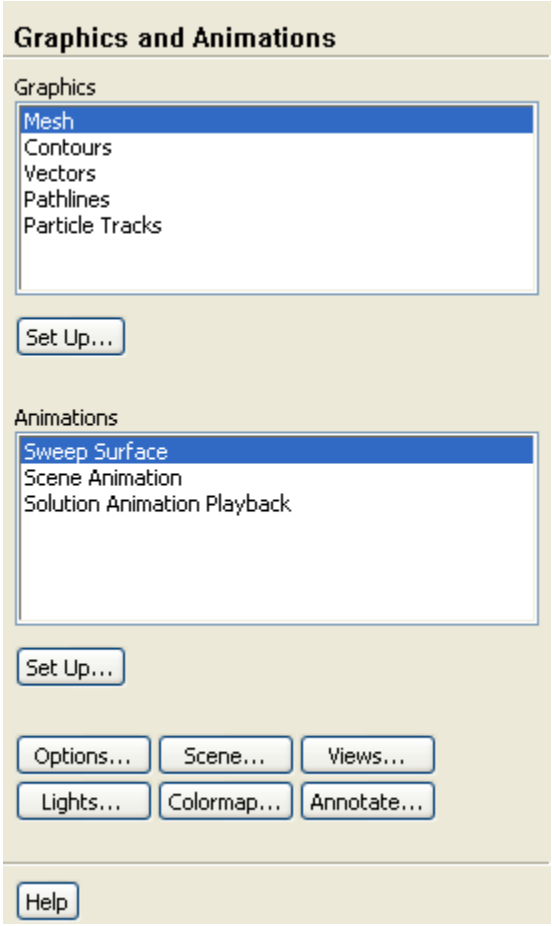
35.18. Results Task Page

The **Results** task page introduces you to the main tasks involved in setting up and displaying the results of your CFD simulation using ANSYS FLUENT.



35.19. Graphics and Animations Task Page

The **Graphics and Animation** task page allows you to visualize the results of your CFD simulation by allowing you to set up plots of contours, vectors, pathlines, particle tracks, scene descriptions and animations. See *Displaying Graphics* (p. 1379) for more information.



Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Graphics
displays a list of the available graphics objects.

You can double-click an item in the **Graphics** list to open the corresponding dialog box, or you can select the item in the list and click the **Set Up...** button.

Mesh
- selecting this item and clicking the **Set Up...** button opens the *Mesh Display Dialog Box* (p. 1635).

Contours
- selecting this item and clicking the **Set Up...** button opens the *Contours Dialog Box* (p. 1967).

Vectors
- selecting this item and clicking the **Set Up...** button opens the *Vectors Dialog Box* (p. 1970).

Pathlines
- selecting this item and clicking the **Set Up...** button opens the *Pathlines Dialog Box* (p. 1975).

Particle Tracks
- selecting this item and clicking the **Set Up...** button opens the *Particle Tracks Dialog Box* (p. 1980).

Set Up...
opens the dialog box corresponding to the selected object in the **Graphics** list.

Animations
displays a list of the available animation objects.

You can double-click an item in the **Animations** list to open the corresponding dialog box, or you can select the item in the list and click the **Set Up...** button.

Sweep Surface
- selecting this item and clicking the **Set Up...** button opens the *Sweep Surface Dialog Box* (p. 1984).

Scene Animation
- selecting this item and clicking the **Set Up...** button opens the *Animate Dialog Box* (p. 1986).

Solution Animation
- selecting this item and clicking the **Set Up...** button opens the *Playback Dialog Box* (p. 1990).

Set Up...
opens the dialog box corresponding to the selected object in the **Animations** list.

Options...
opens the *Display Options Dialog Box* (p. 1992).

Scene...
opens the *Scene Description Dialog Box* (p. 1994).

Views...
opens the *Views Dialog Box* (p. 2000).

Lights...
opens the *Lights Dialog Box* (p. 2005).

Colormap...
opens the *Colormap Dialog Box* (p. 2007).

Annotate...
opens the *Annotate Dialog Box* (p. 2010).

For additional information, please see the following sections:

35.19.1. Contours Dialog Box

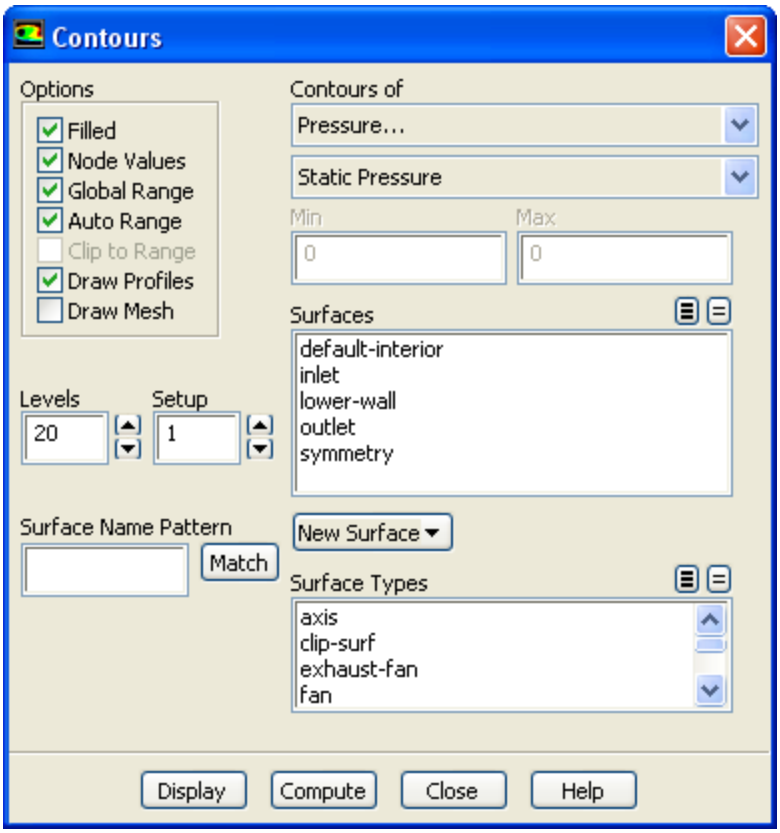
The **Contours** dialog box controls the display of contour and profile plots. See *Displaying Contours and Profiles* (p. 1386) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains the check buttons that set various contour display options.

Filled

toggles between filled contours and line contours.

Node Values

toggles between using scalar field values at nodes and at cell centers for computing the contours. When the **Filled** option is off, **Node Values** is always on. See *Choosing Node or Cell Values* (p. 1392) for details.

Global Range

toggles between basing the minimum and maximum values on the range of values on the selected surfaces (off), and basing them on the range of values in the entire domain (on, the default).

Auto Range

toggles between automatic and manual setting of the contour range. Any time you change the **Contours of** selection, **Auto Range** is reset to on.

Clip to Range

determines whether or not values outside the prescribed **Min**/ **Max** range are contoured when using **Filled** contours. If selected, values outside the range will not be contoured. If not selected, values below the **Min** value will be colored with the lowest color on the color scale, and values above the **Max** value will be colored with the highest color on the color scale. See *Specifying the Range of Magnitudes Displayed* (p. 1390) for details.

Draw Profiles

causes the addition of a profile plot to the contour plot. The *Profile Options Dialog Box* (p. 1970) is opened when **Draw Profiles** is selected.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Draw Mesh
toggles between displaying and not displaying the mesh. The *Mesh Display Dialog Box* (p. 1635) is opened when **Draw Mesh** is selected.

Levels
sets the number of contour levels that are displayed.

Setup
indicates the ID number of the contour setup. For frequently used combinations of contour fields and options, you can store the information needed to generate the contour plot by specifying a **Setup** number and setting up the desired information in the **Contours** dialog box. See *Storing Contour Plot Settings* (p. 1393) for details.

Surface Name Pattern
specifies the pattern to look for in the names of surfaces. Type the pattern in the text field and click **Match** to select (or deselect) the zones in the **Surfaces** list with names that match the specified pattern. See *Generating Contour and Profile Plots* (p. 1387) for information about matching additional characters using * and ?.

Contours of
contains a list from which you can select the scalar field to be contoured.

Min
shows the minimum value of the scalar field. If **Auto Range** is off, you can set the minimum by typing a new value.

Max
shows the maximum value of the scalar field. If **Auto Range** is off, you can set the maximum by typing a new value.

Surfaces
contains a list from which you can select the surfaces on which to draw contours. For 2D cases, if no surface is selected, contouring is done on the entire domain. For 3D cases, you must always select at least one surface.

New Surface
is a drop-down list button that contains a list of surface options:

Point
opens the *Point Surface Dialog Box* (p. 1927).

Line/Rake
opens the *Line/Rake Surface Dialog Box* (p. 1928).

Plane
opens the *Plane Surface Dialog Box* (p. 1929).

Quadric
opens the *Quadric Surface Dialog Box* (p. 1931).

Iso-Surface
opens the *Iso-Surface Dialog Box* (p. 1933).

Iso-Clip
opens the *Iso-Clip Dialog Box* (p. 1935).

Surface Types
contains a selectable list of types of surfaces. If you select (or deselect) an item in this list, all surfaces of that type will be selected (or deselected) automatically in the **Surfaces** list.

Display
draws the contours in the active graphics window.

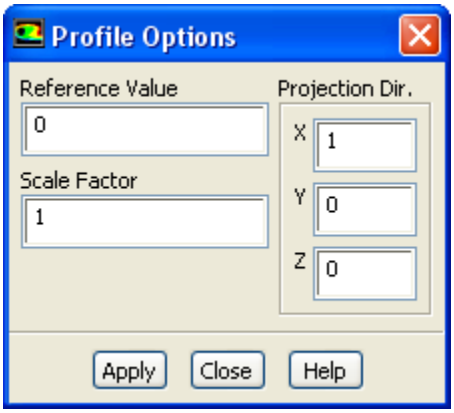
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Compute

calculates the scalar field and updates the **Min** and **Max** values (even when **Auto Range** is off).

35.19.2. Profile Options Dialog Box

The **Profile Options** dialog box controls the scaling and projection direction of profiles. It is opened from the *Contours Dialog Box* (p. 1967), and you will display the profiles using the **Display** button in that dialog box. See *Displaying Contours and Profiles* (p. 1386) for details about the items below.



Controls

Reference Value

sets the "zero height" reference value for the profile. Any point on the profile with a value equal to the **Reference Value** will be plotted exactly on the defining surface. Values greater than the **Reference Value** will be projected ahead of the surface (in the direction of **Projection Dir.** and scaled by **Scale Factor**), and values less than the **Reference Value** will be projected behind the surface.

Scale Factor

sets the length scale factor for projection. After subtracting off the **Reference Value**, ANSYS FLUENT multiplies the resulting solution value by the **Scale Factor** to form a length.

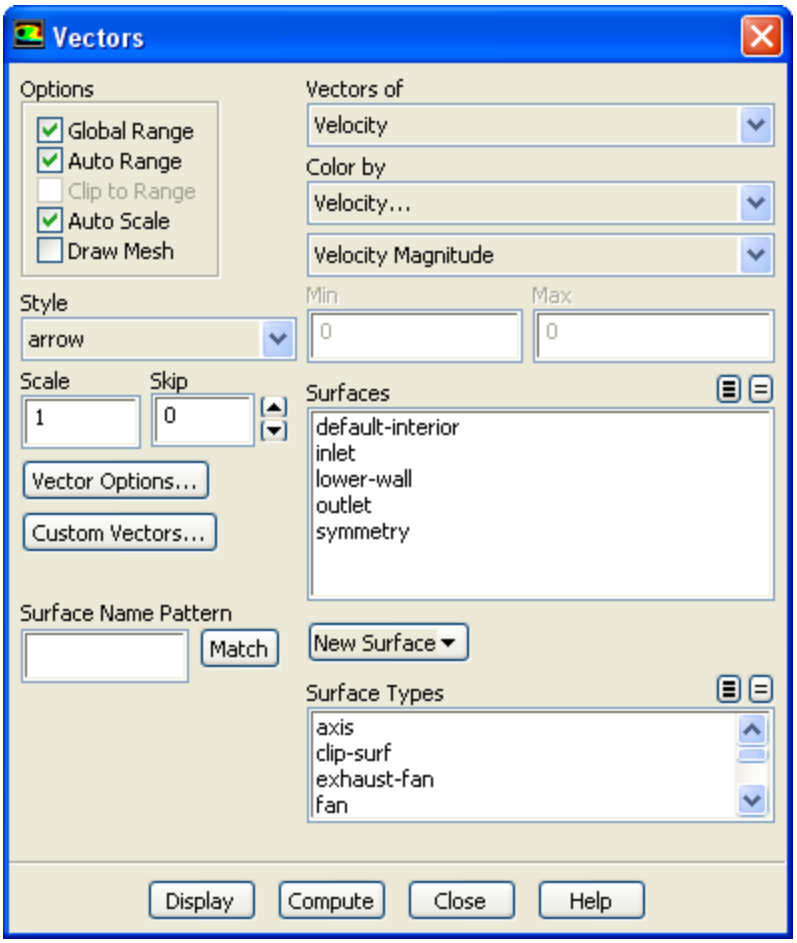
Projection Dir.

sets the direction in which profiles are projected. In 2D, for example, a contour plot of pressure on the entire domain can be projected in the z direction to form a carpet plot, or a contour plot of x velocity on a sequence of x-coordinate slice lines can be projected in the x direction to form a series of velocity profiles.

35.19.3. Vectors Dialog Box

The **Vectors** dialog box controls the display of vector plots. See *Displaying Vectors* (p. 1393) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains check buttons that set various display options.

Global Range

toggles between basing the minimum and maximum values on the range of values on the selected surfaces (off), and basing them on the range of values in the entire domain (on, the default).

Auto Range

toggles between automatic and manual setting of the range of scalar field values.

Clip to Range

controls the display of vectors that have a value outside the range specified by **Min** and **Max**. When on, no vectors are displayed outside the range. When off, vectors are displayed outside the range using the colors at the top and bottom of the color scale. This option is applicable only when **Auto Range** is off. See *Specifying the Range of Magnitudes Displayed* (p. 1397) for details.

Auto Scale

enables the scaling of all vectors in the domain such that when the **Scale** is 1, there will be minimal overlap of vectors.

Draw Mesh

toggles between displaying and not displaying the mesh. The *Mesh Display Dialog Box* (p. 1635) is opened when **Draw Mesh** is selected.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Style
selects the style in which the vectors are drawn. Available styles are **cone**, **filled-arrow**, **arrow**, **harpoon**, and **headless**.

Scale
sets the factor by which the vectors should be scaled. See *Scaling the Vectors* (p. 1395) for details.

Skip
allows you to "thin" or "sample" the vectors that are displayed. See *Skipping Vectors* (p. 1396) for details.

Vector Options...
opens the *Vector Options Dialog Box* (p. 1973), in which you can set additional options for vector displays.

Custom Vectors...
opens the *Custom Vectors Dialog Box* (p. 1973), in which you can define your own vector fields.

Surface Name Pattern
specifies the pattern to look for in the names of surfaces. Type the pattern in the text field and click **Match** to select (or deselect) the zones in the **Surfaces** list with names that match the specified pattern. See *Generating Vector Plots* (p. 1394) for information about matching additional characters using * and ?.

Vectors of
contains a list from which you can select the vector field to be plotted.

Color by
contains a list from which you can select the scalar field by which the vectors are colored.

Min
shows the value to which the lower end of the color scale is mapped. You can set this value manually if **Auto Range** is off.

Max
shows the value to which the upper end of the color scale is mapped. You can set this value manually if **Auto Range** is off.

Surfaces
contains a list from which you can select the surfaces on which to display vectors. In 2D, vectors are displayed on the entire domain if no surface is selected.

New Surface
is a drop-down list button that contains a list of surface options:

Point
opens the *Point Surface Dialog Box* (p. 1927).

Line/Rake
opens the *Line/Rake Surface Dialog Box* (p. 1928).

Plane
opens the *Plane Surface Dialog Box* (p. 1929).

Quadric
opens the *Quadric Surface Dialog Box* (p. 1931).

Iso-Surface
opens the *Iso-Surface Dialog Box* (p. 1933).

Iso-Clip
opens the *Iso-Clip Dialog Box* (p. 1935).

Surface Types
contains a selectable list of types of surfaces. If you select (or deselect) an item in this list, all surfaces of that type will be selected (or deselected) automatically in the **Surfaces** list.

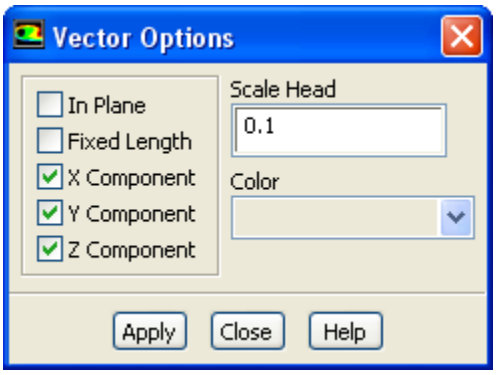
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Display
draws the vectors in the active graphics window.

Compute
calculates the scalar field and updates the **Min** and **Max** values (even when **Auto Range** is off).

35.19.4. Vector Options Dialog Box

The **Vector Options** dialog box allows you to set additional parameters for vector displays. It is opened from the *Vectors Dialog Box* (p. 1970). See *Vector Plot Options* (p. 1395) for details about the items below.



Controls

In Plane
toggles the display of vector components in the plane of the surface selected for display. This feature is useful for visualizing components that are normal to the flow. See *Drawing Vectors in the Plane of the Surface* (p. 1396) for details.

Fixed Length
enables the display of vectors that are all the same length. See *Displaying Fixed-Length Vectors* (p. 1397) for details.

X, Y, Z Component
toggle the display of the Cartesian components of the vectors. See *Displaying Vector Components* (p. 1397) for details.

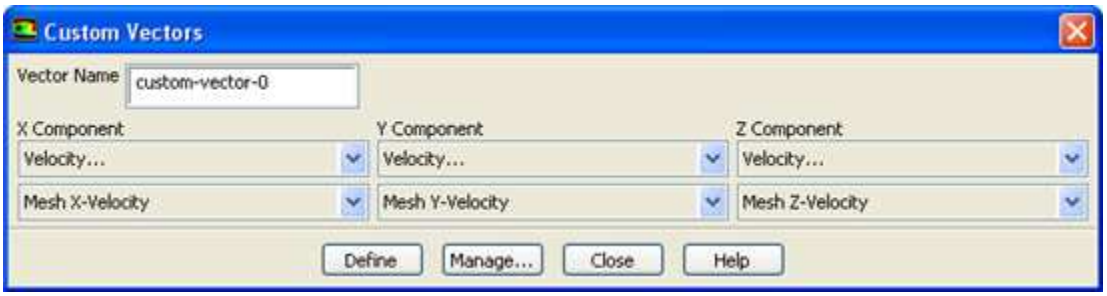
Scale Head
controls the size of the arrowhead on vector styles that include heads.

Color
specifies a single color for the display of all vectors. See *Displaying Vectors Using a Single Color* (p. 1398) for details.

35.19.5. Custom Vectors Dialog Box

The **Custom Vectors** dialog box allows you to define custom vectors based on existing quantities. Any vectors that you define will be added to the **Vectors of** list in the *Vectors Dialog Box* (p. 1970). To open the **Custom Vectors** dialog box, click **Custom Vectors...** in the **Vectors** dialog box. See *Creating and Managing Custom Vectors* (p. 1398) for details about custom vectors.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Vector Name

specifies the name of the vector you are defining. Should you decide to change the name after you have defined the vector, you can do so in the *Vector Definitions Dialog Box* (p. 1974), which you can open by clicking on the **Manage...** button.

X, Y, Z Component

specify the x, y, and z components of the vector. Each drop-down list contains the available field functions.

Define

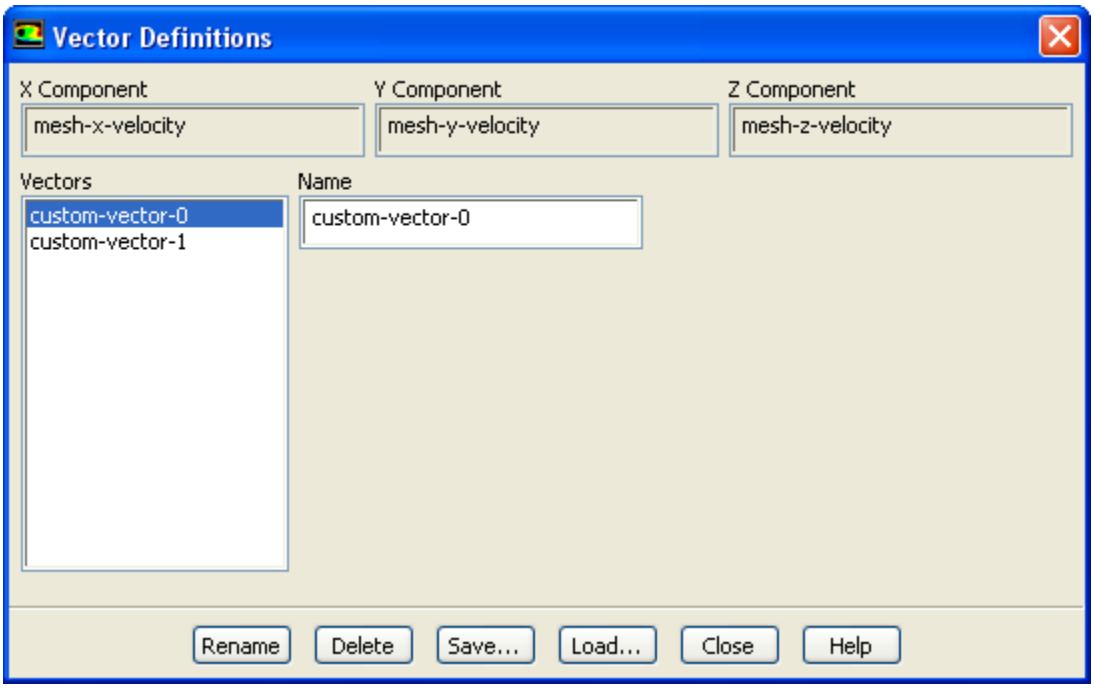
creates the vector and adds it to the **Vectors of** list in the *Vectors Dialog Box* (p. 1970).

Manage...

opens the *Vector Definitions Dialog Box* (p. 1974), which enables you to check, rename, save, load, and delete custom vectors.

35.19.6. Vector Definitions Dialog Box

The **Vector Definitions** dialog box allows you to check, rename, save, load, and delete custom vectors that you defined in the *Custom Vectors Dialog Box* (p. 1973). See *Creating and Managing Custom Vectors* (p. 1398) for details about the items below.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X, Y, Z Component

display the x, y, and z components of the vector.

Vectors

contains a selectable list of custom vectors. When you select a vector, its components will appear in the **X**, **Y**, and **Z Component** fields, and its name will appear in the **Name** field.

Name

displays the name of the currently selected vector. You can enter a new name in this box if you want to rename the vector.

Rename

changes the name of the selected function to the name specified in the **Name** field.

Delete

deletes the selected vector.

Save...

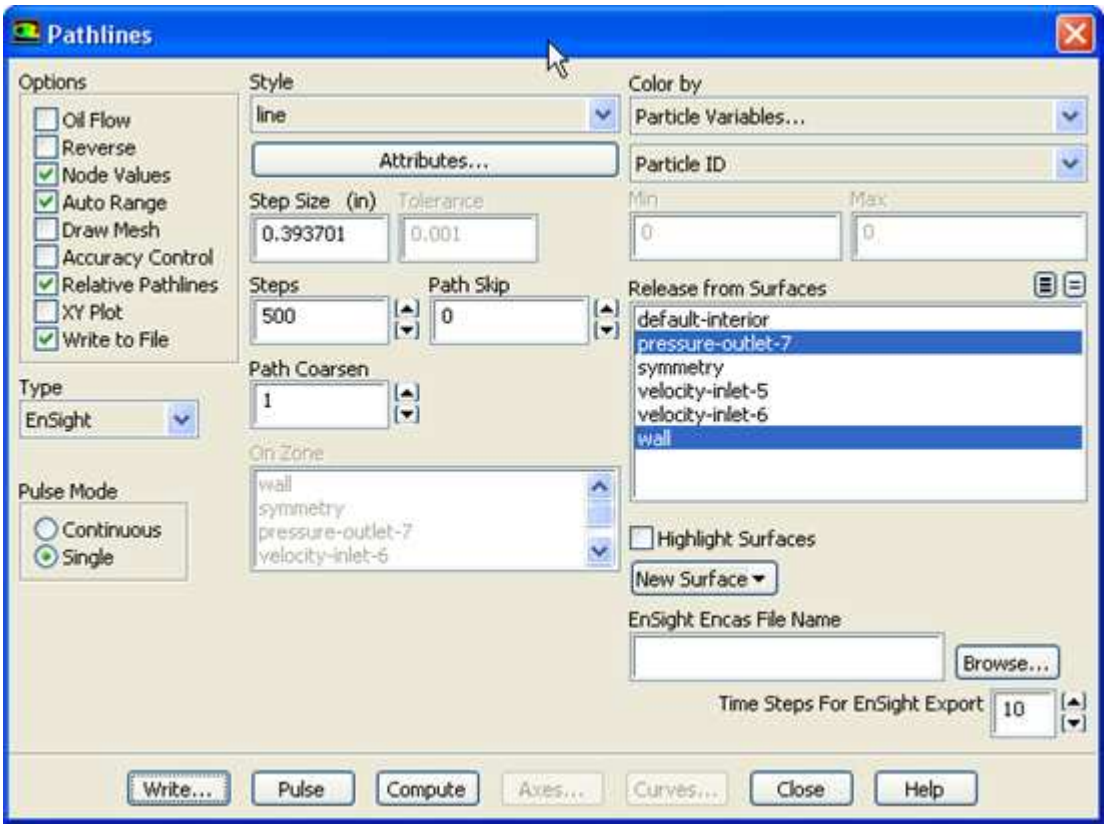
opens *The **Select File** Dialog Box* (p. 33), in which you can specify a file in which to save all of the custom vectors in the **Vectors** list.

Load...

opens the **Select File** dialog box, in which you can specify a file from which to read custom vectors (i.e., a file that you saved using the **Save...** button above).

35.19.7. Pathlines Dialog Box

The **Pathlines** dialog box controls the generation and display of pathlines. See *Displaying Pathlines* (p. 1400) for details about the items below.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

contains the options described below:

Oil Flow

toggles between regular pathlines and oil-flow pathlines. When this option is selected, pathlines are constrained to lie on the zone selected in the **On Zone** list.

Reverse

specifies that each particle's path is traced back in time. This option is turned off by default.

Node Values

specifies that node values should be interpolated to compute the scalar field at a particle location. This option is turned on by default. See *Choosing Node or Cell Values* (p. 1409) for details.

Auto Range

specifies that the minimum and maximum values of the scalar field will be the limits of that field. If this option is not selected, you can enter **Min** and **Max** values manually. These values determine the range of the color scale.

Draw Mesh

when enabled opens the *Mesh Display Dialog Box* (p. 1635) where you can specify how to display your mesh.

Accuracy Control

allows you to specify tolerance to control the pathlines accuracy.

Relative Pathlines

allows you to display the pathlines relative to the rotating reference frame.

XY Plot

enables the display of an XY plot along the pathline trajectories. When this option is selected, the **Display** push button will change to **Plot**.

Write to File

activates the file-writing option. When this option is selected, the **Type** option becomes active and the **Plot** push button will change to **Write...**. Clicking on the **Write...** button will open *The **Select File** Dialog Box* (p. 33), in which you can specify a name and save a file containing the XY plot data. The format of this file is described in *XY Plot File Format* (p. 1477).

Type

specifies the type of the file you want to write.

CFD-Post

allows you to write the file in CFD-Post compatible format, which can be read in **CFD-Post**.

Fieldview

allows you to write the file in **FIELDVIEW** format, which can be read in **FIELDVIEW**.

Geometry

allows you to write the file in.ibl format, which can be read in GAMBIT.

EnSight

allows you to write the file in.encas format, which can be read in EnSight.

Pulse Mode

specifies either a single or continuous release of particles that follow the pathlines, starting at the release surface, when you use the **Pulse** button to animate the pathlines.

Continuous

sets the pulse mode to continuously release particles from the initial positions.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Single
sets the pulse mode to release a single wave of particles.

The **Pulse Mode** is used only when particles are being pulsed.

Style
sets the pathline style. Pathlines can be displayed as lines, ribbons, spheres, cylinders, or a set of points. The **ribbon** style also uses the **Twist By** field and the **TwistFactor** value (specified in the *Ribbon Attributes Dialog Box* (p. 1979)). Pulsing can be done only on **point** or **line** styles.

Attributes...
opens the *Path Style Attributes Dialog Box* (p. 1979) or the *Ribbon Attributes Dialog Box* (p. 1979), depending on the selected **Style**. These dialog boxes let you set the attributes (ribbon width, marker size, cylinder radius, twist-by field, etc.) for the chosen pathline style.

Step Size
sets the interval used for computing the next position of a particle. This is in units of length. Particle positions are always computed when they enter/leave a cell. If you specify a very large size, the particle positions at entry/exit of each cell will still be computed (and displayed).

Tolerance
allows you to control the error when using large time step sizes for the calculation. This is available when **Accuracy Control** is selected under **Options**.

Steps
sets the maximum number of steps a particle can advance. A particle's path may also end if it leaves the domain.

Path Skip
allows you to "thin" or "sample" the pathlines that are displayed. See *"Thinning" Pathlines* (p. 1404) for details.

Path Coarsen
reduces the time and the number of points plotted in a pathline. Coarsening factor of 'n' will result in plotting of each 'n'th point for a given pathline in each cell.

On Zone
contains a list from which you can select the zone on which the particles are constrained to lie. This list is activated only when the **Oil Flow** option is selected.

Color by
contains a list from which you can select the scalar field to be used to color the pathlines. The default is **Particle ID**, a unique ID for each particle.

Y Axis Function
contains a list of solution variables that can be used for the y axis of the plot.

This item appears when the **XY Plot** option is turned on.

X Axis Function
contains a list of functions for the x axis of the plot. You can plot the quantity selected in the **Y Axis Function** drop-down list as a function of the **Time** elapsed along the trajectory, or the **Path Length** along the trajectory.

This item appears when the **XY Plot** option is turned on.

Min/Max
display the values to which the lower and upper ends of the color scale map. If you are using the **Auto Range** option, these values will be automatically computed when you press **Compute**. If you are not using **Auto Range**, you can enter values manually.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Release from Surfaces
selects the surfaces from which to release particles. You must select at least one surface before any particles can be released.

Highlight Surfaces
when enabled highlights the surfaces (selected in the **Pathlines** dialog box) in the graphics window.

New Surface
is a drop-down list button that contains a list of surface options:

Point
opens the *Point Surface Dialog Box* (p. 1927).

Line/Rake
opens the *Line/Rake Surface Dialog Box* (p. 1928).

Plane
opens the *Plane Surface Dialog Box* (p. 1929).

Quadric
opens the *Quadric Surface Dialog Box* (p. 1931).

Iso-Surface
opens the *Iso-Surface Dialog Box* (p. 1933).

Iso-Clip
opens the *Iso-Clip Dialog Box* (p. 1935).

EnSight Encas File Name
allows you to specify a.encas file name if you selected **EnSight** under **Type**.

Browse...
opens the *The **Select File** Dialog Box* (p. 33) where you can select the `.encas` file.

Time Steps For EnSight Export
allows you to set the number of time levels that are available for animation in EnSight.

Display
displays the pathlines and records all dialog box settings.

Plot
displays an XY plot along the pathline trajectories. This button replaces the **Display** button when the **XY Plot** option is turned on.

Write...
opens *The **Select File** Dialog Box* (p. 33), in which you can save the XY plot data to a file. This button replaces the **Plot** button when the **Write to File** option is turned on.

Pulse
animates the position of particles. If **Pulse Mode** is set to **Continuous**, particles are reintroduced at the seed positions repeatedly. If the mode is **Single**, a single wave of particles moves through the domain.

The label of this button changes to **Stop !** when the animation is in progress. Press **Stop !** to stop pulsing (and the label goes back to **Pulse**).

Compute
computes the **Min** and **Max** for the field chosen in **Color by**.

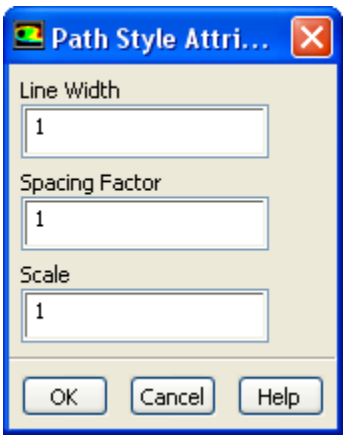
Axes...
opens the *Axes Dialog Box* (p. 2022), which allows you to customize the XY plot axes. This item appears when the **XY Plot** option is turned on.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Curves...
opens the *Curves Dialog Box* (p. 2024), which allows you to customize the curves used in the XY plot. This item appears when the **XY Plot** option is turned on.

35.19.8. Path Style Attributes Dialog Box

To modify the line width, cylinder radius or marker size, use the **Path Style Attributes** dialog box. You can open this dialog box by clicking the **Attributes...** button in the *Pathlines Dialog Box* (p. 1975). See *Controlling the Pathline Style* (p. 1403) for details about the items below.



Controls

Line Width/Marker Size/Width/
determines the thickness of the pathlines.

Diameter
specifies the diameter of the sphere. This parameter appears only when **sphere** is selected under **Style** in the **Pathlines** dialog box.

Spacing Factor
controls the spacing of arrows when you use the **line-arrows** style.

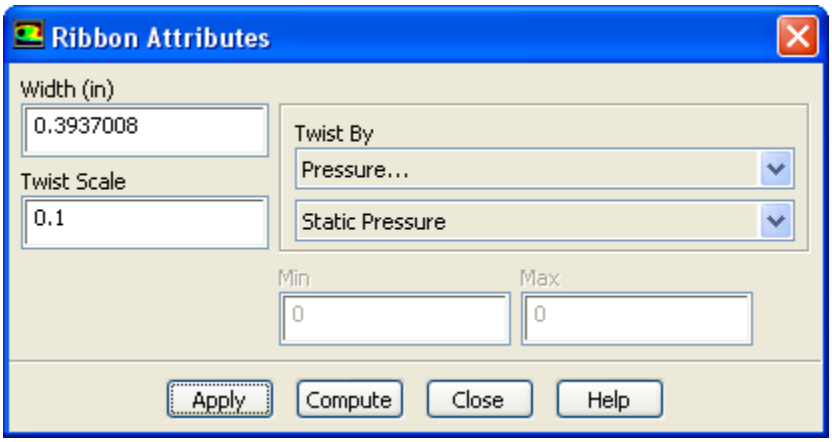
Scale
controls the size of the arrow heads when you use the **line-arrows** style.

Detail
specifies the detail applied to the graphical rendering of the spheres. This parameter appears only when **sphere** is selected under **Style** in the **Pathlines** dialog box.

35.19.9. Ribbon Attributes Dialog Box

To modify the ribbon width and set the scalar field by which to twist the ribbon, use the **Ribbon Attributes** dialog box. You can open this dialog box by clicking the **Attributes...** button in the *Pathlines Dialog Box* (p. 1975) when the selected **Style** is ribbon. See *Controlling the Pathline Style* (p. 1403) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Width
determines the thickness of the ribbon.

Twist Scale
sets the amount of twist for a given field. To magnify the twist for a field with very little change, increase this factor; to display less twist for a field with dramatic changes, decrease this factor.

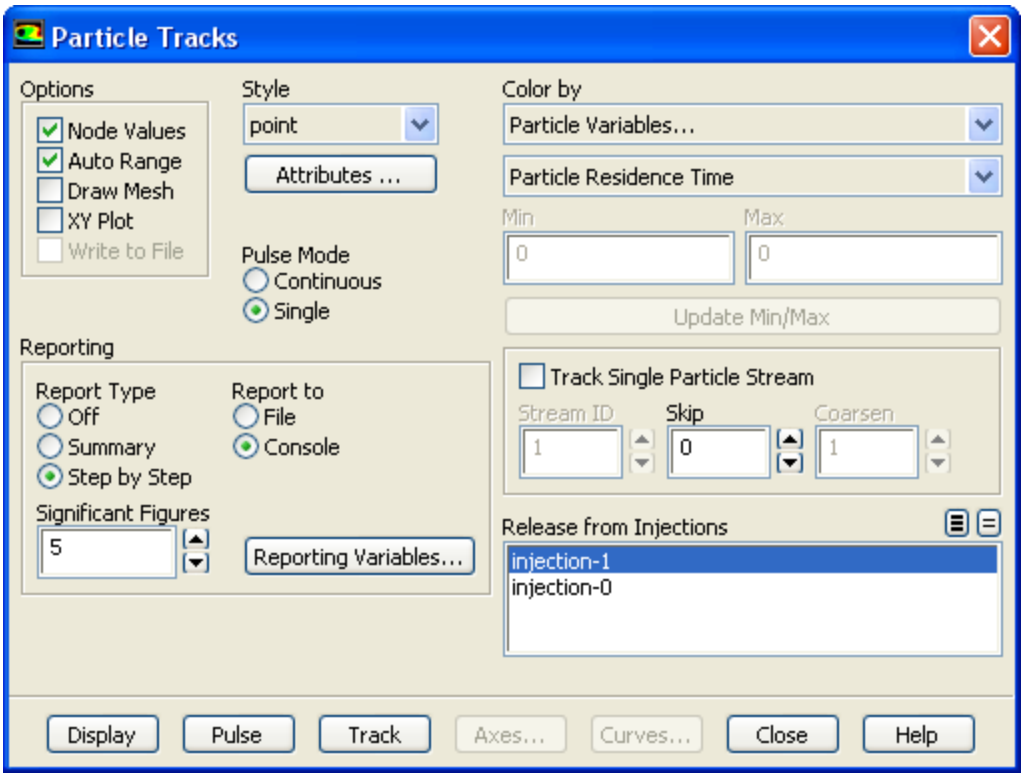
Twist By
contains a drop-down list from which you can select a scalar field on which pathline twisting is based.

Min/Max
displays the minimum/maximum value of the scalar field selected in **Twist By**.

35.19.10. Particle Tracks Dialog Box

The **Particle Tracks** dialog box controls the generation and display of discrete phase particles. See *Displaying of Trajectories* (p. 1068) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains the options described below:

Node Values

specifies that node values should be interpolated to compute the scalar field at a particle location. This option is turned on by default. See *Choosing Node or Cell Values* (p. 1409) for details.

Auto Range

specifies that the minimum and maximum values of the scalar field will be the limits of that field. If this option is not selected, you can enter **Min** and **Max** values manually. These values determine the range of the color scale.

Draw Mesh

toggles between displaying and not displaying the mesh. The *Mesh Display Dialog Box* (p. 1635) is opened when **Draw Mesh** is selected.

XY Plot

enables the display of an XY plot along the particle trajectories. When this option is selected, the **Display** push button will change to **Plot**.

Write to File

(available only when **XY Plot** is on) activates the file-writing option. When this option is selected, the **Plot** push button will change to **Write...**. Clicking on the **Write...** button will open *The **Select File** Dialog Box* (p. 33), in which you can specify a name and save a file containing the XY plot data. The format of this file is described in *XY Plot File Format* (p. 1477).

Reporting

allows you to specify how you would like to report particle tracks.

Report Type

controls the type of trajectory-fate reports to be displayed.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Off
disables reporting of trajectory fates.

Summary
enables summary reports of trajectory fates. See *Reporting of Trajectory Fates* (p. 1072) for details.

Step by Step
enables the step-by-step reporting of trajectories. This item will not appear if you have requested unsteady tracking in the *Discrete Phase Model Dialog Box* (p. 1723). See *Step-by-Step Reporting of Trajectories* (p. 1078) for details.

Current Positions
enables the reporting of the positions and velocities of all particles that are in the domain at the current time. This item appears only when unsteady tracking has been requested in the *Discrete Phase Model Dialog Box* (p. 1723). See *Reporting of Current Positions for Unsteady Tracking* (p. 1080) for details.

Report to
indicates the destination of the trajectory report.

File
enables the writing of the trajectory report to a file. When this option is enabled, the **Track** button will become the **Write...** button.

Console
enables the display of the trajectory report information in the console window.

Significant Figures
controls the number of significant figures used when a **Step by Step** or **Current Positions** report is selected.

Reporting Variables...
opens the *Reporting Variables Dialog Box* (p. 1984) that contains a list from which you can select the scalar field to be used to color the particle tracks.

Style
sets the trajectory style. Trajectories can be displayed as lines, ribbons, spheres, cylinders, or a set of points. The **ribbon** style also uses the **Twist By** field and the **Twist Scale** value (specified in the *Ribbon Attributes Dialog Box* (p. 1979)). Pulsing can be done only on **point** or **line** styles.

Attributes...
opens the *Path Style Attributes Dialog Box* (p. 1979) or the *Ribbon Attributes Dialog Box* (p. 1979), depending on the selected **Style**. These dialog boxes let you set the attributes (ribbon width, marker size, cylinder radius, twist-by field, etc.) for the chosen trajectory style.

Pulse Mode
specifies either a single or continuous release of particles that follow the trajectories, starting at the release surface, when you use the **Pulse** button to animate the trajectories.

Continuous
sets the pulse mode to continuously release particles from the initial positions.

Single
sets the pulse mode to release a single wave of particles.

The **Pulse Mode** is used only when particles are being **Pulse**d.

Y Axis Function
contains a list of solution variables that can be used for the y axis of the plot.

This item appears when the **XY Plot** option is turned on.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X Axis Function

contains a list of functions for the x axis of the plot. You can plot the quantity selected in the **Y Axis Function** drop-down list as a function of the **Time** elapsed along the trajectory, or the **Path Length** along the trajectory.

This item appears when the **XY Plot** option is turned on.

Min/Max

display the values to which the lower and upper ends of the color scale map. If you are using the **Auto Range** option, these values will be automatically computed when you press **Compute**. If you are not using **Auto Range**, you can enter values manually.

Update Min/Max

computes the **Min** and **Max** for the field chosen in **Color by**.

Track PDF Transport Particles

enables the tracking of PDF transport particles. This item is available only when the composition PDF transport model is enabled.

Track Single Particle Stream

enables the tracking of a single particle stream in the selected injection, instead of all the streams in that injection. See *Specifying Individual Particles for Display* (p. 1070) for details.

Stream ID

specifies the particle stream to be tracked when the **Track Single Particle Stream** option is enabled.

Skip

allows you to "thin" or "sample" the particles that are displayed when the **Track PDF Transport Particles** option is enabled.

Coarsen

reduces the plotting time by reducing the number of points that are plotted for a given trajectory in any cell. This is only valid for steady-state cases

Release from Injections

selects the injections from which to release particles. You must select at least one injection before any particles can be released.

Display

displays the trajectories and generates a trajectory report in the console window (if requested).

Plot

displays an XY plot along the particle trajectories. This button replaces the **Display** button when the **XY Plot** option is turned on.

Write...

opens *The **Select File** Dialog Box* (p. 33), in which you can save the XY plot data or trajectory report to a file. This button replaces the **Plot** button when the **Write to File** option is turned on, or the **Track** button when the **File** option is selected under **Report to**.

Pulse

animates the position of particles. If **Pulse Mode** is set to **Continuous**, particles are reintroduced at the seed positions repeatedly. If the mode is **Single**, a single wave of particles moves through the domain.

The label of this button changes to **Stop !** when the animation is in progress. Press **Stop !** to stop pulsing (and the label goes back to **Pulse**).

Track

computes the particle trajectories and generates any reports without displaying the trajectories in the graphics window.

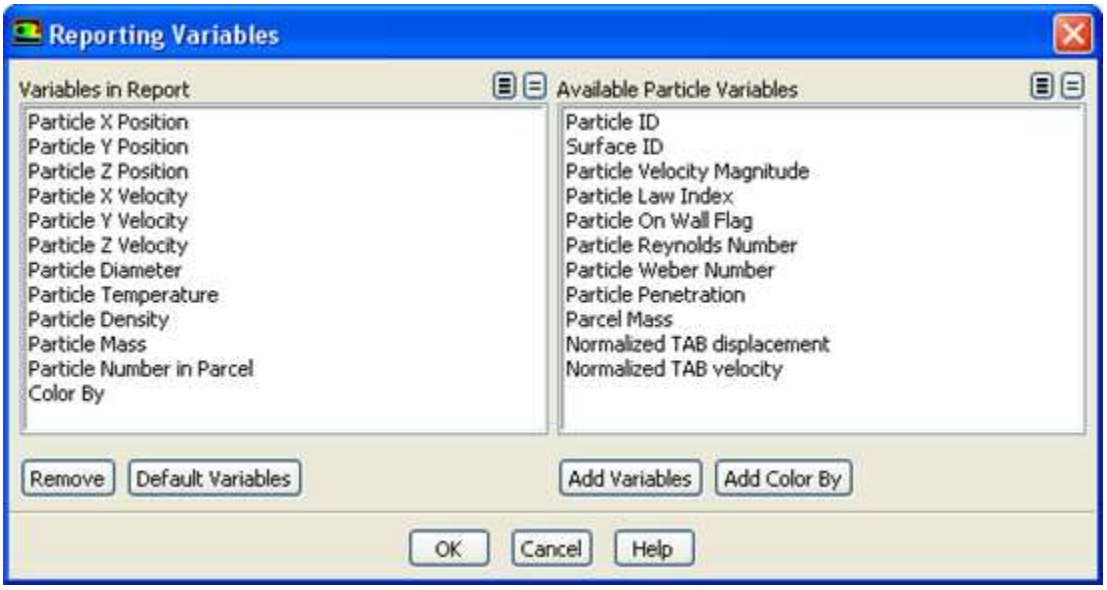
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Axes...
opens the *Axes Dialog Box* (p. 2022), which allows you to customize the XY plot axes. This item appears when the **XY Plot** option is turned on.

Curves...
opens the *Curves Dialog Box* (p. 2024), which allows you to customize the curves used in the XY plot. This item appears when the **XY Plot** option is turned on.

35.19.11. Reporting Variables Dialog Box

The **Reporting Variables** dialog box allows you to control the particle variables that you include in your reporting. See *Step-by-Step Reporting of Trajectories* (p. 1078) for details about the items below.



Controls

Variables in Report
contains all variables currently in the report.

Remove
removes the selected variable from the report.

Default Variables
restores the default list.

Available Particle Variables
contains the particle variables that are available for you to select.

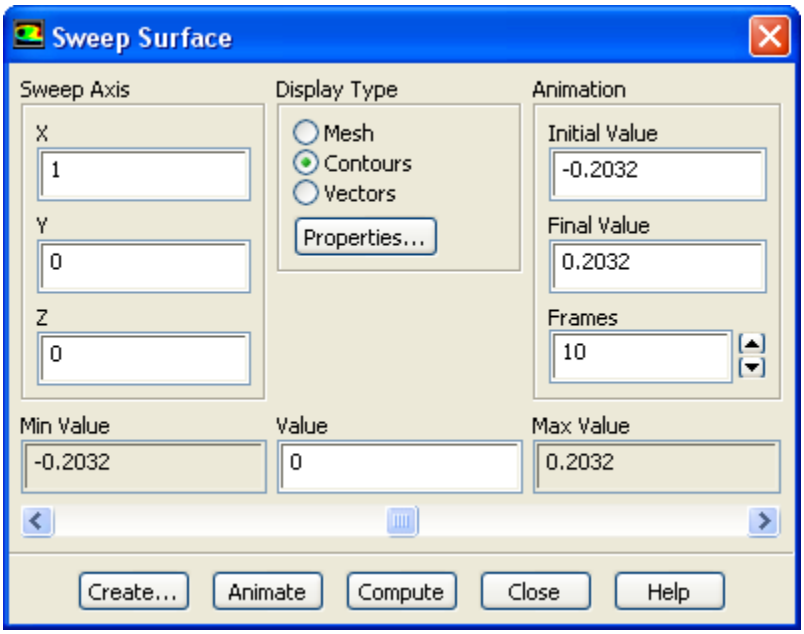
Add Variables
takes the selected variable from the **Available Particle Variables** list and adds it to the **Variables in Report** list.

Add Color By
adds the **Color by** variable to the **Variables in Report** list.

35.19.12. Sweep Surface Dialog Box

The **Sweep Surface** dialog box controls the display and animation of mesh, contour, and vector plots generated on a sweep surface. See *Displaying Results on a Sweep Surface* (p. 1409) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Sweep Axis
specifies the (**X**, **Y**, **Z**) vector representing the axis along which the surface should be swept.

Display Type
specifies the type of display to be swept through the domain (**Mesh**, **Contours**, or **Vectors**).

Properties...
opens the *Contours Dialog Box* (p. 1967) if **Contours** is the selected **Display Type**, or the *Vectors Dialog Box* (p. 1970) if **Vectors** is the selected **Display Type**. (This button is not available if **Mesh** is the selected **Display Type**.)

Animation
contains controls for animating the sweep-surface display.

Initial Value, Final Value
specify the initial and final positions for the animation.

Frames
specifies the number of frames in the animation.

Min Value, Max Value
show the minimum and maximum extents of the domain along the specified **Sweep Axis**. These values are updated when you click **Compute**.

Value
shows the current position at which the requested display is plotted. You can change the value by moving the slide bar below it, or by entering a new value and pressing the <RETURN> key.

Create...
opens the *Create Surface Dialog Box* (p. 1986), where you can create a surface from the currently-displayed sweep surface.

Animate
animates the display, sweeping the requested display through the domain along the specified axis.

Compute
updates the **Min Value** and **Max Value** to reflect the minimum and maximum extents of the domain along the specified **Sweep Axis**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.19.13. Create Surface Dialog Box

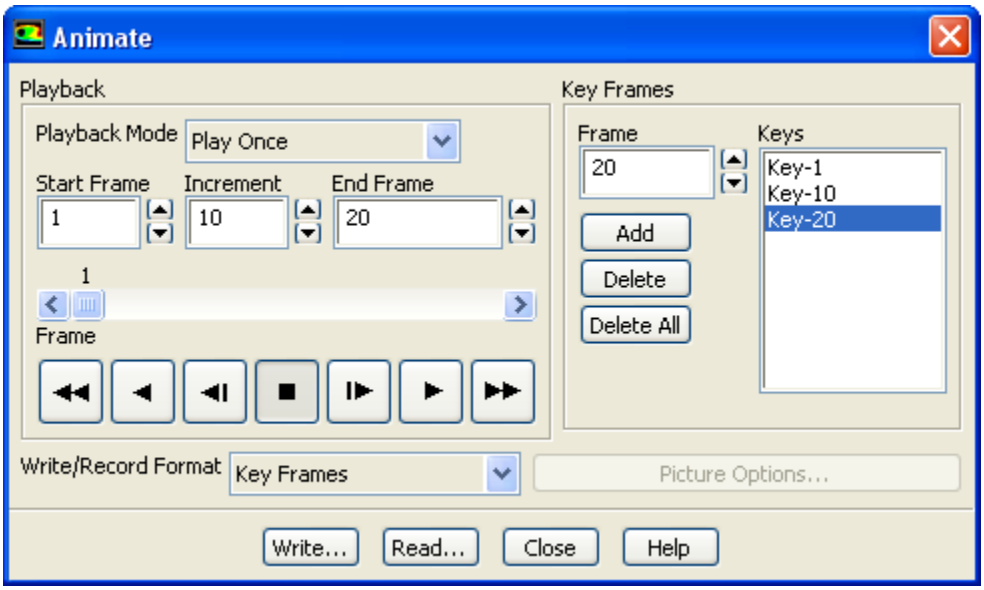
The **Create Surface** dialog box allows you to save a sweep surface for later use. You can open it by clicking **Create...** in the *Sweep Surface Dialog Box* (p. 1984). See *Displaying Results on a Sweep Surface* (p. 1409) for details about the items below.

Controls

Surface Name
specifies a name for the surface to be created.

35.19.14. Animate Dialog Box

The **Animate** dialog box allows you to specify key frames that define the basic movement of an animated sequence, and then play back the animation. ANSYS FLUENT interpolates between your specified key frames. See *Animating Graphics* (p. 1454) for details about the items below.



Controls

Playback
contains the controls that you use to play back the animation. See *Playing an Animation* (p. 1455) for details.

Playback Mode
contains a drop-down list of playback options.

Play Once
sets the option to play back frames from **Start Frame** to **End Frame** once.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Auto Repeat
sets the option to continually play back frames from **Start Frame** to **End Frame**.

Auto Reverse
sets the option to continually play back the images while reversing playback direction after each set.

Start Frame, End Frame
set the frames at which the animation should begin and end. By changing these numbers you can view a subset of the frames.

Increment
sets the number of frames to increment the frame-counter by when you use the fast-forward or fast-reverse buttons.

Frame
shows the number of the frame that is currently displayed, as well as its relative position in the entire animation. If you slide the bar to a different location, the frame corresponding to the new frame number will be displayed in the graphics window.

(Tape Player Buttons)
allow you to play the animation forward and backward, fast-reverse and fast-forward the animation, and stop it. The buttons function in a way similar to those on a standard video cassette player.

Key Frames
contains the controls that you use to define the key frames for the animation. See *Creating an Animation* (p. 1455) for details.

Frame
sets the number to be assigned to the next key frame added to the list of **Keys**.

Keys
contains a list of the key frames that have been defined. If you select a key frame in this list, the associated scene will be displayed in the graphics window.

Add
creates a key frame with the number shown in **Frame** for the scene currently displayed in the graphics window.

Important

Be sure to change the frame number before you add the new key frame so that you will not overwrite the last key frame that you created.

Delete
deletes the key frame that is selected in the **Keys** list.

Delete All
deletes all key frames in the **Keys** list.

Write/Record Format
specifies **Key Frames**, **Picture Files**, **MPEG**, or **Video** (not available on Windows) as the format in which to save the animation. See *Saving an Animation* (p. 1456) for details about these options.

Picture Options...
opens the *Save Picture Dialog Box* (p. 1988), in which you can specify parameters for saving the animation to picture files. This button is available only when **Picture Files** is selected as the **Write/Record Format**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Write...

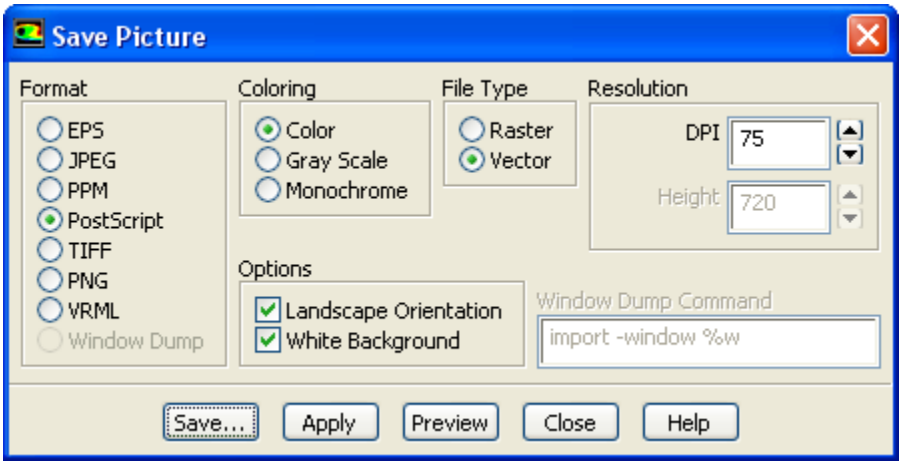
opens *The **Select File** Dialog Box* (p. 33), in which you can specify a name for the animation file and save it.

Read...

opens the **Select File** dialog box, in which you can specify the name of the animation file to be read. Note that the current case and data should contain the surfaces and any other information that the key frame description refers to. See *Reading an Animation File* (p. 1458).

35.19.15. Save Picture Dialog Box

The **Save Picture** dialog box allows you to set save picture parameters and save picture files of graphics windows. See *Saving Picture Files* (p. 117) for details on the use of this dialog.



Controls

Format

allows you to select the format of picture files.

EPS

(Encapsulated PostScript) output is the same as PostScript output, with the addition of Adobe Document Structuring Conventions (v2) statements. Currently, no preview bitmap is included in EPS output. Often, programs which import EPS files use the preview bitmap to display on-screen, although the actual vector PostScript information is used for printing (on a PostScript device). You can save EPS files in raster or vector format.

JPEG

is a common raster file format.

PPM

output is a common raster file format.

PostScript

is a common vector file format. You can also choose to save a PostScript file in raster format.

TIFF

is a common raster file format.

PNG

is a common raster file format.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VRML
is a graphics interchange format that allows export of 3D geometrical entities that you can display in the ANSYS FLUENT graphics window. This format can commonly be used by VR systems and in particular the 3D geometry can be viewed and manipulated in a web-browser graphics window.

Important

Non-geometric entities such as text, titles, color bars, and orientation axis are not exported. In addition, most display or visibility characteristics set in ANSYS FLUENT, such as lighting, shading method, transparency, face and edge visibility, outer face culling, and hidden line removal, are not explicitly exported but are controlled by the software used to view the VRML file.

Window Dump
(UNIX systems only) selects a window dump operation for generating the picture. With this format, you will need to specify the appropriate **Window Dump Command**.

Coloring
(all formats except **Window Dump**) specifies the color mode for the picture file.

Color
specifies a color-scale copy.

Gray Scale
specifies a gray-scale copy.

Monochrome
specifies a black-and-white copy.

Important

Most monochrome PostScript devices will render **Color** images in shades of gray, but to ensure that the color ramp is rendered as a linearly-increasing gray ramp, you should select **Gray Scale**.

File Type
specifies the type of picture file to be saved. See *Choosing the File Type* (p. 120) for details.

Raster
specifies a raster type picture. The supported raster formats are **EPS**, **JPEG**, **PPM**, **PostScript**, **TIFF**, and **PNG**.

Vector
specifies a vector type picture. The supported vector formats are **EPS**, **PostScript**, and **VRML**.

Resolution
specifies the resolution or the size (in pixels) of the picture.

DPI
specifies the resolution of **EPS** and **PostScript** files in dots per inch (DPI). The default value for **DPI** is set to 75.

Width
specifies the width of the raster picture image.

Height
specifies the height of the raster picture image.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

*The default value for **Width** and **Height** is set to zero, so that the default picture is generated at the same resolution as the active graphics window.*

Options

contains additional options for all picture formats except **Window Dump**.

Landscape Orientation

specifies the orientation of the picture. If this option is enabled, the picture is made in landscape mode; otherwise, it is made in portrait mode.

White Background

controls the foreground/background color. If this option is enabled, the foreground and background colors of graphics windows being saved as pictures will be swapped. Hence, it allows you to save pictures with a white background and a black foreground, while the graphics windows are displayed with a black background and white foreground.

Window Dump Command

(UNIX systems only) specifies the command to be used to save the picture file, when you select the **Window Dump** format. See *Window Dumps (Linux/UNIX Systems Only)* (p. 121) for details.

Save...

opens *The **Select File** Dialog Box* (p. 33), in which you can specify a name for the picture file to be saved and then save the file. The resulting file will contain a picture of the active graphics window.

Apply

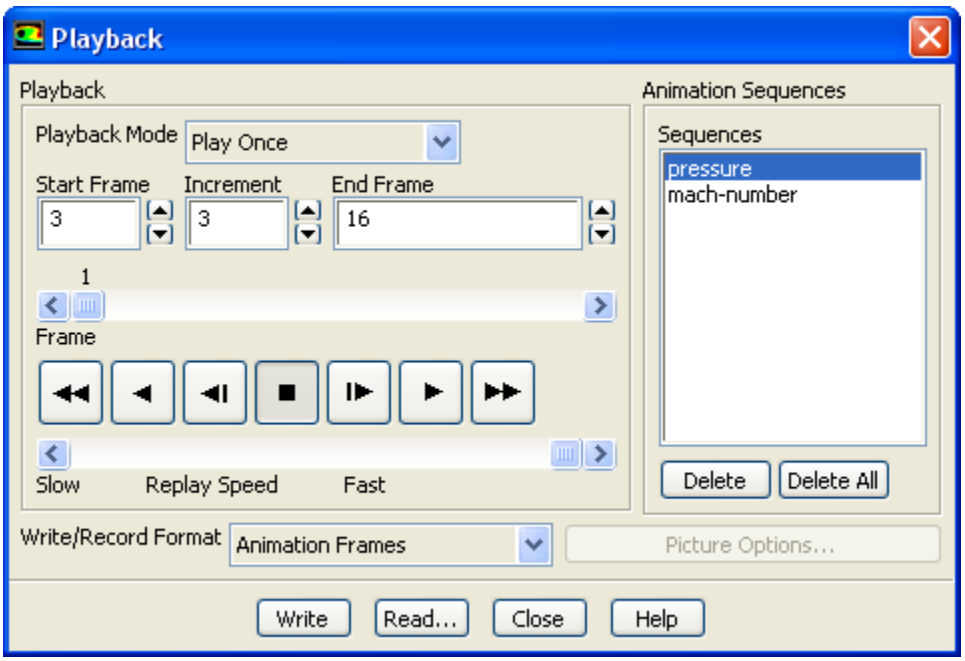
saves the current settings. ANSYS FLUENT will use these settings when making subsequent pictures.

Preview

applies the current settings to the active graphics window so that you can investigate the effects of different options interactively before saving the final picture.

35.19.16. Playback Dialog Box

The **Playback** dialog box allows you to play back an animation sequence. See *Playing an Animation Sequence* (p. 1300) for details about the items below.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Playback
contains the controls that you use to play back the selected animation sequence.

Playback Mode
contains a drop-down list of playback options.

Play Once
sets the option to play back frames from **Start Frame** to **End Frame** once.

Auto Repeat
sets the option to continually play back frames from **Start Frame** to **End Frame**.

Auto Reverse
sets the option to continually play back the images while reversing playback direction after each set.

Start Frame, End Frame
set the frames at which the animation should begin and end. By changing these numbers you can view a subset of the frames.

Increment
sets the number of frames to increment the frame-counter by when you use the fast-forward or fast-reverse buttons.

Frame
shows the number of the frame that is currently displayed, as well as its relative position in the entire animation. If you slide the bar to a different location, the frame corresponding to the new frame number will be displayed in the graphics window.

(Tape Player Buttons)
allow you to play the animation forward and backward, fast-reverse and fast-forward the animation, and stop it. The buttons function in a way similar to those on a standard video cassette player.

Replay Speed
controls the playback speed for the animation. Move the **Replay Speed** slider bar to the left to reduce the playback speed (and to the right to increase it).

Animation Sequences
contains the controls that you use to define the sequence to be played back.

Sequences
contains a list of the animation sequences that have been defined.

Delete
deletes the animation sequence that is selected in the **Sequences** list.

Delete All
deletes all animation sequences in the **Sequences** list.

Write/Record Format
specifies **Animation Frames**, **Picture Files**, or **MPEG** as the format in which to save the animation. See *Saving an Animation Sequence* (p. 1302) for details about these options.

Picture Options...
opens the *Save Picture Dialog Box* (p. 1988), in which you can specify parameters for saving the animation to picture files. This button is available only when **Picture Files** is selected as the **Write/Record Format**.

Write
saves the specified file(s) in the current working directory.

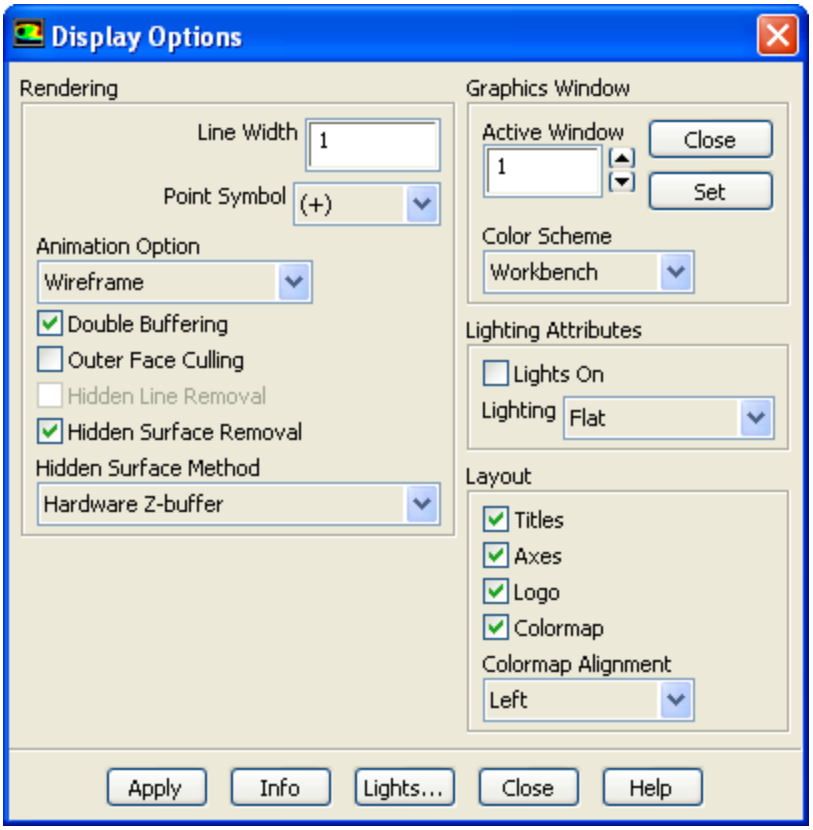
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Read...

opens *The **Select File** Dialog Box* (p. 33), in which you can specify the name of the solution animation file to be read. See *Reading an Animation Sequence* (p. 1303) for details.

35.19.17. Display Options Dialog Box

The **Display Options** dialog box provides an interactive mechanism for setting attributes or options that control how and where a scene is rendered.



Controls

Rendering

allows you to modify characteristics of the display that are related to the way in which scenes are rendered. See *Modifying the Rendering Options* (p. 1425) for details about these items.

Line Width

controls the thickness of lines. The default is 1.

Point Symbol

sets the symbol used for nodes and data points.

Animation Option

contains a drop-down list of animation options: **All** and **Wireframe**. **Wireframe** uses a wireframe representation of all geometry during mouse manipulation This option is turned on by default. You should turn it off only if your computer has a graphics accelerator; otherwise the mouse manipulation may be very slow.

Double Buffering

turns double buffering on or off, if it is supported by the driver. Double buffering dramatically reduces screen flicker during graphics updates. Note that if your display hardware does not support double

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

buffering and you turn this option on, double buffering will be done in software. Software double buffering uses extra memory.

Outer Face Culling

allows you to turn off the display of outer faces in wall zones. **Outer Face Culling** is useful for displaying both sides of a slit wall. By default, when you display a slit wall, one side will "bleed" through to the other. When you turn on the **Outer Face Culling** option, the display of a slit wall will show each side distinctly as you rotate the display. This option can also be useful for displaying two-sided walls (i.e., walls with fluid or solid cells on both sides).

Hidden Line Removal

turns hidden line removal on or off. If you do not use hidden line removal, ANSYS FLUENT will not try to determine which lines in the display are behind others; it will display all of them, and a cluttered display will result. You should turn this option off if you are working with a 2D problem or with geometries that do not overlap. Note that this option is not available when using the **Workbench Color Scheme**.

Hidden Surface Removal

turns hidden surface removal on or off. If you do not use hidden surface removal, ANSYS FLUENT will not try to determine which surfaces in the display are behind others; it will display all of them, and a cluttered display will result. You should turn this option off if you are working with a 2D problem or with geometries that do not overlap.

Hidden Surface Method

chooses the method to be used for hidden surface removal. These options vary in speed and quality, depending on the device you are using. The choices are listed below.

Hardware Z-buffer

is the fastest method if your hardware supports it. The accuracy and speed of this method is hardware dependent.

Painters

will show fewer edge-aliasing effects than hardware-z-buffer. This method is often used instead of software-z-buffer when memory is limited.

Software Z-buffer

is the fastest of the accurate software methods available (especially for complex scenes), but it is memory intensive.

Z-sort only

is a fast software method, but it is not as accurate as software-z-buffer.

Graphics Window

allows you to open and close graphics windows. See *Opening Multiple Graphics Windows* (p. 1412) for details.

Active Window

indicates the graphics window to be opened, closed, or set active. (A graphics window's ID is displayed in its title.)

Open/Close

opens or closes the window with the ID shown in the **Active Window** box. If the indicated window is open, the **Close** button will appear, and if the indicated window is not open, the **Open** button will appear.

Set

sets the window with the ID shown in the **Active Window** box to be the active graphics window. See *Setting the Active Window* (p. 1413) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Color Scheme
contains a drop-down list of available graphics window color schemes to choose from. Choices are **Workbench** (blue background) and **Classic** (black background).

Lighting Attributes
controls lighting attributes for all lights in the active graphics window. See *Adding Lights* (p. 1423) for details.

Lights On
turns *all* lights in the active graphics window on or off.

Lighting
specifies the method to be used in lighting interpolation: **Flat**, **Gouraud**, or **Phong**. (**Flat** is the most basic method: there is no interpolation within the individual polygonal facets. **Gouraud** and **Phong** have smoother gradations of color because they interpolate on each facet.)

Layout
controls the display of captions, axes and the colormap in the graphics display window. See *Changing the Legend Display* (p. 1413) for details.

Titles
enables/disables the display of all captions in the graphics display window.

Axes
enables/disables the display of the axis triad.

Logo
allows you to hide or display the ANSYS logo.

Colormap
enables/disables the display of the color scale.

Colormap Alignment
allows you to adjust the alignment of colormap in the graphics display. Select the side (i.e. **Top**, **Bottom**, **Left**, and **Right**) from the drop-down list, where you want to align the colormap.

Apply
applies the specified attributes and re-renders the scene in the active graphics window with the new attributes. To see the effect of the new attributes on other graphics windows, you must redisplay them.

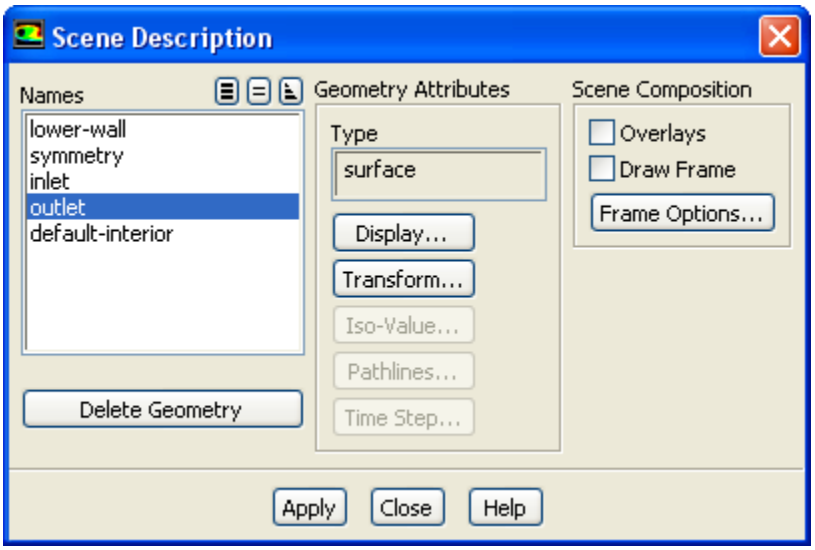
Info
prints out information about your graphics driver in the console.

Lights...
opens the *Lights Dialog Box* (p. 2005), which allows you to create, delete, and modify directional light sources.

35.19.18. Scene Description Dialog Box

The **Scene Description** dialog box allows you to turn overlays on and off, select geometric objects in the display for modification or deletion, and open dialog boxes that control various characteristics of the selected object(s). (Note that you cannot use the **Scene Description** dialog box to control XY plot and histogram displays.) See *Composing a Scene* (p. 1444) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Names

contains a list of the geometric objects that currently exist in the scene (including those that are presently invisible). You can specify the object or objects to be manipulated by selecting names in this list. If you select more than one object at a time, any operation (transformation, color specification, etc.) will apply to all the selected objects. You can also select objects by clicking on them in the graphics display using the mouse probe button, which is, by default, the right mouse button. (See *Controlling the Mouse Button Functions* (p. 1427) for information about mouse button functions.) To deselect a selected object, simply click on its name in the **Names** list. See *Selecting the Object(s) to be Manipulated* (p. 1445)for details.

Geometry Attributes

contains information about the type of the selected geometric object and push buttons which open dialog boxes for modifying the object.

Type

reports the type of the selected object. Possible types include `mesh`, `surface`, `contour`, `vector`, and `Group`. This information is especially helpful when you need to distinguish two or more objects with the same name. When more than one object is selected, the type displayed is `Group`.

Display...

opens the *Display Properties Dialog Box* (p. 1996), which allows you to change the color, visibility, and other properties for the selected object.

Transform...

opens the *Transformations Dialog Box* (p. 1997), which allows you to translate, rotate, and scale the selected object.

Iso-Value...

opens the *Iso-Value Dialog Box* (p. 1998), which allows you to change the isovalue of an isosurface. This push button is available only if the geometric object selected in the **Names** list is an isosurface or an object on an isosurface (contour on an isosurface, for example); otherwise it is grayed out.

Pathlines...

opens the *Pathline Attributes Dialog Box* (p. 1999), which allows you to set the maximum number of steps for the selected pathlines. This is most useful in animating the path of a set of particles.

Scene Composition

contains controls for enabling overlays and bounding frames.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Overlays
activates the superimposition of a new geometry onto a currently displayed geometry. See *Overlay of Graphics* (p. 1411) for details.

Draw Frame
activates the display of a bounding frame in the graphics display. See *Adding a Bounding Frame* (p. 1452) for details.

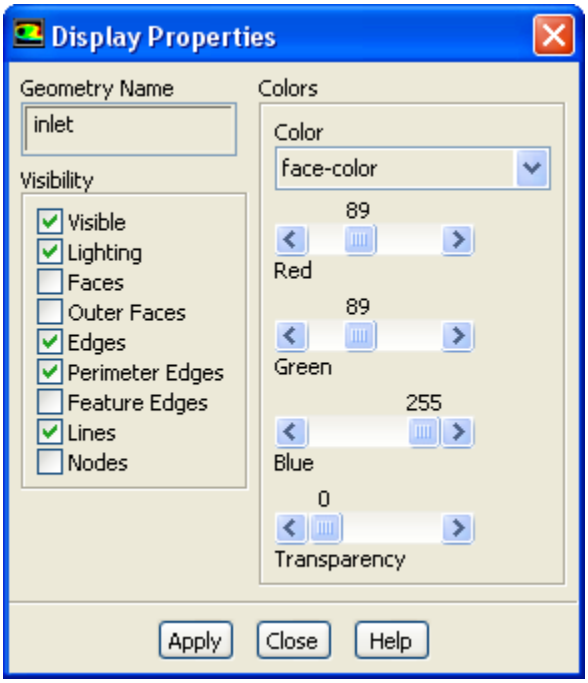
Frame Options...
opens the *Bounding Frame Dialog Box* (p. 2000), in which you can define properties of the bounding frame. See *Adding a Bounding Frame* (p. 1452) for details.

Delete Geometry
deletes the geometric object that is currently selected in the **Names** list. The ability to delete individual objects is especially useful if you have overlays on and you generate an unwanted object (e.g., if you generate contours of the wrong variable). You can simply delete the unwanted object and continue your scene composition, instead of starting over from the beginning.

Apply
saves the status of **Overlays** and **Draw Frame**. When you turn **Overlays** or **Draw Frame** on or off, you must click the **Apply** button to see the effect of the change on subsequent display operations.

35.19.19. Display Properties Dialog Box

To modify the color, visibility, and other display properties for individual geometric objects in the graphics display, use the **Display Properties** dialog box. You can open this dialog box by clicking the **Display...** push button in the *Scene Description Dialog Box* (p. 1994). See *Changing an Object's Display Properties* (p. 1446) for details about the items below.



Controls

Geometry Name
displays the name of the object you selected for modification in the *Scene Description Dialog Box* (p. 1994).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Visibility

contains check buttons that control options related to the visibility of the selected object. See *Controlling Visibility* (p. 1446) for details.

Visible

toggles the visibility of the selected object. If it is turned on, the object will be visible in the display, and if it is turned off, the object will be invisible.

Lighting

turns the effect of lighting for the selected object on or off. You can choose to have lighting affect only certain objects instead of all of them. Note that if **Lighting** is turned on for an object such as a contour or vector plot, the colors in the plot will not be exactly the same as those in the colormap at the left of the display.

Faces

toggles the filled display of faces for the selected mesh or surface object. Turning **Faces** on has the same effect as turning on the display of faces in the *Mesh Display Dialog Box* (p. 1635).

Outer Faces

toggles the display of outer faces.

Edges

toggles the display of interior and exterior edges of the geometric object.

Perimeter Edges

toggles the display of the outline of the geometric object. (This option has no effect on the display of meshes.)

Feature Edges

toggles the display of feature lines (if any) of the geometric object.

Lines

toggles the display of the lines (if any) in the geometric object.

Nodes

toggles the display of the nodes (if any) in the geometric object.

Colors

contains controls for setting face, edge, line, and node colors, and transparency for faces. See *Controlling Object Color and Transparency* (p. 1447) for details.

Color

specifies the face, edge, line, or node color for modification. When you turn on this button, the color scales below will show the current color specification, which you can modify by moving the sliders on the color scales.

Red, Green, Blue

are color scales with which you can specify the RGB components of the face, edge or line color.

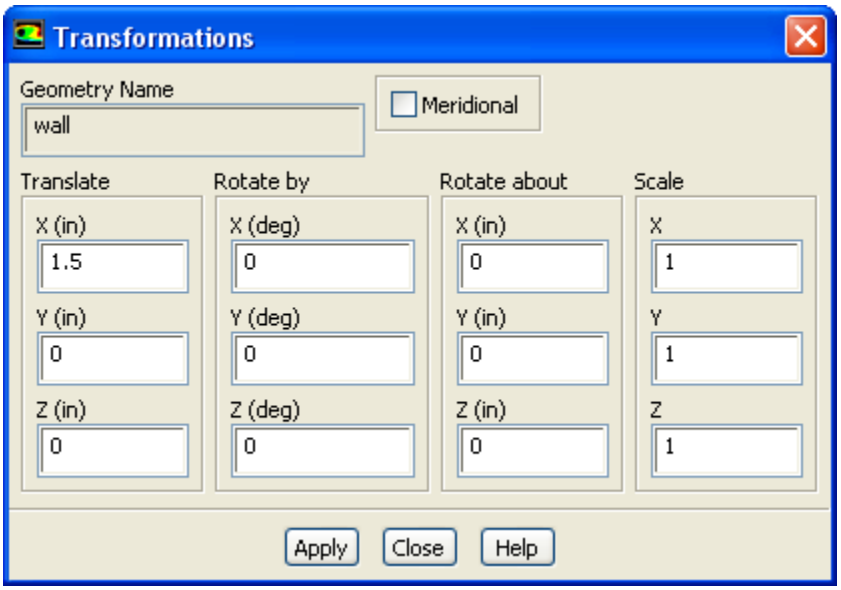
Transparency

sets the relative transparency of the selected object. An object with a transparency of 0 is opaque, and an object with a transparency of 100 is transparent.

35.19.20. Transformations Dialog Box

You can use the **Transformations** dialog box to translate, rotate, or scale individual objects in the graphics display. To open this dialog box, click the **Transform...** push button in the *Scene Description Dialog Box* (p. 1994). See *Transforming Geometric Objects in a Scene* (p. 1448) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Geometry Name
displays the name of the object you selected for modification in the *Scene Description Dialog Box* (p. 1994).

Meridional
(3D only) enables the display of the meridional view. This option is especially useful in turbomachinery applications.

Translate
contains **X**, **Y**, and **Z** real number fields in which you can enter the distance by which to translate the selected object in each direction.

Rotate by
contains **X**, **Y**,and **Z** integer number fields in which you can enter the number of degrees by which to rotate the selected object about each axis.

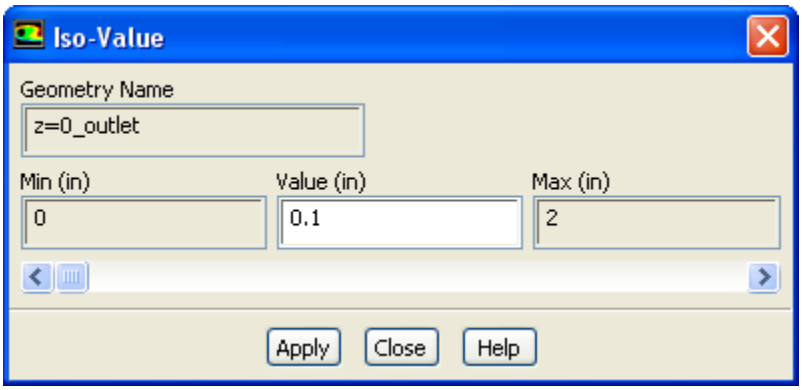
Rotate about
specifies the point about which to rotate the object.

Scale
contains **X**, **Y**, and **Z** real number fields in which you can enter the amount by which to scale the selected object in each direction. To avoid distortion of the object's shape, be sure to specify the same value for all three entries.

35.19.21. Iso-Value Dialog Box

The **Iso-Value** dialog box allows you to change the isovalue of an isosurface. The isosurface can be selected directly in the **Names** list or indirectly by selecting an object displayed on the isosurface. When you change the isovalue, any contours, vectors, etc. that were displayed on the original isosurface will be displayed on the isosurface with the new isovalue. To open this dialog box, click the **Iso-Value...** push button in the *Scene Description Dialog Box* (p. 1994). See *Modifying Iso-Values* (p. 1450) for details about using this dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

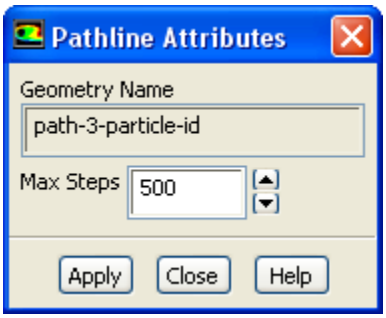
Geometry Name
displays the name of the geometric object (isosurface) you selected for modification in the *Scene Description Dialog Box* (p. 1994).

Min, Max
show the minimum and maximum values of the isosurface variable.

Value
sets the new isovalue for isosurfaces. After you change the value and click on **Apply**, contours, vectors, or pathlines that were displayed on the original isosurface will be displayed for the new isovalue. You can also use the slide bar to change the **Value**.

35.19.22. Pathline Attributes Dialog Box

The **Pathline Attributes** dialog box allows you to change the number of steps used in the computation of pathlines. This is most useful in creating animations of pathlines. To open this dialog box, click the **Pathlines...** button in the *Scene Description Dialog Box* (p. 1994). See *Modifying Pathline Attributes* (p. 1451) for details about using this dialog box.



Controls

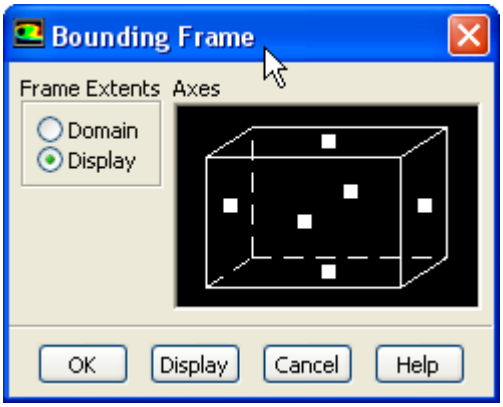
Geometry Name
displays the name of the geometric object you selected for modification in the *Scene Description Dialog Box* (p. 1994).

Max Steps
sets the new maximum number of steps for pathline computation. After you change the value and click on **Apply**, the selected pathline will be recomputed and redrawn.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.19.23. Bounding Frame Dialog Box

The **Bounding Frame** dialog box allows you to add a bounding frame with optional measure markings to the display of the domain. See *Adding a Bounding Frame* (p. 1452) for details about the items in this dialog box.



Controls

Frame Extents
indicates the extents of the bounding frame.

Domain
specifies that the frame should encompass the domain extents.

Display
specifies that the frame should encompass the portion of the domain that is shown in the display.

Axes
contains controls for specifying the frame boundaries and measurements. See *Adding a Bounding Frame* (p. 1452) for instructions on using these items.

Display
updates the active graphics window with the current frame settings.

35.19.24. Views Dialog Box

With the **Views** dialog box, you can make various modifications to the view displayed in the active graphics window. See *Modifying the View* (p. 1433) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Views

lists the currently defined views. Clicking on a view name highlights that name and enters it into the **Name** field. Double-clicking on a view name restores that view in the active graphics window.

Save Name

specifies the name to use when saving a view.

Actions

contains buttons for performing various actions related to the **Views** list and the **Save Name**.

Default

restores the "front" view in the active graphics window.

Auto Scale

modifies the view in the active graphics window by scaling and centering the current scene without changing its orientation.

Previous

allows you to return to previous displays.

Save

stores the view in the active graphics window with the name in the **Save Name** box. See *Saving Views* (p. 1440) for details.

Delete

removes the selected view name from the **Views** list.

Important

Be careful not to delete any of the pre-defined views.

Read...

opens *The **Select File** Dialog Box* (p. 33), in which you can specify the name of a view file to be read. See *Reading View Files* (p. 1440) for details.

Write...

opens the *Write Views Dialog Box* (p. 2002), in which you can select the views to be saved to a view file. See *Saving Views* (p. 1440) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mirror Planes

displays a list of all symmetry planes in the domain. Mirror images are drawn for all selected symmetry planes. See *Mirroring and Periodic Repeats* (p. 1441) for details.

Define Plane...

opens the *Mirror Planes Dialog Box* (p. 2002), in which you can define a mirror plane for a non-symmetric domain.

Periodic Repeats

indicates the number of periodic repetitions to be displayed. See *Mirroring and Periodic Repeats* (p. 1441) for details.

Define...

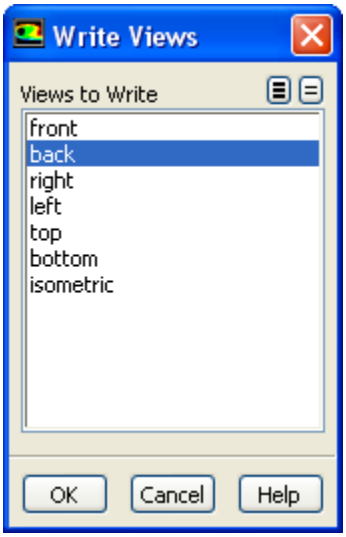
opens the *Graphics Periodicity Dialog Box* (p. 2003), in which you can define periodicity for a periodic domain.

Camera...

opens the *Camera Parameters Dialog Box* (p. 2005).

35.19.25. Write Views Dialog Box

The **Write Views** dialog box allows you to save selected views to a view file. To open it, click **Write...** in the *Views Dialog Box* (p. 2000). This feature allows you to transfer views between case files. See *Saving Views* (p. 1440) for details.



Controls

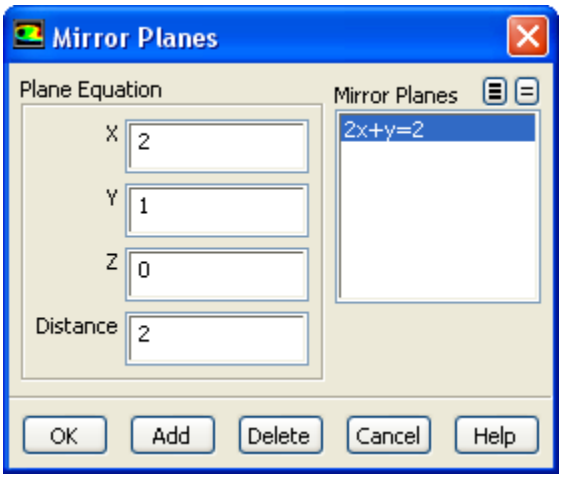
Views to Write

is a selectable list of the defined views. The selected views will be saved to a view file when you click on **OK**.

35.19.26. Mirror Planes Dialog Box

The **Mirror Planes** dialog box allows you to define a symmetry plane for a non-symmetric domain for use with graphics. To open it, click **Define Plane...** in the *Views Dialog Box* (p. 2000). See *Mirroring for Graphics* (p. 1444) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Plane Equation
contains inputs for specifying the equation for the mirror plane: A **X** + B **Y**+ C **Z** = **Distance**.

Mirror Planes
contains a list of all mirror planes you have defined using this dialog box. (Mirror planes that exist in the domain due to symmetry will not appear in this list, since they cannot be modified.)

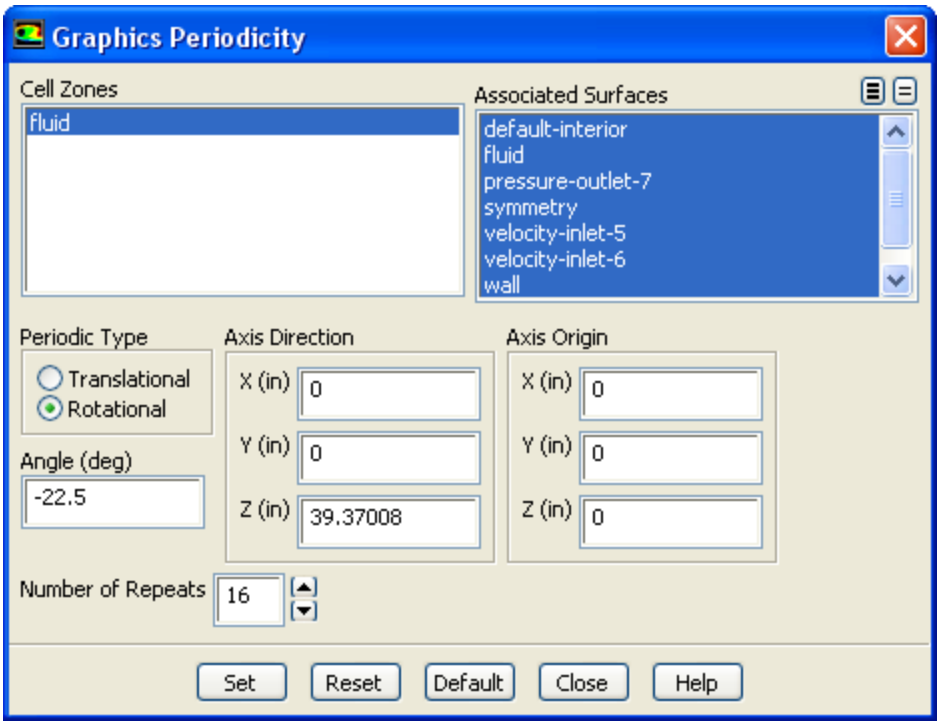
Add
adds the plane defined by the **Plane Equation** to the **Mirror Planes** list.

Delete
deletes the plane(s) selected in the **Mirror Planes** list.

35.19.27. Graphics Periodicity Dialog Box

The **Graphics Periodicity** dialog box allows you to define a periodic repeats, periodic rotation or translation for a non-periodic domain for use with graphics. To open it, click **Define...** under **Periodic Repeats** in the *Views Dialog Box* (p. 2000). See *Periodic Repeats for Graphics* (p. 1443) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Cell Zones

contains the list of the zones in the mesh. You can select one or more zones in this list and specify different periodicity parameters for each zone separately.

Associated Surfaces

contains the list of the surfaces associated with the selected cell zone.

Periodic Type

specifies **Rotational**or **Translational** periodicity.

Angle

specifies the angle by which the domain is rotated to create the periodic repeat. This item is available when you select **Rotational** as the **Periodic Type**.

Translation

specifies the distance in the **X**, **Y**, and **Z** directions by which the domain is translated to create the periodic repeat. This item will appear when you select **Translational** as the **Periodic Type**.

Axis Direction

specifies the direction vector (**X,Y,Z**) for the axis of rotation. This item is available when you select **Rotational** as the **Periodic Type** and the domain is three-dimensional.

Axis Origin

specifies the origin of the axis of rotation. This item is available when you select **Rotational** as the **Periodic Type**.

Number of Repeats

specifies the number of times you want to repeat the periodic domain.

Set

applies the periodicity you have defined for the case setup.

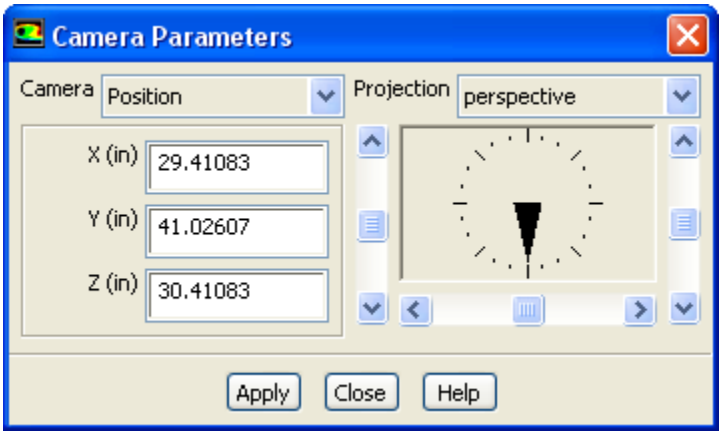
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Reset

removes any periodicity you have defined, and returns to the default periodicity for the domain (i.e., no periodicity for a non-periodic domain).

35.19.28. Camera Parameters Dialog Box

The **Camera Parameters** dialog box allows you to modify the "camera" through which you are viewing the graphics display. See *Controlling Perspective and Camera Parameters* (p. 1438) for details about the items below.



Controls

Camera

contains a drop-down list of the parameters that define the camera (**Position**, **Target**, **Up Vector**, and **Field**) and **X**, **Y**, and **Z** fields in which you can define the coordinates or field distances for the parameter selected in the drop-down list. *Figure 31.49* (p. 1439) illustrates the definition of the camera by these parameters.

Projection

contains a drop-down list that allows you to select a **Perspective** or **Orthographic** view.

(Dial and Sliders)

allow you to rotate and scale the graphics display. The slider on the scale to the left of the dial rotates the display about the horizontal axis at the center of the screen, the slider on the scale below the dial rotates the display about the vertical axis at the center of the screen, and the dial controls rotation about the axis at the center of and perpendicular to the screen. The slider on the scale to the right of the dial zooms in or out in the display. See *Rotating the Display* (p. 1435) and *Zooming the Display* (p. 1437) for details.

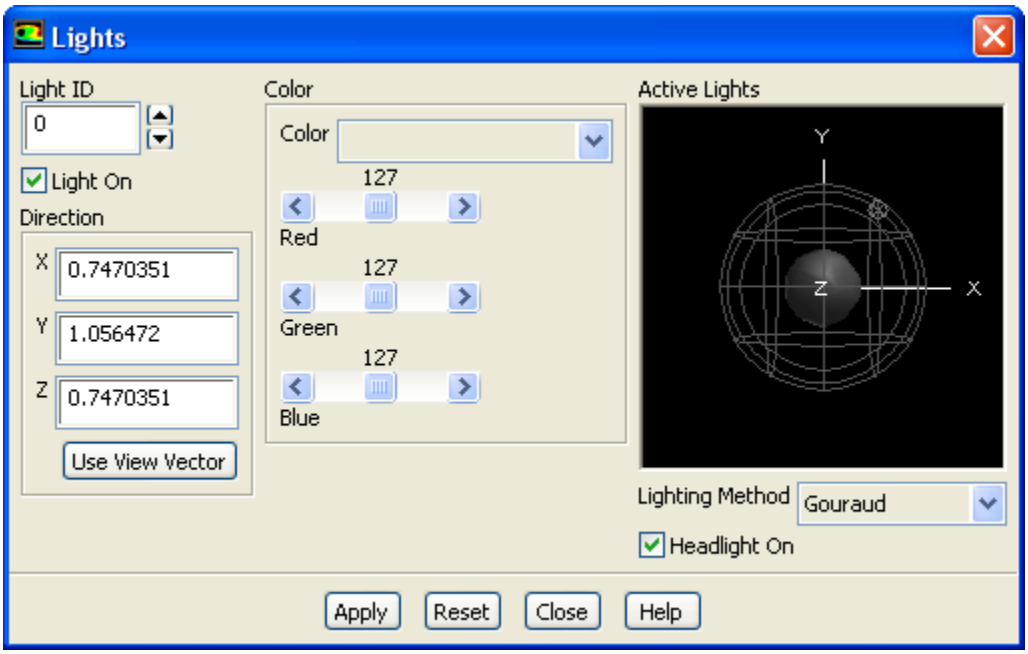
Important

When you are using the sliders and dial to manipulate the view, you may want to turn off **Wireframe Animation** in the *Display Options Dialog Box* (p. 1992), so that you can watch the display move interactively while you are moving the slider or the dial indicator.

35.19.29. Lights Dialog Box

The **Lights** dialog box provides an interactive mechanism for placing colored, directional lights in a scene. See *Adding Lights* (p. 1423) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Light ID

indicates the light that is being added, deleted, or modified. By default, light 1 is defined to be dark gray with a direction of (1,1,1).

Light On

indicates whether or not the light specified in **Light ID**is on or off. By turning off the **Light On** option for a particular light, you can remove this light from the display, while still retaining its definition. To add it to the display again, simply turn on the **Light On** button.

Direction

allows you to specify the direction of the light (the position on the unit sphere from which the light emanates) by entering the **X**, **Y**, and **Z** coordinates or by computing the coordinates based on the current view in the graphics window.

X,Y,Z

specify the direction of the light. For example, the direction (1,1,1) means that the rays from the light will be parallel to the vector from (1,1,1) to the origin.

Use View Vector

updates the **X,Y,Z** fields with the appropriate values for the current view in the active graphics window, and shines a light in that direction. Instead of entering the **X,Y,Z** values for a light's direction vector, you can use your mouse to change the view in the graphics window so that your position in reference to the geometry is the position from which you would like a light to shine. You can then click on the **Use View Vector** button to update the **X,Y,Z** fields with the appropriate values for your current position and update the graphics display with the new light direction. This method is convenient if you know where you want a light to be, but you are not sure of the exact direction vector.

Color

allows you to specify the light color with sliders. You can create your desired color by increasing and decreasing the slider values for the colors **Red**, **Green**, and **Blue**. You can also enter a descriptive string (e.g., lavender) in the **Color** field.

Active Lights

shows the position and color of all defined directional lights, and allows you to change the position of a light. All directional lights in ANSYS FLUENT are assumed to be at infinity and pass through the unit

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

sphere at the position shown. All light rays arriving at the scene from one light are parallel. The colored markers on the surface of the sphere represent the color and direction of these *distant* lights. These lights point towards the center of the sphere (the origin, which is usually where the geometry is).

Lighting Method

specifies the method to be used in lighting interpolation: **Off**, **Flat**, **Gouraud**, or **Phong**. (**Flat** is the most basic method: there is no interpolation within the individual polygonal facets. **Gouraud** and **Phong** have smoother gradations of color because they interpolate on each facet.) When **Off** is selected, lighting effects are disabled.

Headlight On

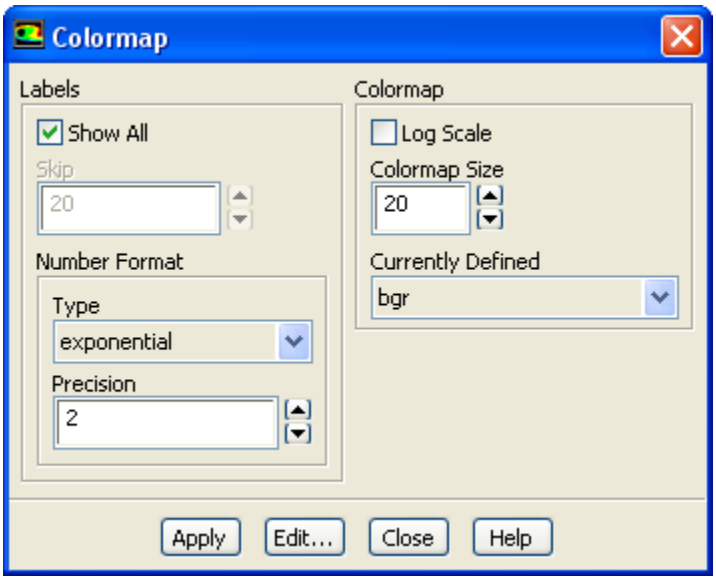
enables constant lighting effects in the direction of the view.

Reset

resets the light definitions to their last saved state (i.e., the lighting that was in effect the last time you opened the dialog box or clicked on **Apply**).

35.19.30. Colormap Dialog Box

The **Colormap** dialog box allows you to select and modify existing colormaps. See *Selecting a Colormap* (p. 1419) for details.



Controls

Labels

allows you to customize the display of your colormap labels.

Show All

Enable this option if you want all the labels to show alongside the colormap. Disable if you want to skip some of the label displays.

Skip

sets the number of labels to be skipped.

Number Format

contains controls for changing the format of the labels on the color scale. These labels are the character strings used to define the color divisions at the left of the graphics window.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Type
sets the form of the labels. You may select from a drop-down list of options, including the following:

general
displays the real value with either float or exponential form based on the size of the number and the defined **Precision**.

float
displays the real value with an integral and fractional part (e.g., 1.0000), where the number of digits in the fractional part is determined by **Precision**.

exponential
displays the real value with a mantissa and exponent (e.g., 1.0e-02), where the number of digits in the fractional part of the mantissa is determined by **Precision**.

Precision
defines the number of fractional digits displayed in the labels.

Colormap
contains controls for the colormap size and scale, and for selection of a defined colormap.

Log Scale
enables the use of a logarithmic scale for the color scale (rather than the default decimal scale). See *Specifying the Colormap Size and Scale* (p. 1419) for details.

Colormap Size
specifies the number of distinct colors in the colormap. You may specify from 2 to 100 colors.

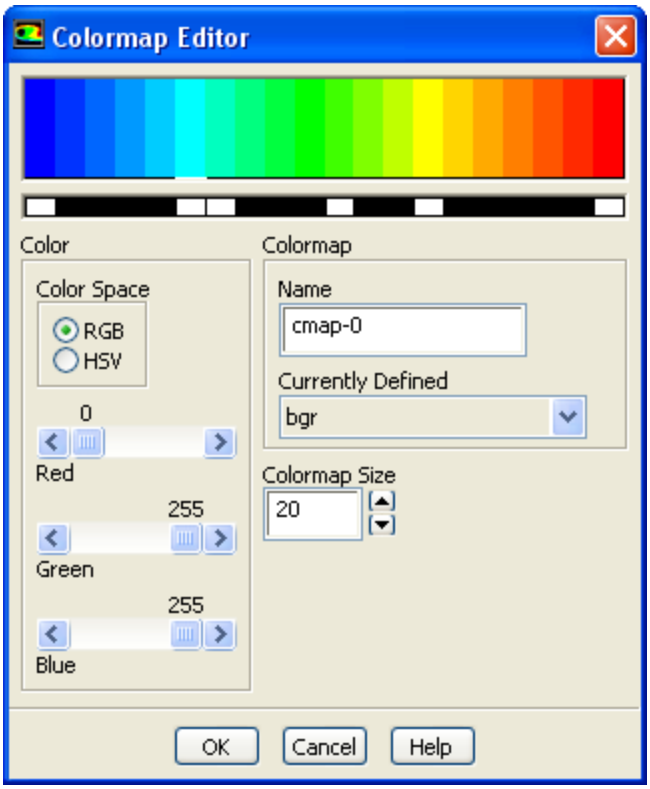
Currently Defined
contains a drop-down list of all pre-defined colormaps and all custom colormaps defined by you. Select the colormap to be used from this list.

Edit...
opens the *Colormap Editor Dialog Box* (p. 2008), in which you can create a custom colormap.

35.19.31. Colormap Editor Dialog Box

The **Colormap Editor** dialog box allows you to create custom colormaps. See *Creating a Customized Colormap* (p. 1421) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

(The Drawing Area)
is used to interactively modify colormaps. You can use the notion of anchor points to interpolate linearly between two defined anchor points. The colors at the top of the dialog box allow you to preview the colormap that is being defined, The black bar and white squares below the colors allow you to set, delete, and modify anchor points.

Color
specifies color components for the currently selected anchor point.

Color Space
gives you a choice of selecting the color specification.

RGB
enables the specification of colors based on their red, green, and blue components.

HSV
enables the specification of colors based on their hue, saturation, and value.

Red, Green, Blue
are scales with which you can specify the RGB components of the selected anchor color. These scales will appear when **RGB** is selected.

Hue, Saturation, Value
are scales with which you can specify the HSV components of the selected anchor color. These scales will appear when **HSV** is selected.

Colormap
lists colormap names and the name of the colormap being edited.

Name
sets the name of the colormap being edited/selected. You can rename existing colormaps and provide names for new colormaps.

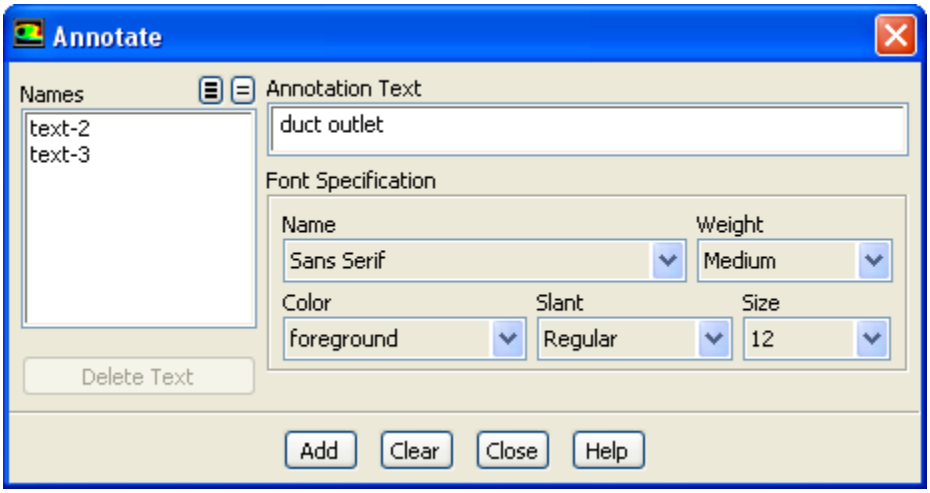
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Currently Defined
contains a drop-down list of all pre-defined colormaps and all custom colormaps defined by you. You can select a colormap to be modified from this list.

Colormap Size
specifies the number of distinct colors in the colormap. You may specify from 2 to 100 colors.

35.19.32. Annotate Dialog Box

You can use the **Annotate** dialog box to add text with optional attachment lines to the graphics windows, or to modify existing text. See *Adding Text Using the Annotate Dialog Box* (p. 1415) for details about the items below.



Controls

Names
contains a selectable list of all annotation text strings that have been defined. You can choose a text string to be deleted or edited.

Delete Text
deletes the text strings selected in the **Names** list from the display.

Annotation Text
contains the annotation text string you wish to add, or the annotation text string for the item selected in the **Names** list.

Font Specification
contains controls for defining or modifying the font in the annotation text string.

Name
contains a drop-down list of various font styles.

Weight
contains a drop-down list from which you can select **Medium** or **Bold**.

Color
contains a drop-down list of colors that can be used for the text.

Slant
contains a drop-down list from which you can select **Regular** or **Italic** as the slant type.

Size
contains a drop-down list of font sizes (in points).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Add

adds the current **Annotation Text** to the active graphics window. A dialog box will prompt you to select a screen location using the mouse-probe button on your mouse (see *Controlling the Mouse Button Functions* (p. 1427) for more information on setting the mouse buttons).

Edit

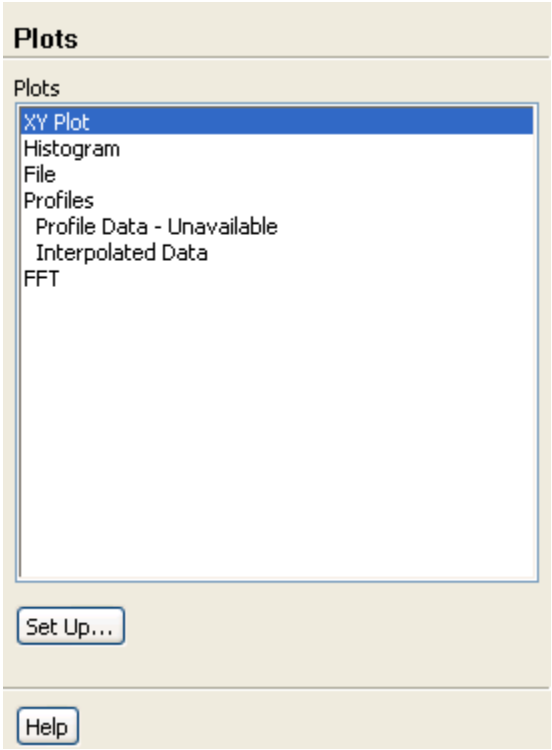
updates the edited text in the active graphics window. This button will replace the **Add** button when you are editing an existing text string from the **Names** list.

Clear

removes all annotation text and attachment lines from the active graphics window.

35.20. Plots Task Page

The **Plots** task page allows you to create plots (XY, histograms, profiles, etc.) of your computational results. See *Displaying Graphics* (p. 1379) for more information.



Controls

Plots

contains a listing of the various plot types available in ANSYS FLUENT.

You can double-click an item in the **Plots** list to open the corresponding dialog box, or you can select the item in the list and click the **Set Up...** button.

XY Plot

selecting this item and clicking the **Set Up...** button opens the *Solution XY Plot Dialog Box* (p. 2012).

Histogram

selecting this item and clicking the **Set Up...** button opens the *Histogram Dialog Box* (p. 2015).

File

selecting this item and clicking the **Set Up...** button opens the *File XY Plot Dialog Box* (p. 2016).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Profiles

two types of profile plots are available:

Profile Data

selecting this item and clicking the **Set Up...** button opens the *Plot Profile Data Dialog Box* (p. 2017).

Interpolated Data

selecting this item and clicking the **Set Up...** button opens the *Plot Interpolated Data Dialog Box* (p. 2018).

FFT

selecting this item and clicking the **Set Up...** button opens the *Fourier Transform Dialog Box* (p. 2019).

Set Up...

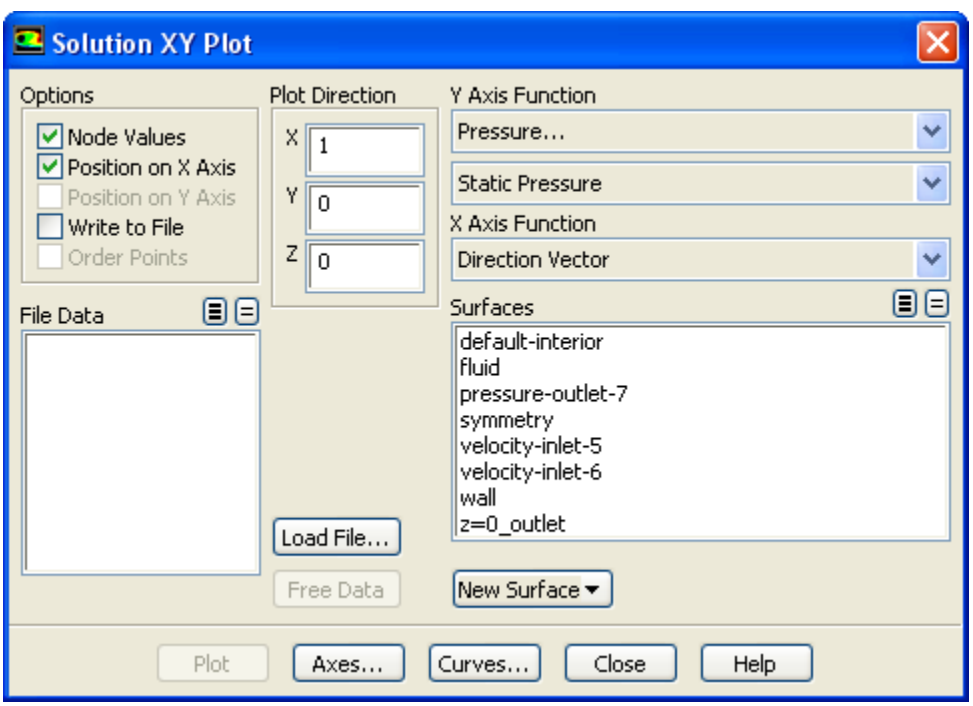
displays the dialog box corresponding to the selected item in the **Plots** list.

For additional information, please see the following sections:

35.20.1. Solution XY Plot Dialog Box
35.20.2. Histogram Dialog Box
35.20.3. File XY Plot Dialog Box
35.20.4. Plot Profile Data Dialog Box
35.20.5. Plot Interpolated Data Dialog Box
35.20.6. Fourier Transform Dialog Box
35.20.7. Plot/Modify Input Signal Dialog Box
35.20.8. Axes Dialog Box
35.20.9. Curves Dialog Box

35.20.1. Solution XY Plot Dialog Box

The **Solution XY Plot** dialog box allows you to display zone, surface and file data in an XY plot format. See *Steps for Generating Solution XY Plots* (p. 1468) for details about the items below.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

contains check buttons that control the presentation of node or cell-averaged values, the selection of axis functions, and the ability to write the plot data to a file.

Node Values

toggles the node averaging of the data presented in the plot. If the option is inactive, cell values are presented. See *Choosing Node or Cell Values* (p. 1472) for details.

Position on X Axis, Position on Y Axis

set the x-axis or y-axis function to be the position. If one of these options is turned on, the other will automatically be turned off. You can turn both options off to generate a plot of one flow-field function vs. another, selecting the function for each axis using the **X Axis Function** and **Y Axis Function** drop-down lists.

Write to File

activates the file-writing option. When this option is selected, the **Plot** push button will change to **Write...**. Clicking on the **Write...** button will open the **Select File** dialog box (*The **Select File** Dialog Box* (p. 33) and *The **Select File** Dialog Box (Windows)* (p. 33)), in which you can specify a name and save a file containing the plot data. The format of this file is described in *XY Plot File Format* (p. 1477).

Order Points

specifies that plot data being saved to a file should be sorted in order of ascending x axis value. This option is available only when the **Write to File** option is turned on.

Plot Direction

contains inputs for defining the plot direction.

If **Direction Vector** (the default) is selected in the **X Axis Function** or **Y Axis Function** drop-down list (whichever is the position axis), the inputs are the components of the direction vector. The position axis of the plot will have coordinate values that correspond to the dot product of the data coordinate vector with the plot direction vector. See *Steps for Generating Solution XY Plots* (p. 1468) for details.

X

is the component in the x direction.

Y

is the component in the y direction.

Z

is the component in the z direction.

If **Curve Length** is selected in the **X Axis Function** or **Y Axis Function** drop-down list (whichever is the position axis), the inputs are the direction along the length of the surface selected in the **Surfaces** list. See *Steps for Generating Solution XY Plots* (p. 1468) for details.

Default

specifies the plot direction as the direction of increasing curve length.

Reverse

specifies the plot direction as the direction of decreasing curve length.

Show

displays the selected surface in the graphics window, marking the start of the surface with a blue dot and the end of the surface with a red dot. ANSYS FLUENT will also display arrows on the surface showing the direction in which the variable will be plotted.

Y Axis Function, X Axis Function

contain lists of solution variables that can be used for the y or x axis of the plot. If the **Position on X Axis** option is turned on, **X Axis Function** will become a single drop-down list, containing two options:

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Direction Vector (to plot the selected variable as a function of position along a specified direction vector) and **Curve Length** (to plot the selected variable as a function of position along the length of a specified curvilinear surface). See *Steps for Generating Solution XY Plots* (p. 1468) for details.

Likewise, if **Position on Y Axis** is turned on, **Y Axis Function** will become a single drop-down list containing **Direction Vector** and **Curve Length**. If both **Position on X Axis** and **Position on Y Axis** are turned off, you can select field functions for both axes using the **X Axis Function** and **Y Axis Function** lists.

File Data
is a selectable list of the plot titles associated with the loaded external data files. You may choose any number of files for the data plot. The files are loaded using the **Load File...** push button. The format of these files is presented in *XY Plot File Format* (p. 1477). See *Including External Data in the Solution XY Plot* (p. 1472) for details.

Load File...
opens the **Select File** dialog box (*The **Select File** Dialog Box* (p. 33)), in which you can select the plot file to be read. See *Including External Data in the Solution XY Plot* (p. 1472) for details. After the external file is loaded, its plot title will be displayed in the **File Data** list.

Free Data
removes the files selected in the **File Data** list.

Surfaces
is a selectable list of surfaces in the solution domain. You may choose any number of surfaces for the data plot.

New Surface
is a drop-down list button that contains a list of surface options:

Point
opens the *Point Surface Dialog Box* (p. 1927).

Line/Rake
opens the *Line/Rake Surface Dialog Box* (p. 1928).

Plane
opens the *Plane Surface Dialog Box* (p. 1929).

Quadric
opens the *Quadric Surface Dialog Box* (p. 1931).

Iso-Surface
opens the *Iso-Surface Dialog Box* (p. 1933).

Iso-Clip
opens the *Iso-Clip Dialog Box* (p. 1935).

Plot
plots the specified surface and/or file data in the active graphics window using the current axis and curve attributes. If the **Write to File** option is turned on, this button becomes the **Write...** button.

Write...
opens the **Select File** dialog box (*The **Select File** Dialog Box* (p. 33)), in which you can save the plot data to a file. This button replaces the **Plot** button when the **Write to File** option is turned on.

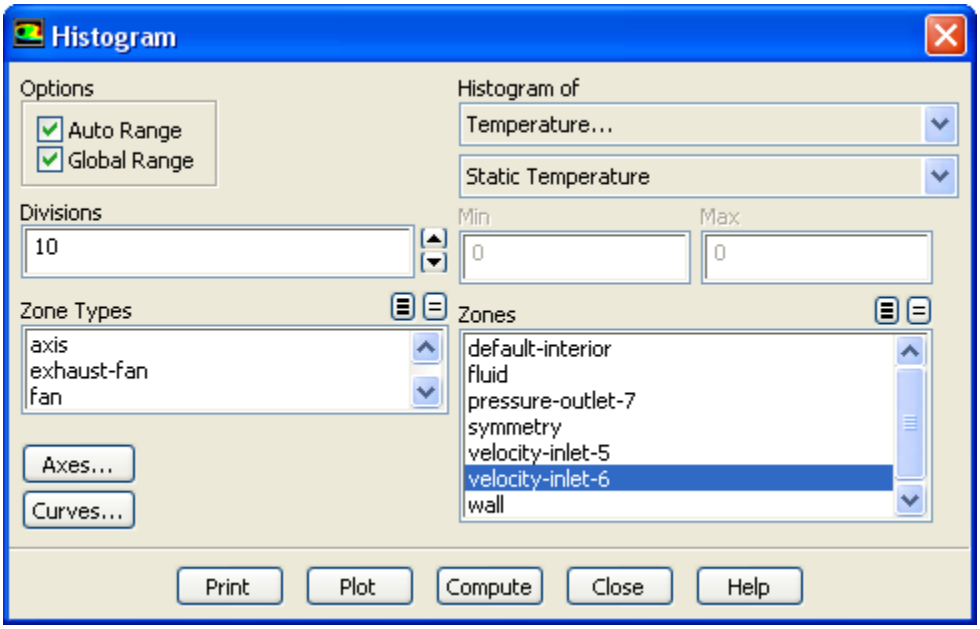
Axes...
opens the *Axes Dialog Box* (p. 2022), which allows you to customize the plot axes.

Curves...
opens the *Curves Dialog Box* (p. 2024), which allows you to customize the curves used in the XY plot.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.20.2. Histogram Dialog Box

The **Histogram** dialog box allows you to create histograms of selected geometric or physical data. See *Steps for Generating Histogram Plots* (p. 1478) for details about the items below.



Controls

Options

contains the check buttons for current histogram options.

Auto Range

toggles the ability to specify the minimum and maximum range of scalar values in the histogram print or plot. If the option is not active, the **Min** and **Max** fields are editable, and you may specify the desired range. If the option is active, the range is defined by the minimum and maximum values in the computational domain.

Global Range

toggles the ability to specify the minimum and maximum values on the range of values on the selected surfaces, rather than in the entire domain.

Divisions

sets the number of data intervals that will exist in the histogram.

Zone Types

contains a list of available face or cell zone types.

Axes...

opens the *Axes Dialog Box* (p. 2022), which allows you to customize the plot axes.

Curves...

opens the *Curves Dialog Box* (p. 2024), which allows you to customize the curves used in the histogram plot.

Histogram of

contains a list of scalar quantities that can be used in the histogram.

Min

displays or allows definition of the minimum value of the selected scalar quantity used in the histogram.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Max
displays or allows definition of the maximum value of the selected scalar quantity used in the histogram.

Zones
contains a list of available face or cell zones.

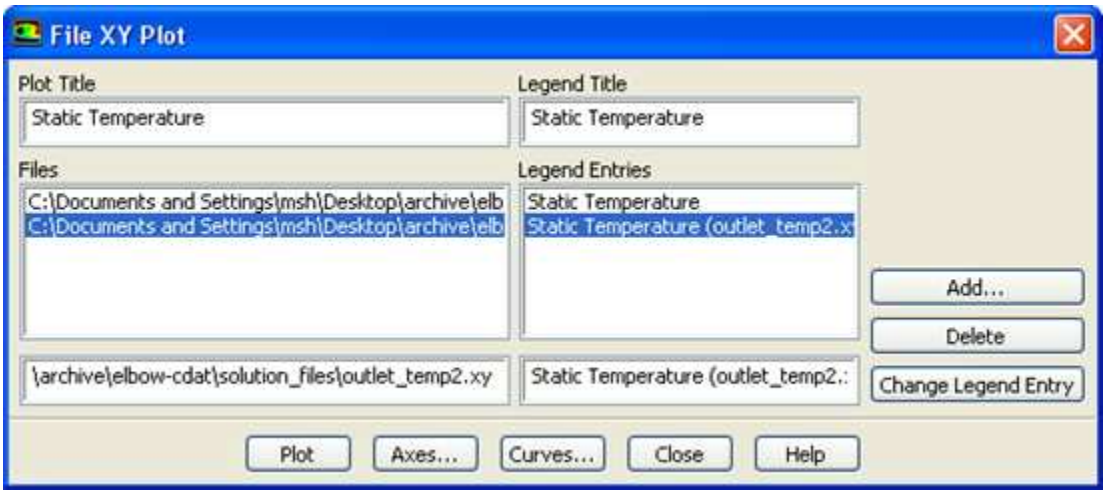
Print
displays the histogram interval.

Plot
displays a plot of the percentage of the total number of cells versus the scalar quantity in the active graphics window.

Compute
computes the minimum and maximum cell values of the selected scalar quantity. The values are displayed in **Min** and **Max**.

35.20.3. File XY Plot Dialog Box

The **File XY Plot** dialog box allows you to display data read from one or more files in an abscissa/ordinate plot form. The format of the plot file is described in *XY Plot File Format* (p. 1477). See *Steps for Generating XY Plots of Data in External Files* (p. 1472) for details about the items below.



Controls

Plot Title
displays the current plot title. The default plot title is the y-axis label of the first file read into the dialog box, but you can edit the text entry to change the plot title.

Files
contains a selectable list of loaded file names. If you enter a valid file name into the text entry field below the list and press the **Add...** button ANSYS FLUENT will load the file and update the dialog box. If, however, the file is not found or has already been read, the *The **Select File** Dialog Box* (p. 33) will be opened.

Legend Title
sets the title of the legend. By default, the legend has no title.

Legend Entries
contains a selectable list of legend labels associated with the loaded files. The default legend label is the title (first string) in the file. You can modify the legend label by selecting the old name in the **Legend Entries** list. It is then displayed in the text entry field below the list and may be edited.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Add...
loads the file named in the **Files** text entry field or opens the **Select File** dialog box if no name, a wrong name, or a duplicate name appears in that text field.

Delete
removes the file selected in the **Files** list.

Change Legend Entry
changes the legend label of the selected file to the text entered in the text entry field below the **Legend Entries** list.

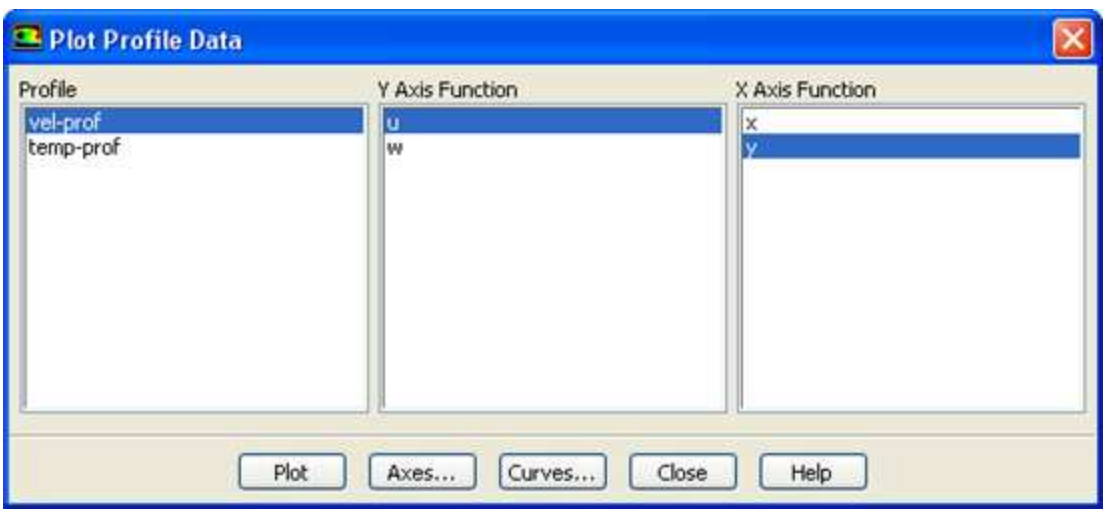
Plot
displays an XY plot of the data associated with every loaded file. You can use the **Delete** button to remove files that you do not wish to plot.

Axes...
opens the *Axes Dialog Box* (p. 2022), which allows you to customize the plot axes.

Curves...
opens the *Curves Dialog Box* (p. 2024), which allows you to customize the curves used in the XY plot.

35.20.4. Plot Profile Data Dialog Box

The **Plot Profile Data** dialog box allows you to display an XY plot of the original data points of a boundary profile before it is interpolated onto the cell faces of a boundary. See *Steps for Generating Plots of Profile Data* (p. 1474) for details about the items below.



Controls

Profile
contains a selectable list of available profiles. When a profile is selected its available fields are displayed under **Y Axis Function**.

Y Axis Function
contains a selectable list of the fields available in the selected profile that can be used for the y axis of the plot.

X Axis Function
contains a selectable list of the variables that can be used for the x axis of the plot.

Plot
displays an XY plot of the data points from the selected profile.

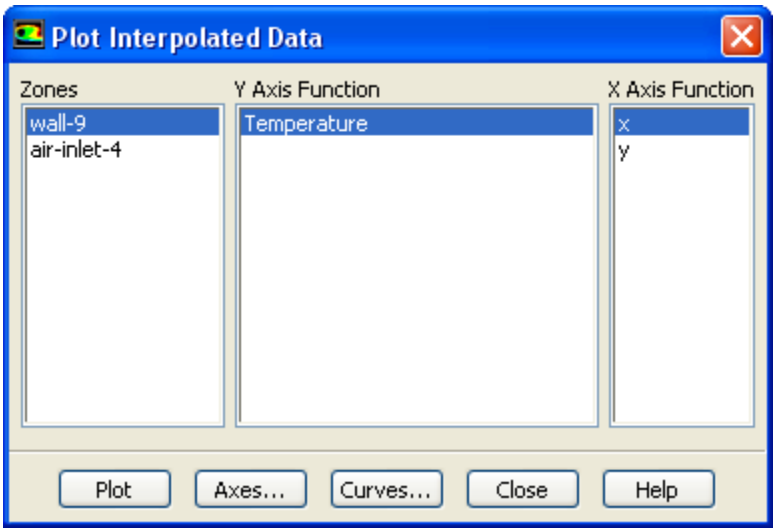
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Axes...
opens the *Axes Dialog Box* (p. 2022), which allows you to customize the plot axes.

Curves...
opens the *Curves Dialog Box* (p. 2024), which allows you to customize the curves used in the XY plot.

35.20.5. Plot Interpolated Data Dialog Box

The **Plot Interpolated Data** dialog box allows you to display an XY plot of the values assigned to the cell faces when a profile file has been interpolated on a boundary. See *Steps for Generating Plots of Interpolated Profile Data* (p. 1475) for details about the items below.



Controls

Zones
contains a selectable list of the zones for which a profile field has been set as one or more of the parameters are displayed under **Y Axis Function**.

Y Axis Function
contains a selectable list of the profile-related parameters in the selected zone that can be used for the y axis of the plot. The name of the parameter will be the same as that of the drop-down list in the boundary condition dialog box from which the profile field was selected.

X Axis Function
contains a selectable list of the geometry variables that can be used for the x axis of the plot.

Plot
displays an XY plot of the cell face values (as interpolated from the data points of the profile file) of the selected zone.

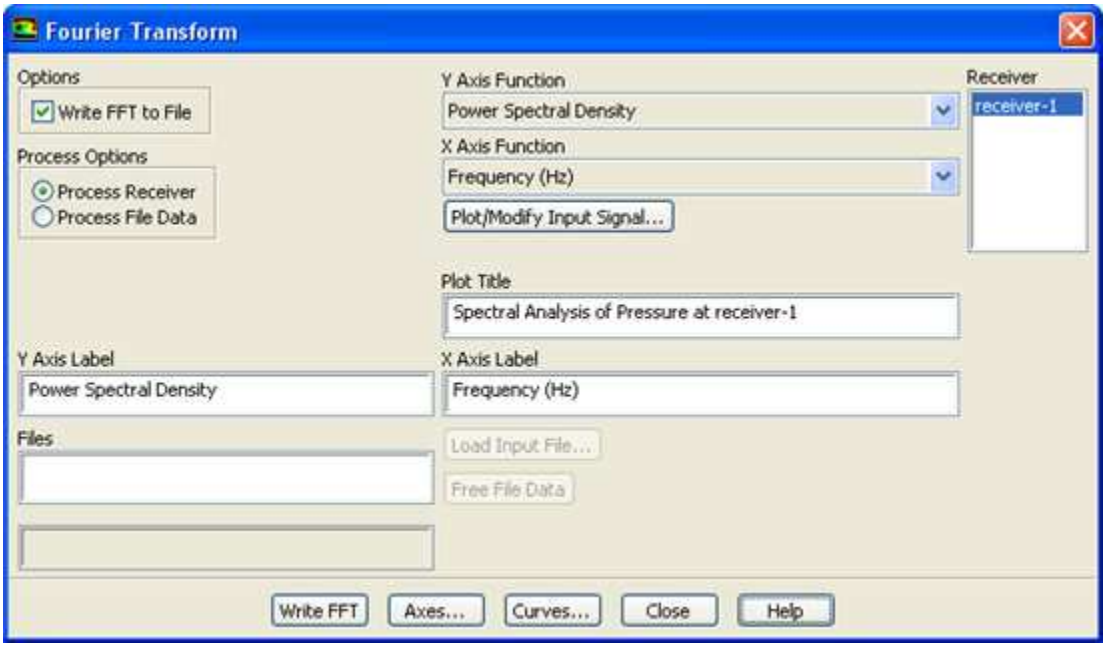
Axes...
opens the *Axes Dialog Box* (p. 2022), which allows you to customize the plot axes.

Curves...
opens the *Curves Dialog Box* (p. 2024), which allows you to customize the curves used in the XY plot.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.20.6. Fourier Transform Dialog Box

The **Fourier Transform** dialog box allows you to analyze your time dependent data using the Fast Fourier Transform (FFT) algorithm. See *Fast Fourier Transform (FFT) Postprocessing* (p. 1500) for details about the items below.



Controls

Options

lets you write the FFT data to a file or display the FFT data in a graphics window.

Write FFT to File

allows you to write out the FFT data directly to a file. When selected, the **Plot FFT...** buttons becomes the **Write FFT...** button.

Process Options

contains options to analyze signal data.

Process Receiver

allows you to analyze receiver data stored in memory.

Process File Data

allows you to analyze signal data from an existing input file.

Y Axis Function

contains a list from which you can select the function for the y axis.

X Axis Function

contains a list from which you can select the function for the x axis.

Receiver

contains a list of receivers from which you can select when the **Process Receiver** option is enabled.

Plot/Modify Input Signal...

opens the *Plot/Modify Input Signal Dialog Box* (p. 2020), in which you can set additional options for vector displays.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Plot Title
lets you create a new title or edit the original title for the FFT plot. By default, ANSYS FLUENT adds the string "Spectral Analysis of" to the title originally applied to the input signal plot.

Y-axis Label
allows you to create a new y axis label or edit the original y axis label. By default, the **Y-axis Label** corresponds to the selection in the **Y Axis Function** drop-down list.

X-axis Label
allows you to create a new x axis label or edit the original x axis label. By default, the **X-axis Label** corresponds to the selection in the **X Axis Function** drop-down list.

Files
lists the loaded input signal data files.

Load Input File...
loads an input signal data file into ANSYS FLUENT for FFT analysis. The input file is listed under **Files**.

Free File Data
removes data from FFT analysis once the input signal data file is selected in the **Files** list.

Plot FFT
displays the FFT data in a graphic window. If the **Write FFT to File** option is selected, then this button becomes the **Write FFT** button, which opens a file selection dialog box so that you write the FFT data to a file.

Write FFT
opens *The **Select File** Dialog Box* (p. 33) in which you can specify a name and save the FFT data to a file. If the **Write FFT to File** option is selected, then the **Plot FFT** button changes to the **Write FFT** button.

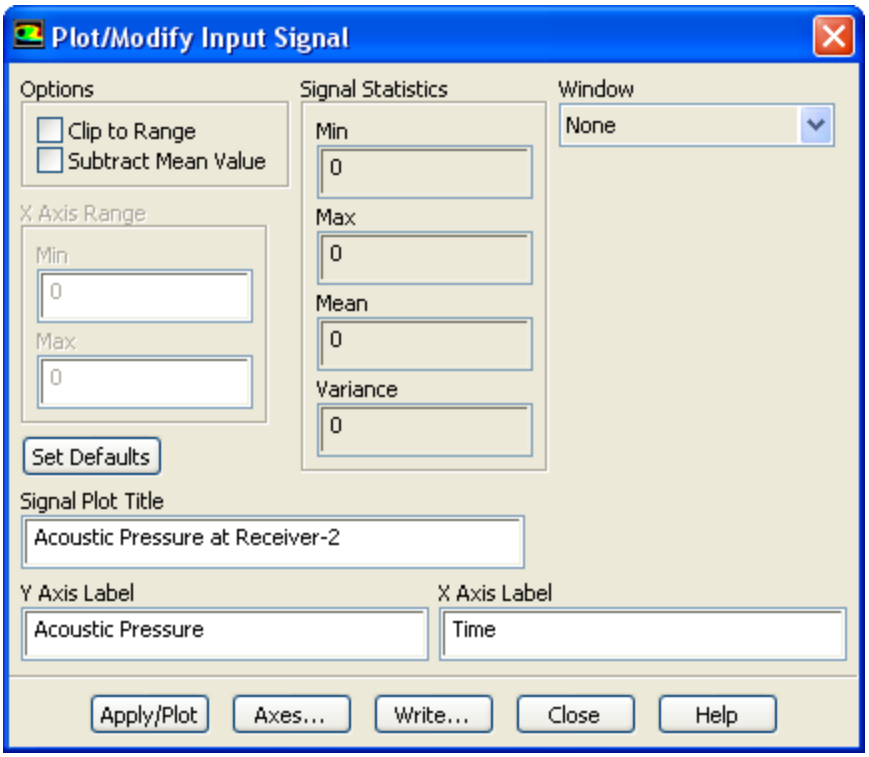
Axes...
opens the *Axes Dialog Box* (p. 2022), which allows you to customize the plot axes.

Curves...
opens the *Curves Dialog Box* (p. 2024), which allows you to customize the curves used in the plot.

35.20.7. Plot/Modify Input Signal Dialog Box

The **Plot/Modify Input Signal** dialog box allows you to customize the input signal data set. It is opened from the *Fourier Transform Dialog Box* (p. 2019). See *Using the FFT Utility* (p. 1503) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

allows you to process some or all of the input signal data.

Clip to Range

allows you to analyze a portion of the input signal by specifying data range.

Subtract Mean Value

reduces y axis quantities by the mean value of the relevant signal property.

Signal Statistics

displays signal information.

Min

displays the minimum value for the input signal.

Max

displays the maximum value for the input signal.

Mean

displays the average value for the input signal.

Variance

displays the variance for the input signal.

X Axis Range

allows for a portion of the input signal to be analyzed when the **Process the whole data** option is turned off.

Min

specifies a minimum value for the x axis.

Max

specifies a maximum value for the x axis.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Set Defaults
resets the x axis minimum and maximum values to their original value and turns on the **Process the whole data** option.

Signal Plot Title
lets you create a new title or edit the original title for the input signal plot. By default, the **Signal Plot Title** corresponds with the title originally applied to the input signal plot.

Y Axis Label
allows you to create a new y axis label or edit the original y axis label. By default, the **Y-axis Label** corresponds with the y axis label originally applied to the input signal plot.

X Axis Label
allows you to create a new x axis label or edit the original x axis label. By default, the **X-axis Label** corresponds with the x axis label originally applied to the input signal plot.

Window
lets you specify a windowing technique to remove discontinuities in the FFT calculation.

None
applies no windowing technique. This is the default setting.

Hamming
applies the Hamming technique.

Hanning
applies the Hanning technique.

Barlett
applies the Barlett technique.

Blackman
applies the Blackman technique.

Apply/Plot
applies any changes you have made in the dialog box and displays the input signal data in a graphics window.

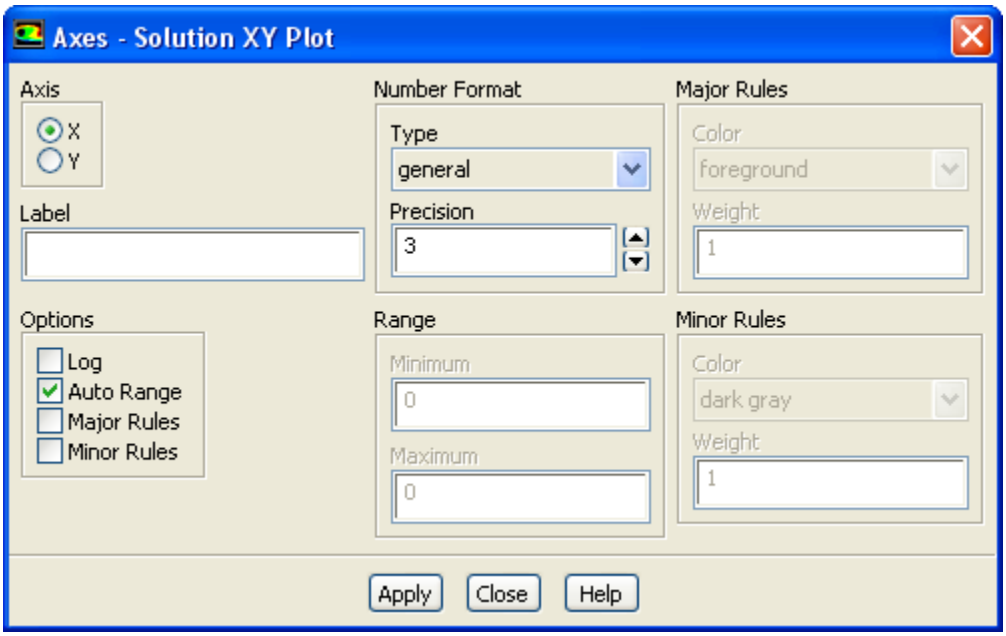
Axes...
opens the *Axes Dialog Box* (p. 2022), which allows you to customize the plot axes.

Write...
opens *The **Select File** Dialog Box* (p. 33), in which you can save the signals to a file.

35.20.8. Axes Dialog Box

The **Axes** dialog box allows you to independently control the characteristics of the ordinate and abscissa on an XY plot or histogram. You can change the labels, scale, range, number format, and major and minor rules visibility and appearance. Note that the title following **Axes** in the dialog box indicates which plot environment you are changing. You can set different parameters for each type of plot that ANSYS FLUENT can generate. See *Using the Axes Dialog Box* (p. 1480) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Axis

contains check buttons that allow you to set abscissa (x-axis) or ordinate (y-axis) characteristics.

X

allows you to specify the abscissa characteristics.

Y

allows you to specify the ordinate characteristics.

Label

defines the character string that will label the active axis (the one selected in **Axis**) in the display.

Options

contains check buttons that (de)activate scale, range, major rules, and minor rules.

Log

toggles logarithmic scaling of the active axis. By default, decimal scaling is used.

Auto Range

toggles automatic computation of the range of the active axis. If you deactivate this option, you may input the **Minimum** and **Maximum** values in the **Range** box.

Major Rules

toggles the display of major rules on the active axis. Major rules are the horizontal or vertical lines that mark the primary data divisions and span the whole plot window to produce a "grid."

Minor Rules

toggles the display of minor rules on the active axis. Minor rules are the horizontal or vertical lines that mark the secondary data divisions and span the whole plot window to produce a "grid."

Number Format

contains controls for changing the format of the data labels on the active axis. Data labels are the character strings used to define the primary data divisions on the axes.

Type

sets the form of the data labels. You may select from a drop-down list of options, including the following:

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

general
displays the real value with either float or exponential form based on the size of the number and the defined **Precision**.

float
displays the real value with an integral and fractional part (e.g., 1.0000), where the number of digits in the fractional part is determined by **Precision**.

exponential
displays the real value with a mantissa and exponent (e.g., 1.0e-02), where the number of digits in the fractional part of the mantissa is determined by **Precision**.

Precision
defines the number of fractional digits displayed in the data labels.

Range
contains the range or extents of the active axis. To set the range manually, you must turn off **Auto Range**. Otherwise the extents are computed automatically.

Minimum
sets the minimum data value for the active axis.

Maximum
sets the maximum data value for the active axis.

Major Rules
contains controls for modifying the appearance of the major rules. To use these controls you must activate **Major Rules** in the **Options** list.

Color
sets the color of the major rules from a drop-down list with numerous color selections.

Weight
sets the line thickness of the major rule. A line of weight 1.0 is normally 1 pixel wide. A weight of 2.0 would make the line twice as thick (i.e., 2 pixels wide).

Minor Rules
contains controls for modifying the appearance of the minor rules. To use these controls you must activate **Minor Rules** in the **Options** list.

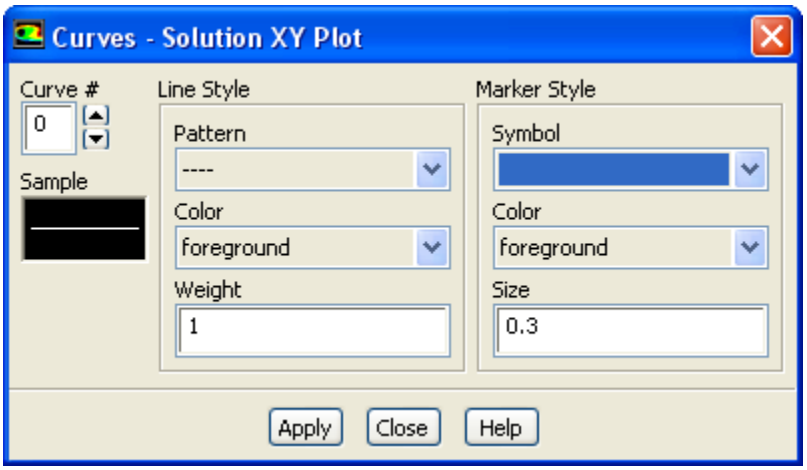
Color
sets the color of the minor rules from a drop-down list with numerous color selections.

Weight
sets the line thickness of the minor rule. A line of weight 1.0 is 1 pixel wide. A weight of 2.0 would make the line twice as thick (i.e., 2 pixels wide).

35.20.9. Curves Dialog Box

The **Curves** dialog box allows you to modify the appearance of the lines and markers used in XY plots. Note that the title following **Curves** in the dialog box indicates which plot environment you are changing. You can set different parameters for each type of plot that ANSYS FLUENT can generate. See *Using the Curves Dialog Box* (p. 1482) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Curve #

defines the active curve number. The present and future marker and line styles apply to the defined curve number. The curves are numbered sequentially, starting from 0. For example, if you were plotting flow-field values on two zones, the first zone would be curve 0, and the second, curve 1. If the plot contains only one curve, the **Curve #** is set to 0 and is not editable.

Sample

displays a single marker and line with the current style attributes.

Line Style

contains controls for modifying the appearance of the active curve.

Pattern

sets the pattern of the active curve. A drop-down list allows you to set the line pattern. Except for **center** and **phantom** lines, the list displays examples of the pattern choices. A **center**line alternates a very long dash and a short dash and a **phantom** line alternates a very long dash and a double short dash.

Color

sets the color of the active curve. A drop-down list allows you to select from a list of color names.

Weight

sets the thickness of the active curve. A line weight of 1.0 is normally 1 pixel wide. Therefore, a weight of 2.0 would make the line twice as thick (i.e., 2 pixels wide).

Marker Style

contains controls for modifying the appearance of the active curve's marker.

Symbol

sets the symbol used to mark data. You can select the symbol from a drop-down list that contains all the symbol choices. The **Sample** box will allow you to experiment with various markers. For example, in plotting pressure-coefficient data on the upper and lower surfaces of an airfoil, the symbol `/*\` (filled-in upward-pointing triangle) could be used for the marker representing the upper surface data, and the symbol `\*/` (filled-in downward-pointing triangle) could be used for the marker representing the lower surface data.

Color

sets the color of the marker on the active line number. A drop-down list allows you to select from a list of color names.

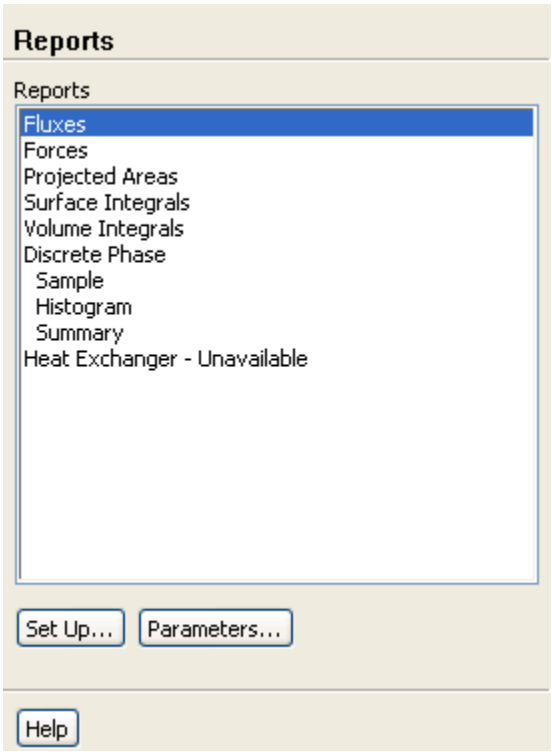
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Size

sets the size of the data marker. A symbol of size 1.0 is 3.0% of the height of the display screen, except for the "." symbol, which is always one pixel.

35.21. Reports Task Page

The **Reports** task page allows you to set up reports for your CFD simulation. Reports can be compiled for fluxes, forces, projected areas, surface and volume integrals, among others. See *Reporting Alphanumeric Data* (p. 1509) for more information.



Controls

Reports

displays a list of available report types in ANSYS FLUENT.

You can double-click an item in the **Reports** list to open the corresponding dialog box, or you can select the item in the list and click the **Set Up...** button.

Fluxes

selecting this item and clicking the **Set Up...** button opens the *Flux Reports Dialog Box* (p. 2027).

Forces

selecting this item and clicking the **Set Up...** button opens the *Force Reports Dialog Box* (p. 2029).

Projected Areas

selecting this item and clicking the **Set Up...** button opens the *Projected Surface Areas Dialog Box* (p. 2030).

Surface Integrals

selecting this item and clicking the **Set Up...** button opens the *Surface Integrals Dialog Box* (p. 2031).

Volume Integrals

selecting this item and clicking the **Set Up...** button opens the *Volume Integrals Dialog Box* (p. 2034).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discrete Phase
allows you to report on one of the following three report types:

Sample
selecting this item and clicking the **Set Up...** button opens the *Sample Trajectories Dialog Box* (p. 2036).

Histogram
selecting this item and clicking the **Set Up...** button opens the *Trajectory Sample Histograms Dialog Box* (p. 2038).

Summary
selecting this item and clicking the **Set Up...** button opens the *Particle Summary Dialog Box* (p. 2039).

Heat Exchanger
selecting this item and clicking the **Set Up...** button opens the *Heat Exchanger Report Dialog Box* (p. 2040).

Set Up...
opens the dialog box corresponding to the selected item in the **Reports** list.

Parameters...
opens the *Parameters Dialog Box* (p. 2041).

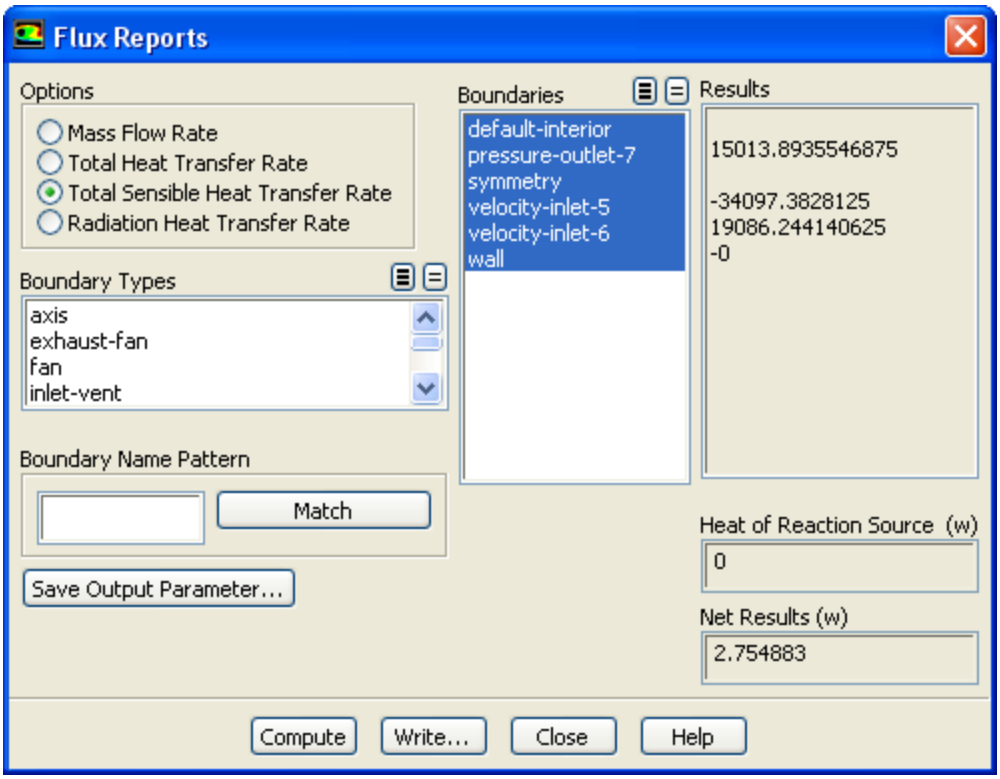
For additional information, please see the following sections:

35.21.1. Flux Reports Dialog Box
35.21.2. Force Reports Dialog Box
35.21.3. Projected Surface Areas Dialog Box
35.21.4. Surface Integrals Dialog Box
35.21.5. Volume Integrals Dialog Box
35.21.6. Sample Trajectories Dialog Box
35.21.7. Trajectory Sample Histograms Dialog Box
35.21.8. Particle Summary Dialog Box
35.21.9. Heat Exchanger Report Dialog Box
35.21.10. Parameters Dialog Box
35.21.11. Rename Dialog Box
35.21.12. Input Parameter Properties Dialog Box
35.21.13. Save Output Parameter Dialog Box

35.21.1. Flux Reports Dialog Box

The **Flux Reports** dialog box allows you to compute the mass flow rate, heat transfer rate, and radiation heat transfer rate on selected boundary zones. See *Fluxes Through Boundaries* (p. 1510) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains the following radio buttons:

Mass Flow Rate

turns on the computation of the mass flow rate for the selected boundary zones.

Total Heat Transfer Rate

turns on the computation of the total heat transfer rate for the selected boundary zones.

Total Sensible Heat Transfer Rate

turns on the computation of the total sensible heat transfer rate for the selected boundary zones. It reports the total energy flux as defined in Equation 5–2 in the Theory Guide.

Radiation Heat Transfer Rate

turns on the computation of the radiation heat transfer rate for the selected boundary zones.

Boundary Types

contains a selectable list of types of boundary zones. If you select (or deselect) an item in this list, all zones of that type will be selected (or deselected) automatically in the **Boundaries** list.

Boundary Name Pattern

specifies the pattern to look for in the names of boundary zones. Type the pattern in the text field and click **Match** to select (or deselect) the zones in the **Boundaries** list with names that match the specified pattern. See *Generating a Flux Report* (p. 1511) for information about matching additional characters using * and ?.

Save Output Parameter...

opens the *Save Output Parameter Dialog Box* (p. 2044).

Boundaries

contains a selectable list of valid boundary zones for flux reporting.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Results

displays the results of the selected flux computation for each boundary zone selected. The summation of the individual zone flux results is displayed in the box below the **Results** list.

Compute

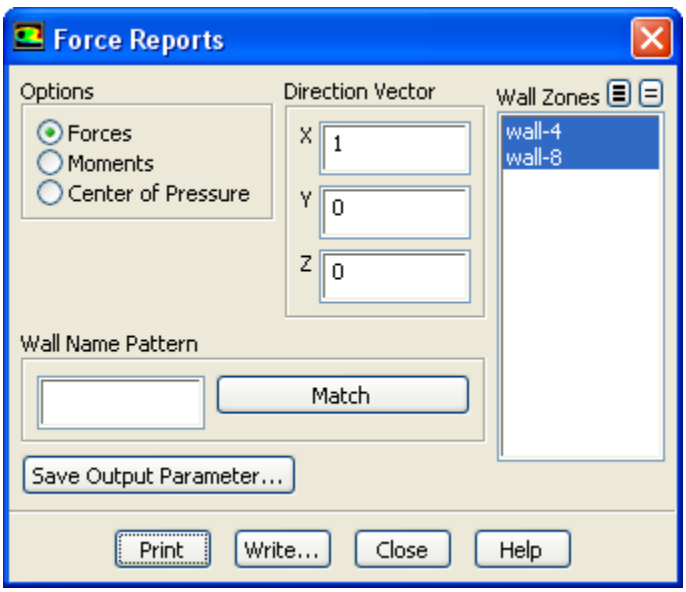
computes the flux for each of the selected boundary zones and updates the **Heat of Reaction Source** and **Net Results** (e.g., in kg/s, W, etc.).

Write...

opens the **Select File** dialog box (*The **Select File** Dialog Box* (p. 33) and *The **Select File** Dialog Box (Windows)* (p. 33)), which you can use to save the reported values to a file.

35.21.2. Force Reports Dialog Box

The **Force Reports** dialog box allows you to compute the forces along a specified vector, moments about a specified center, and the coordinates of the center of pressure for selected wall zones. See *Forces on Boundaries* (p. 1515) for details.



Controls

Options

contains radio buttons that control computation of the forces, moments, or center of pressure.

Forces

enables the computation of the pressure and viscous forces.

Moments

enables the computation of the pressure and viscous moments.

Center of Presure

enables the computation of the average location of the pressure.

Direction Vector

contains the components of the force vector. This label is visible when the **Forces** radio button is active.

X,Y,Z

are the components of the force vector along which the forces will be computed.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Moment Center
contains the Cartesian coordinates of the moment center. This label is visible when the **Moments** radio button is active.

X,Y,Z
are the Cartesian coordinates of the moment center about which moments will be computed.

Moment Axis
contains the Cartesian coordinates of the moment axis. This label is visible when the **Moments** radio button is active.

X,Y,Z
are the Cartesian coordinates of the moment axis about which moments will be computed.

Coordinate
contains the value of the Cartesian coordinate that is fixed. This label is visible when the **Center of Pressure** radio button is active.

X,Y,Z
are the Cartesian coordinates, one of which will be fixed.

Value (n)
is the point where the selected Cartesian coordinate will be fixed.

Wall Zones
contains a selectable list of wall zones. The force or moment information is printed for each zone, and then a total force or moment for all the zones is presented.

Wall Name Pattern
specifies the pattern to look for in the names of wall zones. Type the pattern in the text field and click **Match** to select (or deselect) the zones in the **Wall Zones** list with names that match the specified pattern. See *Generating a Force, Moment, or Center of Pressure Report* (p. 1515) for information about matching additional characters using * and ?.

Save Output Parameter...
opens the *Save Output Parameter Dialog Box* (p. 2044).

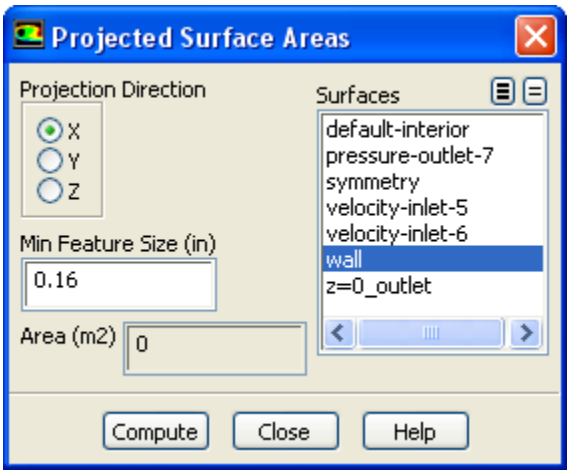
Print
displays (in the console) the pressure, viscous (if appropriate), and total forces or moments, and the pressure, viscous, and total force coefficients along the specified force vector or moment center for the selected wall zones. The center of pressure coordinates will print to the console when the **Center of Pressure** option is activated.

Write...
opens *The **Select File** Dialog Box* (p. 33), which you can use to save the reported values to a file.

35.21.3. Projected Surface Areas Dialog Box

The **Projected Surface Areas** dialog box allows you to compute an estimated area of the projection of selected surfaces along the x, y, or z axis. See *Projected Surface Area Calculations* (p. 1518) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Projection Direction
indicates the direction along which to project the surface.

Min Feature Size
specifies the length of the smallest feature in the geometry that you want to resolve in the area calculation.

Area
displays the computed projected area.

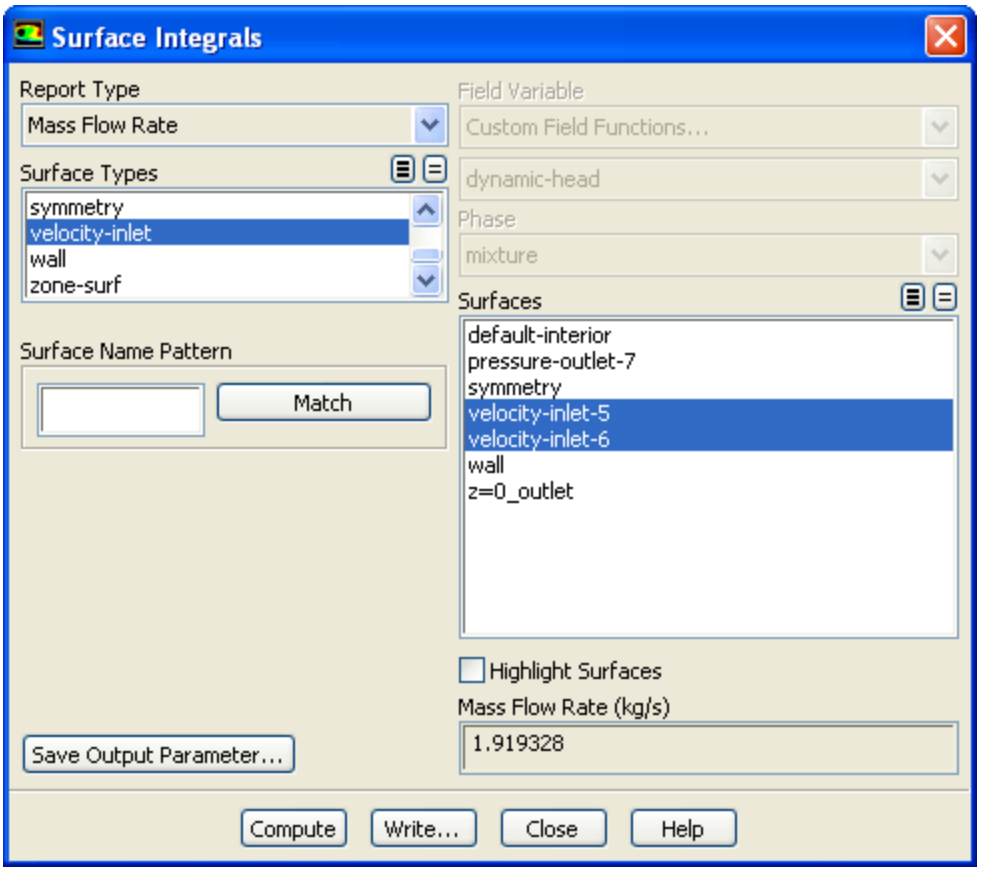
Surfaces
contains a list of existing surfaces. You can select the surface(s) for which the projected area is to be calculated in this list.

Compute
computes the area of the selected surfaces projected along the selected direction. The area will be printed in the **Area** box and in the console window.

35.21.4. Surface Integrals Dialog Box

The **Surface Integrals** dialog box allows you to compute the area, mass and volume flow rate, standard deviation, integral, flow rate, area-weighted average, mass-weighted average, sum, facet average, facet minimum/maximum, vertex average, or vertex minimum/maximum quantity of a specified field variable on a selected list of surfaces. See *Surface Integration* (p. 1519) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Report Type

contains drop-down list that has options that control the method of surface integration.

Area

turns on the computation of the surface area.

Area-Weighted Average

turns on the computation of the area-weighted average on the surface(s).

Facet Average

turns on the computation of the facet-averaged quantity on the surface(s).

Facet Minimum

turns on the computation of the facet minimum of a quantity on the surface(s).

Facet Maximum

turns on the computation of the facet maximum of a quantity on the surface(s).

Flow Rate

turns on the computation of the flow rate through the surface(s).

Integral

turns on the computation of the integral on the surface(s).

Mass Flow Rate

turns on the computation of the mass flow rate through the surface(s).

Mass-Weighted Average

turns on the computation of the mass-averaged quantity on the surface(s).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Standard Deviation
turns on the computation of the standard deviation of a specified field variable on a surface.

Sum
turns on the computation of the summed quantity on the surface(s).

Vertex Average
turns on the computation of the vertex-averaged quantity on the surface(s).

Vertex Minimum
turns on the computation of the vertex minimum of a quantity on the surface(s).

Vertex Maximum
turns on the computation of the vertex maximum of a quantity on the surface(s).

Volume Flow Rate
turns on the computation of the volume flow rate through the surface(s).

Surface Types
contains a selectable list of types of surfaces. If you select (or deselect) an item in this list, all surfaces of that type will be selected (or deselected) automatically in the **Surfaces** list.

Surface Name Pattern
specifies the pattern to look for in the names of surfaces. Type the pattern in the text field and click **Match** to select (or deselect) the zones in the **Surfaces** list with names that match the specified pattern. See *Generating a Surface Integral Report* (p. 1519) for information about matching additional characters using * and ?.

Field Variable
contains a list of the field variables that can be used in the surface integrations. This option is not active if the **Area**, **Mass Flow Rate**, or **Volume Flow Rate** option is active.

Surfaces
is a selectable list of surfaces.

Area
displays the result of the area summation over all the selected surfaces. This label is visible when **Area** is active.

Integral
displays the result of the integral computation over all the selected surfaces. This label is visible when **Integral** is active.

Standard Deviation
displays the result of the standard deviation computation over all the selected surfaces. This label is visible when **Standard Deviation** is active.

Flow Rate
displays the result of the flow rate computation over all the selected surfaces. This label is visible when **Flow Rate** is active.

Mass Flow Rate
displays the result of the mass flow rate computation over all the selected surfaces. This label is visible when **Mass Flow Rate** is active.

Volumetric Flow Rate
displays the result of the volumetric flow rate computation over all the selected surfaces. This label is visible when **Volume Flow Rate** is active.

Area-Weighted Average
displays the result of the area-weighted average computation over all the selected surfaces. This label is visible when **Area-Weighted Average** is active.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Mass-Weighted Average
displays the result of the mass-averaged computation over all the selected surfaces. This label is visible when **Mass-Weighted Average** is active.

Sum of Facet Values
displays the result of the summation over all the selected surfaces. This label is visible when **Sum** is active.

Average of Facet Values
displays the result of the facet-averaged computation over all the selected surfaces. This label is visible when **Facet Average** is active.

Minimum of Facet Values
displays the minimum facet value on all the selected surfaces. This label is visible when **Facet Minimum** is active.

Maximum of Facet Values
displays the maximum facet value on all the selected surfaces. This label is visible when **Facet Maximum** is active.

Average of Surface Vertex Values
displays the result of the vertex-averaged computation over all the selected surfaces. This label is visible when **Vertex Average** is active.

Minimum of Vertex Values
displays the minimum facet value on all the selected surfaces. This label is visible when **Vertex Minimum** is active.

Maximum of Vertex Values
displays the maximum facet value on all the selected surfaces. This label is visible when **Vertex Maximum** is active.

Highlight Surfaces
when enabled highlights the surfaces (selected in the **Surface Integrals** dialog box) in the graphics window.

Save Output Parameter...
opens the *Save Output Parameter Dialog Box* (p. 2044).

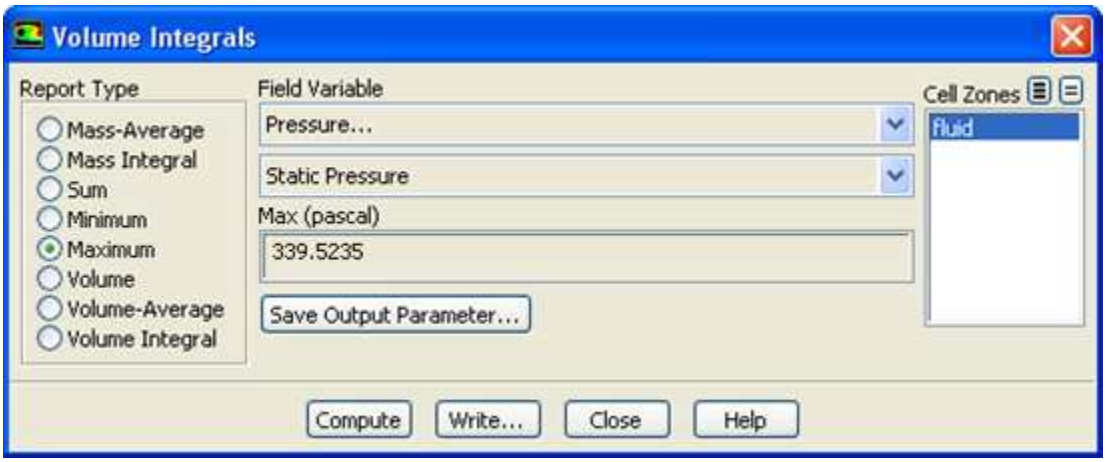
Compute
computes the specified integration on the selected surfaces.

Write...
opens *The **Select File** Dialog Box* (p. 33), which you can use to save the reported values to a file.

35.21.5. Volume Integrals Dialog Box

The **Volume Integrals** dialog box allows you to compute the volume, sum, maximum, minimum, volume integral, volume-averaged quantity, mass integral, or mass-averaged quantity of a specified field variable on a selected list of cell zones. See *Volume Integration* (p. 1521) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Report Type

contains radio buttons that control the method of volume integration.

Mass-Average

turns on the computation of the mass-averaged quantity on the cell zone.

Mass Integral

turns on the computation of the mass integral on the cell zone.

Sum

turns on the computation of the summation over all cells in the selected zone.

Minimum

computes the minimum value of the selected variable at each cell in the selected zone. selected zone.

Maximum

computes the maximum value of the selected variable at each cell in the selected zone. selected zone.

Volume

turns on the computation of the cell zone volume.

Volume Integral

turns on the computation of the volume integral on the cell zone.

Volume-Average

turns on the computation of the volume-weighted average on the cell zone.

Field Variable

contains a list of the field variables that can be used in the sum, volume integral, and average computations. This option is not active if the **Volume** option is active.

Cell Zones

is a selectable list of cell zones.

Total Volume

displays the result of the volume computation over all the selected zones. This label is visible when **Volume** is active.

Sum

displays the result of the summation over all the selected zones. This label is visible when **Sum** is active.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Max
displays the result of the maximum value of the selected zone(s). This label is visible when **Maximum** is active.

Min
displays the result of the minimum value of the selected zone(s). This label is visible when **Minimum** is active.

Total Volume Integral
displays the result of the volume-integral computation over all the selected zones. This label is visible when **Volume Integral** is active.

Volume-Weighted Average
displays the result of the volume-averaged computation over all the selected zones. This label is visible when **Volume-Average** is active.

Total Mass-Weighted Integral
displays the result of the mass-integral computation over all the selected zones. This label is visible when **Mass Integral** is active.

Mass-Weighted Average
displays the result of the mass-averaged computation over all the selected zones. This label is visible when **Mass-Average** is active.

Save Output Parameter...
opens the *Save Output Parameter Dialog Box* (p. 2044).

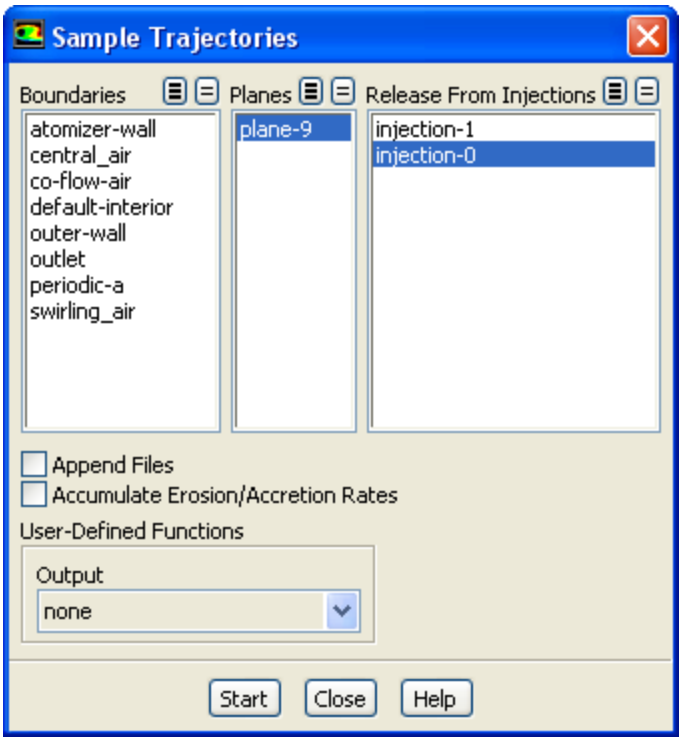
Compute
computes the specified integration on the selected zones.

Write...
opens *The **Select File** Dialog Box* (p. 33), which you can use to save the reported values to a file.

35.21.6. Sample Trajectories Dialog Box

The **Sample Trajectories** dialog box allows the writing of particle states (position, velocity, diameter, temperature, and mass flow rate) at various boundaries and planes (lines in 2D). See *Sampling of Trajectories* (p. 1082) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Boundaries
lists boundaries that can be chosen as the surfaces at which samples will be written.

Lines
(in 2D) lists lines that can be chosen as the surfaces at which samples will be written.

Planes
(in 3D) lists planes that can be chosen as the surfaces at which samples will be written.

Release From Injections
lists injections from which the injection to be tracked is chosen.

Append Files
causes the results of multiple calculations to be appended to a single file.

Accumulate Erosion/Accretion Rates
causes erosion and accretion rates to be accumulated for repeated trajectory calculations.

User-Defined Functions
allow control of the format and the information written for the sample output.

Output
contains a drop-down list of available user-defined functions.

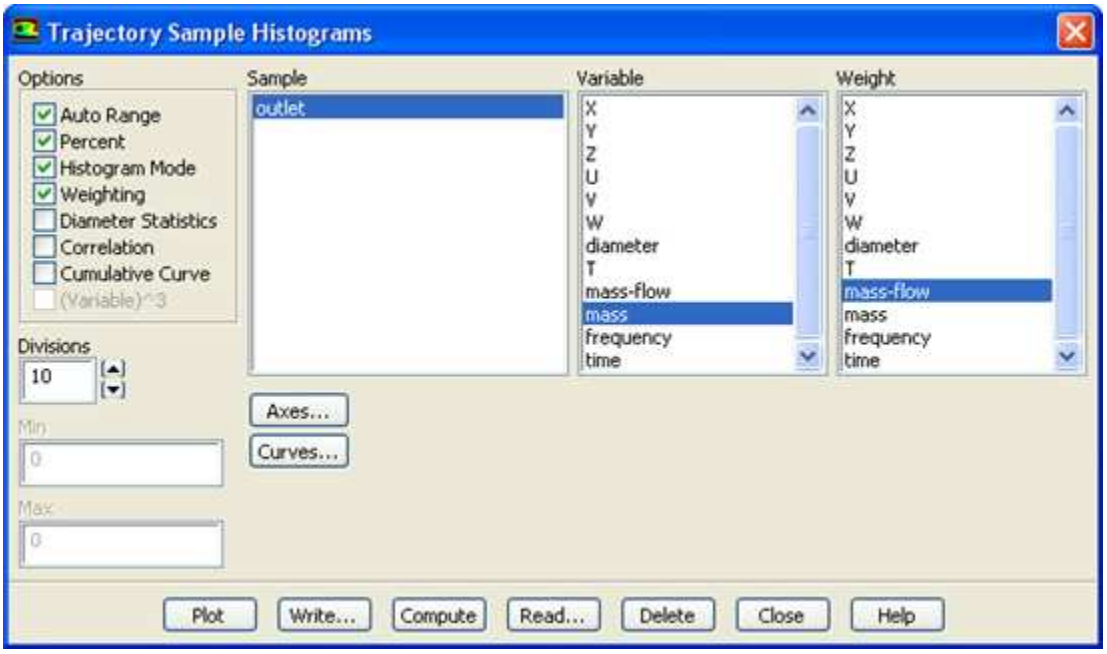
Compute
causes the particles to be tracked and their status to be written to files when they encounter selected surfaces. This button will not appear for unsteady particle tracking.

Start
initiates sampling for unsteady particle tracking. This button will replace the **Compute** button if you are performing unsteady particle tracking. After you click it, it will change to the **Stop** button. Click **Stop** to stop the sampling. (The label will change back to **Start**.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

35.21.7. Trajectory Sample Histograms Dialog Box

The **Trajectory Sample Histograms** dialog box allows the plotting of histograms from sample files created in the *Sample Trajectories Dialog Box* (p. 2036). See *Histogram Reporting of Samples* (p. 1084) for details about the items below.



Controls

Options

contains check buttons for histogram options.

Auto Range

toggles between automatic and manual settings of the histogram range.

Percent

causes the plot to indicate the percent of particles. Deselecting this will result in the actual number of particles being plotted.

Histogram Mode

allows you to display the histogram with or without bars.

Weighting

allows you to apply a weight to the data sample.

Diameter Statistics

allows you to display a summary of diameter statistics for a selected variable in the console window.

Correlation

allows you to choose correlations between how one particle variable depends on another particle variable.

Cumulative Curve

allows you to compute a cumulative distribution curve for a selected variable.

(Variable^3)

allows you to plot the cumulative mass distribution for a constant particle density using the particle diameter.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Divisions
sets the number of "bins" in the histogram.

Sample
lists the data samples that have been read in.

Variable
lists the fields variables available in the selected sample.

Weight
lists the weighted fields variables available in the selected sample.

Correlation
lists the sampled variables, allowing you to choose the correlation variable.

Min
displays the minimum value of the variable selected in the **Variable** list. If **Auto Range** is off, you can set the minimum by typing a new value.

Max
displays the maximum value of the variable selected in the **Fields** list. If **Auto Range** is off, you can set the maximum by typing a new value.

Axes...
opens the *Axes Dialog Box* (p. 2022), which allows you to customize the histogram axes.

Curves...
opens the *Curves Dialog Box* (p. 2024), which allows you to customize the curves used in the histogram.

Plot
displays the histogram in the active graphics window.

Write...
allows you store the histograms in an XY-plot file format

Compute
updates the **Min** and **Max** values.

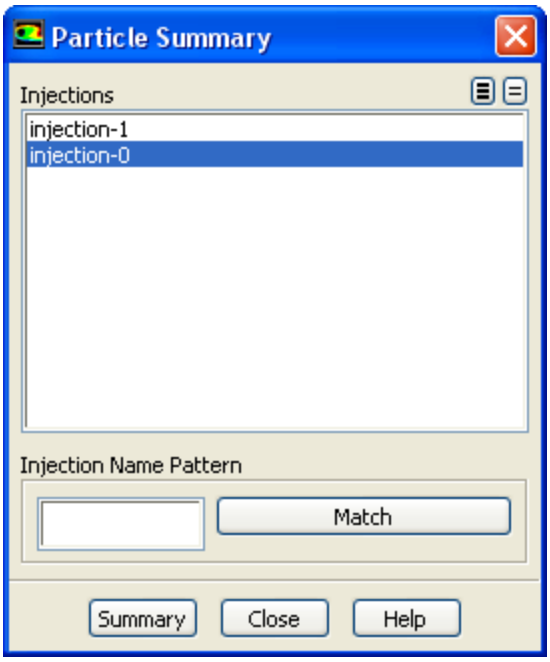
Read...
opens *The **Select File** Dialog Box* (p. 33), where you can select a sample file to be read.

Delete
removes the sample selected in the **Sample** list.

35.21.8. Particle Summary Dialog Box

The **Particle Summary** dialog box allows you to report a summary for particle injections. See *Summary Reporting of Current Particles* (p. 1085) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

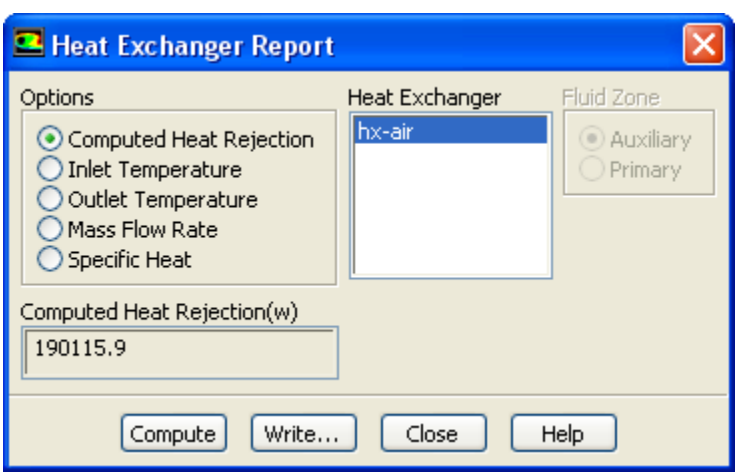
Injections
lists the particle injection(s) for which you can generate a summary.

Injection Name Pattern
specifies the pattern to look for in the names of injections. Type the pattern in the text field and click **Match** to select (or deselect) the injection in the **Injections** list with names that match the specified pattern. See *Summary Reporting of Current Particles* (p. 1085) for information about matching additional characters using * and ?.

Summary
prints the injection summary in the console window.

35.21.9. Heat Exchanger Report Dialog Box

The **Heat Exchanger Report** dialog box allows you to report a summary for heat exchangers. See *Postprocessing for the Heat Exchanger Model* (p. 794) for details about the items below.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Options

lists the available reporting options for the heat exchanger.

Computed Heat Rejection

allows you to report the heat rejection calculated from the heat exchanger.

Inlet Temperature

allows you to report the inlet temperature for both the primary and the auxiliary heat exchanger fluid.

Outlet Temperature

allows you to report the outlet temperature for both the primary and the auxiliary heat exchanger fluid.

Mass Flow Rate

allows you to report the mass flow rate for both the primary and the auxiliary heat exchanger fluid.

Specific Heat

allows you to report the specific heat for both the primary and the auxiliary heat exchanger fluid.

Result

displays the results of the calculations once the **Compute** button is selected.

Heat Exchanger

displays a list of heat exchanger fluid zones

Fluid Zone

(not available when **Computed Heat Rejection** option is selected.) allows you to report quantities for either the primary or auxiliary fluid zones.

Compute

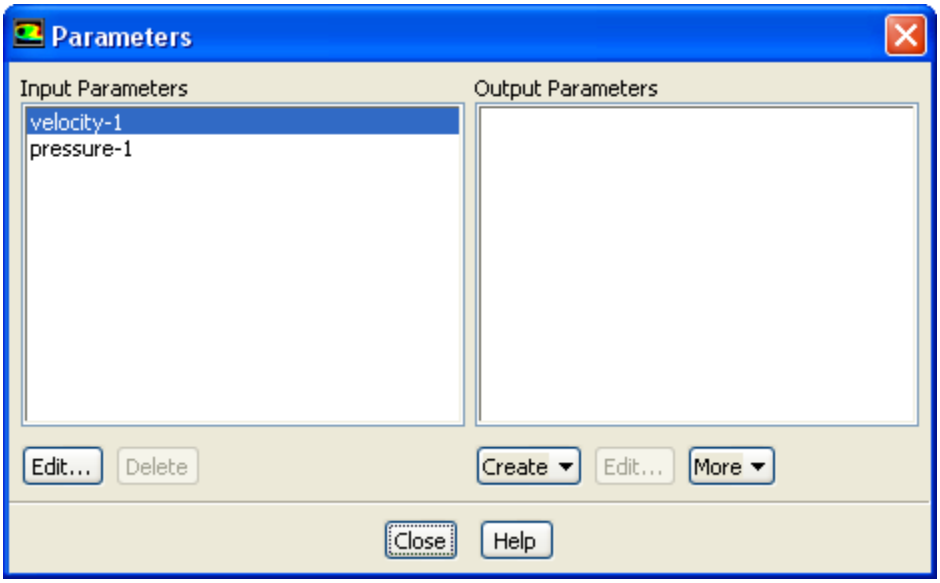
computes the specified quantity on the selected zones.

Write...

opens *The **Select File** Dialog Box* (p. 33), which you can use to save the reported values to a file.

35.21.10. Parameters Dialog Box

The **Parameters** dialog box allows you to create output parameters, which allow you to compare reporting values for different cases. See *Creating Output Parameters* (p. 1509) for details about the items below.



Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Input Parameters
contains a list of existing input parameters. See *Defining and Viewing Parameters* (p. 210) for details about creating input parameters.

Edit...
opens the *Input Parameter Properties Dialog Box* (p. 2043).

Important

When using ANSYS FLUENT in ANSYS Workbench, parameters are not editable, so the **Edit...** button becomes the **View...** button. This opens the *Input Parameter Properties Dialog Box* (p. 2043) where the parameter properties can only be viewed. For more information, see the separate ANSYS FLUENT in **Workbench** User's Guide.

Delete
removes the selected input parameter from the list of **Input Parameters**.

Output Parameters
contains a list of existing output parameters.

Create
contains a drop-down list that allows you to create additional output parameters. Available options include:

Fluxes
opens the *Flux Reports Dialog Box* (p. 2027).

Forces
opens the *Force Reports Dialog Box* (p. 2029).

Surface Integrals
opens the *Surface Integrals Dialog Box* (p. 2031).

Volume Integrals
opens the *Volume Integrals Dialog Box* (p. 2034).

Edit...
opens the dialog box corresponding to the selected item in the **Output Parameters** list.

More
contains a drop-down list containing additional tasks that you can perform, including:

Delete
displays a message in a dialog box, prompting you for a response to confirm the deletion of the output parameter.

Rename
allows you to edit the name of the output parameter through the *Rename Dialog Box* (p. 2043).

Print to Console
reports values to the console window. If you select multiple output parameters, then the output includes values from multiple output parameters.

Print All to Console
outputs the values from all output parameters to the console window.

Write...
allows you to store the output to a file. A dialog box is displayed allowing you to provide a file name.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Write All...
prompts you for a file name and then writes the values for all of the output parameters to a file.

35.21.11. Rename Dialog Box

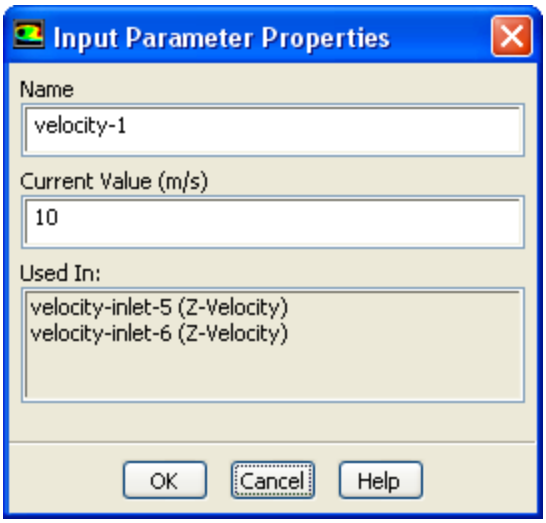
The **Rename** dialog box allows you to change the name of the output parameter that you created.

Controls

New Name
contains the new name of the output parameter.

35.21.12. Input Parameter Properties Dialog Box

The **Input Parameter Properties** dialog box allows you to create input parameters, which allow you to compare reporting values for different cases. See *Creating Output Parameters* (p. 1509) for details about the items below.



Controls

Name
contains the name of the input parameter.

Current Value
contains the current value of the input parameter.

Used In
indicates the cell zone or boundary condition where the input parameter is currently used.

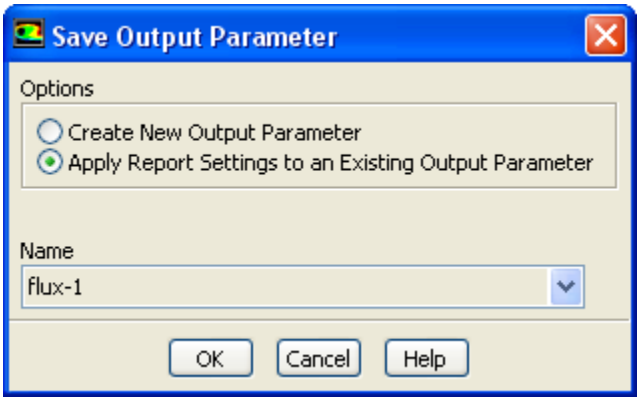
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Note

Source term parameters can only be specified using SI units. The default parameter name will not include the unit quantity name. Even if you have selected units other than SI for the source term parameters, you must still provide values assuming SI units for the (source-term) parameters in *both* FLUENT and Workbench.

35.21.13. Save Output Parameter Dialog Box

The **Save Output Parameter** dialog box allows you to save specific output parameters which allow you to compare reporting values for different cases. See *Creating Output Parameters* (p. 1509) for details about the items below.



Controls

Options

contains options for saving your output parameters.

Create New Output Parameter

allows you to create a new output parameter.

Apply Report Settings to an Existing Output Parameter

allows you to overwrite an existing output parameter of the same type.

Name

contains the name for the current output parameter.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Chapter 36: Menu Reference Guide

This reference guide provides information about the menus in FLUENT

36.1. File Menu
36.2. Mesh Menu
36.3. Define Menu
36.4. Solve Menu
36.5. Adapt Menu
36.6. Surface Menu
36.7. Display Menu
36.8. Report Menu
36.9. Parallel Menu
36.10. View Menu
36.11. Turbo Menu
36.12. Help Menu

36.1. File Menu

For additional information, please see the following sections:

36.1.1. File/Read/Mesh...
36.1.2. File/Read/Case...
36.1.3. File/Read/Data...
36.1.4. File/Read/Case & Data...
36.1.5. File/Read/PDF...
36.1.6. File/Read/ISAT Table...
36.1.7. File/Read/DTRM Rays...
36.1.8. File/Read/View Factors...
36.1.9. File/Read/Profile...
36.1.10. File/Read/Scheme...
36.1.11. File/Read/Journal...
36.1.12. File/Write/Case...
36.1.13. File/Write/Data...
36.1.14. File/Write/Case & Data...
36.1.15. File/Write/PDF...
36.1.16. File/Write/ISAT Table...
36.1.17. File/Write/Flamelet...
36.1.18. File/Write/Surface Clusters...
36.1.19. File/Write/Profile...
36.1.20. File/Write/Autosave...
36.1.21. File/Write/Boundary Mesh...

36.1.74. File/Exit

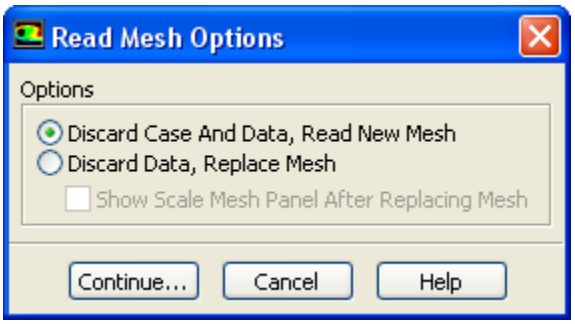
36.1.1. File/Read/Mesh...

The **File/Read/Mesh...** menu item opens the *Read Mesh Options Dialog Box* (p. 2047) which allows you to read or replace a mesh.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.1.1.1. Read Mesh Options Dialog Box

The **Read Mesh Options** dialog box is used to read or replace a mesh. See *Reading Mesh Files* (p. 62) for more information.



Controls

Options

allows you to read in a new mesh or replace the existing mesh.

Discard Case And Data, Read New Mesh

results in both the case and data files being discarded when reading in a new mesh.

Discard Data, Replace Mesh

results in the data file being discarded when replacing an existing mesh.

Show Scale Mesh Panel After Replacing Mesh

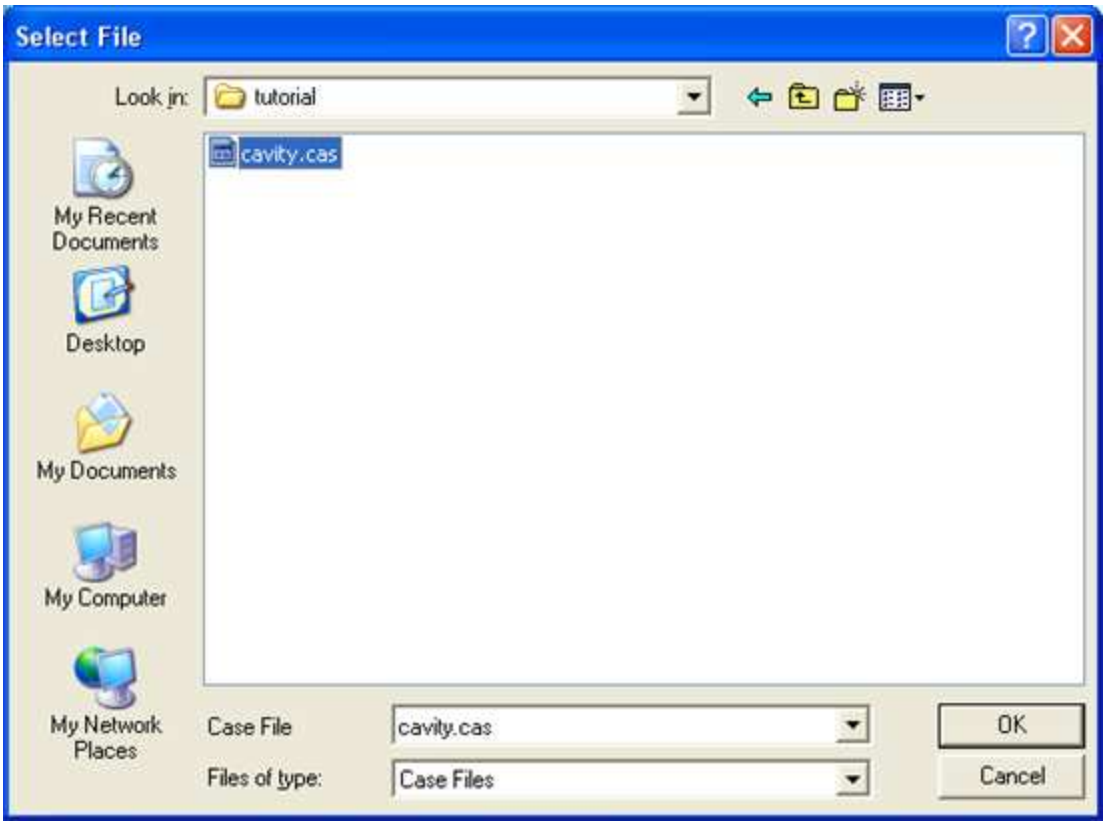
gives you the option to have the *Scale Mesh Dialog Box* (p. 1634) appear automatically for you to check or scale your mesh.

36.1.2. File/Read/Case...

The **File/Read/Case...** menu item is used to read in an ANSYS FLUENT case file (extension `.cas`), or a mesh file (extension `.msh`, `.grd`, `.MSH`, or `.GRD`) that has been saved in the native format for ANSYS FLUENT. See *Reading Mesh Files* (p. 62) and *Reading and Writing Case and Data Files* (p. 63) for details.

The **File/Read/Case...** menu item opens *The **Select File** Dialog Box* (p. 33) which allows you to select the appropriate file to be read.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



36.1.3. File/Read/Data...

The **File/Read/Data...** menu item is used to read in an ANSYS FLUENT data file (which has a `.dat` extension) or parallel data file (which has a `.pdat` extension). This menu item will not be available until you read in a case or mesh file. See *Reading and Writing Data Files* (p. 64) and *Reading and Writing Parallel Data Files* (p. 68) for details.

The **File/Read/Data...** menu item opens *The **Select File** Dialog Box* (p. 33) which allows you to select the appropriate file to be read.

36.1.4. File/Read/Case & Data...

The **File/Read/Case & Data...** menu item is used to read in an ANSYS FLUENT case file and the corresponding data file (e.g., `myfile.cas` and `myfile.dat`) together. See *Reading and Writing Case and Data Files Together* (p. 65) for details.

The **File/Read/Case & Data...** menu item opens *The **Select File** Dialog Box* (p. 33) which allows you to select the appropriate files to be read. Select the appropriate case file, and the corresponding data file (i.e., the file having the same name with a `.dat` extension) will also be read in.

36.1.5. File/Read/PDF...

The **File/Read/PDF...** menu item is used to read a PDF file (extension `.pdf`) created by ANSYS FLUENT for use with the non-premixed or partially premixed combustion model. This menu item is available only when the non-premixed or partially premixed combustion model has been enabled. See *Saving the Look-Up Tables* (p. 874) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.1.6. File/Read/ISAT Table...

The **File/Read/ISAT Table...** menu item is used to read an ISAT table (extension `.isat` for use with the Composition PDF Transport model. This menu item is available only when the Composition PDF Transport model has been enabled. See *Using ISAT Efficiently* (p. 925) for details.

36.1.7. File/Read/DTRM Rays...

The **File/Read/DTRM Rays...** menu item is used to read a ray file (extension `.ray`) created by ANSYS FLUENT for use with the DTRM (radiation model). This menu item is available only when the DTRM has been enabled. See *Writing and Reading the DTRM Ray File* (p. 709) for details.

36.1.8. File/Read/View Factors...

The **File/Read/View Factors...** menu item is used to read in a view factor file for use with the surface-to-surface (S2S) radiation model. This menu item is available only when the S2S model has been enabled. See *Reading View Factors into ANSYS FLUENT* (p. 720) for details.

36.1.9. File/Read/Profile...

The **File/Read/Profile...** menu item opens the **Select File** dialog for reading profiles (*Reading Profile Files* (p. 70)), It is used to read a cell zone or boundary condition profile file (extension `.prof`). A profile file defines profiles that can be used to specify flow conditions for a cell zone or a boundary. See *Profiles* (p. 366) for details.

36.1.10. File/Read/Scheme...

The **File/Read/Scheme...** menu item is used to read in a Scheme source file (extension `.scm`). See *Reading Scheme Source Files* (p. 73) for details.

36.1.11. File/Read/Journal...

The **File/Read/Journal...** menu item is used to read in a journal file (extension `.jou`) containing a sequence of ANSYS FLUENT commands. You can create a journal file using the **File/Write/Journal...** menu item. See *Creating and Reading Journal Files* (p. 73) for details.

36.1.12. File/Write/Case...

The **File/Write/Case...** menu item is used to save an ANSYS FLUENT case file. See *Reading and Writing Case Files* (p. 64) for details.

The **File/Write/Case...** menu item opens *The **Select File** Dialog Box* (p. 33) which allows you to save the file with a name of choice. The dialog box is similar to the **Select File** dialog for reading files, except that it has an additional option for writing binary files.

Important

- When ANSYS FLUENT writes a case file, the `.cas` extension is added to the file name specified, unless the name already ends with `.cas`.
- You can also write a compressed file by appending `.gz` or `.Z` to the file name. (See *Reading and Writing Compressed Files* (p. 59) for details about file compression.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.1.13. File/Write/Data...

The **File/Write/Data...** menu item is used to save an ANSYS FLUENT data file (which has a `.dat` extension) or parallel data file (which has a `.pdat` extension). See *Reading and Writing Data Files* (p. 64) and *Reading and Writing Parallel Data Files* (p. 68) for details.

Important

- When ANSYS FLUENT writes a data file, the `.dat` extension is added to the file name specified, unless the name already ends with `.dat` or `.pdat`.
- You can compress data files by appending `.gz` or `.Z` to the file name (see *Reading and Writing Compressed Files* (p. 59) for details about file compression). To compress parallel data files (i.e., files saved with a `.pdat` extension), you must use asynchronous file compression (see *Reading and Writing Case and Data Files* (p. 63)).

36.1.14. File/Write/Case & Data...

The **File/Write/Case & Data...** menu item is used to save an ANSYS FLUENT case file and data file at the same time (e.g., `myfile.cas` and `myfile.dat`). See *Reading and Writing Case and Data Files Together* (p. 65) for details.

Enter the name of the case file in the text entry box in the **Select File** dialog box and the corresponding data file (same file name, but with a `.dat` extension) will also be written.

36.1.15. File/Write/PDF...

The **File/Write/PDF...** menu item is used to write a PDF file after computing the look-up tables using the non-premixed or partially premixed combustion model in ANSYS FLUENT. This menu item is available only when the non-premixed or partially premixed combustion model has been enabled. See *Saving the Look-Up Tables* (p. 874) for details.

36.1.16. File/Write/ISAT Table...

The **File/Write/ISAT Table...** menu item is used to write an ISAT table. See *Using ISAT Efficiently* (p. 925) for details.

36.1.17. File/Write/Flamelet...

The **File/Write/Flamelet...** menu item is used to write a flamelet file generated using the non-premixed or partially premixed combustion model in ANSYS FLUENT. This menu item is available only when the non-premixed or partially premixed combustion model has been enabled. See The Laminar Flamelet Models Theory in the Theory Guide for details.

36.1.18. File/Write/Surface Clusters...

The **File/Write/Surface Clusters...** menu item is used to set parameters related to surface clusters and view factors for the surface-to-surface radiation model. It opens the *View Factors and Clustering Dialog Box* (p. 1660). The dialog box that you open using the **File/Write/Surface Clusters...** menu item is different than the one opened via the **Settings...** button in the **Radiation Model** dialog box, in that it saves the settings you specify to a file, which can be used to calculate the view factors outside of ANSYS FLUENT (see *Computing View*

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Factors Outside ANSYS FLUENT (p. 718)). When you click **OK**, the *The **Select File** Dialog Box* (p. 33) will open so that you can specify a name for the file where ANSYS FLUENT should save the settings.

36.1.19. File/Write/Profile...

The **File/Write/Profile...** menu item opens the *Write Profile Dialog Box* (p. 1811).

36.1.20. File/Write/Autosave...

The **File/Write/Autosave...** menu item opens the *Autosave Dialog Box* (p. 1943).

36.1.21. File/Write/Boundary Mesh...

The **File/Write/Boundary Mesh...** menu item is used to write the boundary zones (surface mesh) of the domain to a file. You can then read this file into GAMBIT or TGrid to produce an improved volume mesh. See *Writing a Boundary Mesh* (p. 72) for details.

36.1.22. File/Write/Start Journal...

The **File/Write/Start Journal...** menu item is used to start the recording of subsequent ANSYS FLUENT commands to a journal file. You can read this journal file back into the solver later (using the **File/Read/Journal...** menu item) to automate the execution of the recorded commands. See *Creating and Reading Journal Files* (p. 73) for details.

36.1.23. File/Write/Stop Journal

The **File/Write/Stop Journal** menu item replaces the **File/Write/Start Journal...** menu item after the recording of a journal file has begun. The **File/Write/Stop Journal** menu item is used to end the journal recording. See *Creating and Reading Journal Files* (p. 73) for details.

36.1.24. File/Write/Start Transcript...

The **File/Write/Start Transcript...** menu item is used to start the recording of a transcript file containing all input to and output from the solver. (You cannot read a transcript file back into the solver.) See *Creating Transcript Files* (p. 75) for details.

36.1.25. File/Write/Stop Transcript

The **File/Write/Stop Transcript** menu item replaces the **File/Write/Start Transcript...** menu item after the recording of a transcript file has begun. The **File/Write/Stop Transcript** menu item is used to end the transcript recording. See *Creating Transcript Files* (p. 75) for details.

36.1.26. File/Import/ABAQUS/Input File...

The **File/Import/ABAQUS/Input File...** menu item is used to import an ABAQUS input file (extension `.inp`) which contains the input description of a finite element model for the ABAQUS finite element program. See *ABAQUS Files* (p. 77) for details.

36.1.27. File/Import/ABAQUS/Filbin File...

The **File/Import/ABAQUS/Filbin File...** menu item is used to import an ABAQUS filbin file (extension `.fil`) which contains the finite element model and results data. See *ABAQUS Files* (p. 77) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.1.28. File/Import/ABAQUS/ODB File...

The **File/Import/ABAQUS/ODB File...** menu item is used to import an ABAQUS ODB file with a `.odb` extension. See *ABAQUS Files* (p. 77) for details.

36.1.29. File/Import/CFX/Definition File...

The **File/Import/CFX/Definition File...** menu item is used to import a CFX definition file (extension `.def`) which contains mesh information to be read into the solver. See *ANSYS CFX Files* (p. 77) for details.

36.1.30. File/Import/CFX/Result File...

The **File/Import/CFX/Result File...** menu item is used to import a CFX result file (extension `.res`). See *ANSYS CFX Files* (p. 77) for details.

36.1.31. File/Import/CGNS/Mesh...

The **File/Import/CGNS/Mesh...** menu item is used to read in a CGNS-format mesh file (extension `.cgns`). See *Meshes and Data in CGNS Format* (p. 78) for details.

36.1.32. File/Import/CGNS/Data...

The **File/Import/CGNS/Data...** menu item is used to read in a CGNS-format data file. See *Meshes and Data in CGNS Format* (p. 78) for details.

36.1.33. File/Import/CGNS/Mesh & Data...

The **File/Import/CGNS/Mesh & Data...** menu item is used to read in a set of CGNS-format mesh and data files. See *Meshes and Data in CGNS Format* (p. 78) for details.

36.1.34. File/Import/EnSight...

The **File/Import/EnSight...** menu item is used to import EnSight files (extension `.encas` or `.case`). See *EnSight Files* (p. 78) for details.

36.1.35. File/Import/FIDAP...

The **File/Import/FIDAP...** menu item is used to import an ANSYS FIDAP neutral file (extension `.FDNEUT` or `.unv`). See *ANSYS FIDAP Neutral Files* (p. 79) for details.

36.1.36. File/Import/GAMBIT...

The **File/Import/GAMBIT...** menu item is used to read in a neutral file from GAMBIT. See *GAMBIT and GeoMesh Mesh Files* (p. 79) for details.

36.1.37. File/Import/HYPERMESH ASCII...

The **File/Import/HYPERMESH ASCII...** menu item is used to import a **HYPERMESH ASCII** file (extension `.hm`, `.hma`, or `.hmascii`). See *HYPERMESH ASCII Files* (p. 79) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.1.38. File/Import/IC3M...

The **File/Import/IC3M...** menu item is used to import files created using ICEM CFD IC3M, in order to automatically set up a case file for a dynamic mesh simulation of an in-cylinder problem. This menu item is only available when running the 3D version of ANSYS FLUENT. See *IC3M Files* (p. 79) for details.

Important

IC3M files should not be used with ANSYS FLUENT in Workbench.

36.1.39. File/Import/I-deas Universal...

The **File/Import/I-deas Universal...** menu item is used to import an I-deas Universal file which contains mesh information and zone types to be read into the solver. See *I-deas Universal Files* (p. 80) for details.

36.1.40. File/Import/LSTC/Input File...

The **File/Import/LSTC/Input File...** menu item is used to import an LSTC input file (extension `.k`, `.key`, or `.dyn`) which contains the input description of a finite element model for the LS-DYNA finite element program. See *LSTC Files* (p. 80) for details.

36.1.41. File/Import/LSTC/State File...

The **File/Import/LSTC/State File...** menu item is used to import an LSTC state file (extension `.d3plot`) which contains control data, geometry data, and state data. See *LSTC Files* (p. 80) for details.

36.1.42. File/Import/Marc POST...

The **File/Import/Marc POST...** menu item is used to import a Marc POST file generated using the MSC Marc finite element program. See *Marc POST Files* (p. 81) for details

36.1.43. File/Import/Mechanical APDL/Input File...

The **File/Import/Mechanical APDL/Input File...** menu item is used to import a Mechanical APDL input file (extensions `.ans`, `neu`, `.cdb`, or `.prep7`) which contains mesh information to be read into the solver. See *Mechanical APDL Files* (p. 81) for details.

36.1.44. File/Import/Mechanical APDL/Result File...

The **File/Import/Mechanical APDL/Result File...** menu item is used to import a Mechanical APDL result file (extension `.rfl`, `.rst`, `.rth`, or `.rmg`). See *Mechanical APDL Files* (p. 81) for details.

36.1.45. File/Import/NASTRAN/Bulkdata File...

The **File/Import/NASTRAN/Bulkdata File...** menu item is used to import a NASTRAN Bullkdata file (extension `.nas`, `.dat`, or `.bdf`) which contains mesh information to be read into the solver. See *NASTRAN Files* (p. 81) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.1.46. File/Import/NASTRAN/Op2 File...

The **File/Import/NASTRAN/Op2 File...** menu item is used to import a NASTRAN Op2 file (extension `.op2`) which is an output binary data file containing data used in the NASTRAN finite element program. See *NASTRAN Files* (p. 81) for details.

36.1.47. File/Import/PATRAN/Neutral File...

The **File/Import/PATRAN/Neutral File...** menu item is used to read in a PATRAN Neutral file (extension `.neu`, `.out`, or `.pat`) zoned by named components (i.e., with the nodes placed into zones based on group name). The PATRAN neutral file contains mesh information to be read into the solver. See *PATRAN Neutral Files* (p. 82) for details.

36.1.48. File/Import/PATRAN/Result File...

The **File/Import/PATRAN/Result File...** menu item is used to import a PATRAN result file. See *PATRAN Neutral Files* (p. 82) for details.

36.1.49. File/Import/PLOT3D/Grid File...

The **File/Import/PLOT3D/Grid File...** menu item is used to import a PLOT3D grid file (extension `.g`, `.x`, `.xyz`, or `.grd`). See *PLOT3D Files* (p. 82) for details.

36.1.50. File/Import/PLOT3D/Result File...

The **File/Import/PLOT3D/Result File...** menu item s used to import a PLOT3D result file (extension `.g`, `.x`, `.xyz`, or `.grd`). See *PLOT3D Files* (p. 82) for details.

36.1.51. File/Import/PTC Mechanica Design...

The **File/Import/PTC Mechanica Design...** menu item is used to import a PTC Mechanica Design file (extension `.neu`) which contains analysis, model, and results data (only in binary form). See *PTC Mechanica Design Files* (p. 82) for details.

36.1.52. File/Import/Tecplot...

The **File/Import/Tecplot...** menu item is used to read in a Tecplot binary file. See *Tecplot Files* (p. 83) for details.

36.1.53. File/Import/FLUENT 4 Case File...

The **File/Import/ANSYS FLUENT 4 Case File...** menu item is used to read in a case file created in ANSYS FLUENT 4. See *FLUENT 4 Case Files* (p. 83) for details.

36.1.54. File/Import/PreBFC File...

The **File/Import/PreBFC File...** menu item is used to read in a structured (quadrilateral or hexahedral) mesh that was created using PreBFC. See *PreBFC Files* (p. 83) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.1.55. File/Import/Partition/Metis...

The **File/Import/Partition/Metis...** menu item is used to partition a mesh and then read it into the parallel version of ANSYS FLUENT. See *Using the Partition Filter* (p. 1622) for an explanation of the difference between this menu item and the **File/Import/Partition/Metis Zone...** menu item.

36.1.56. File/Import/Partition/Metis Zone...

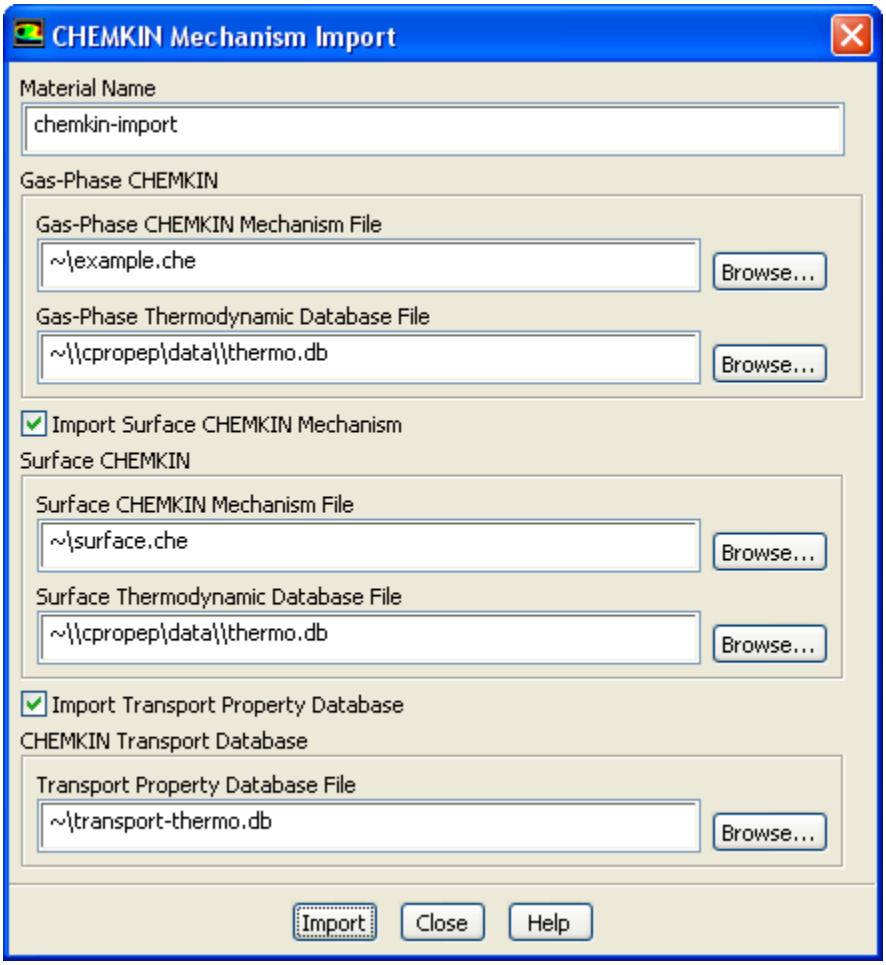
The **File/Import/Partition/Metis Zone...** menu item is used to partition each cell zone in a mesh individually and then read the mesh into the parallel version of ANSYS FLUENT. See *Using the Partition Filter* (p. 1622) for an explanation of the difference between this menu item and the **File/Import/Partition/Metis...** menu item.

36.1.57. File/Import/CHEMKIN Mechanism...

The **File/Import/CHEMKIN Mechanism...** menu item opens the *CHEMKIN Mechanism Import Dialog Box* (p. 2055).

36.1.57.1. CHEMKIN Mechanism Import Dialog Box

The **CHEMKIN Mechanism Import** dialog box is used to import a CHEMKIN-format chemical mechanism file into ANSYS FLUENT. See *Importing a Volumetric Kinetic Mechanism in CHEMKIN Format* (p. 827) for details.



Controls

Material Name
specifies a name for the material.

Gas-Phase CHEMKIN
contains inputs for importing the gas-phase CHEMKIN mechanism.

Gas-Phase CHEMKIN Mechanism File
specifies the name of the gas-phase CHEMKIN-format file. If the file is not in the current working folder, include the full path to the folder where it is located.

Gas-Phase Thermodynamic Database File
specifies the location of the gas-phase thermodynamic database file.

Import Surface CHEMKIN Mechanism
enables the importing of the surface CHEMKIN mechanism.

Surface CHEMKIN
contains inputs for importing the surface CHEMKIN mechanism. This option is available only when the **Import Surface CHEMKIN Mechanism** option is enabled.

Surface CHEMKIN Mechanism File
specifies the name of the surface CHEMKIN-format file.

Surface Thermodynamic Database File
specifies the location of the surface thermodynamic database file.

Import Transport Property Database
enables the importing of the CHEMKIN transport database.

CHEMKIN Transport Database
contains the input for importing the **Transport Property Database File**. This option is available only when the **Import Transport Property Database** option is enabled.

Transport Property Database File
specifies the name of the transport property database file.

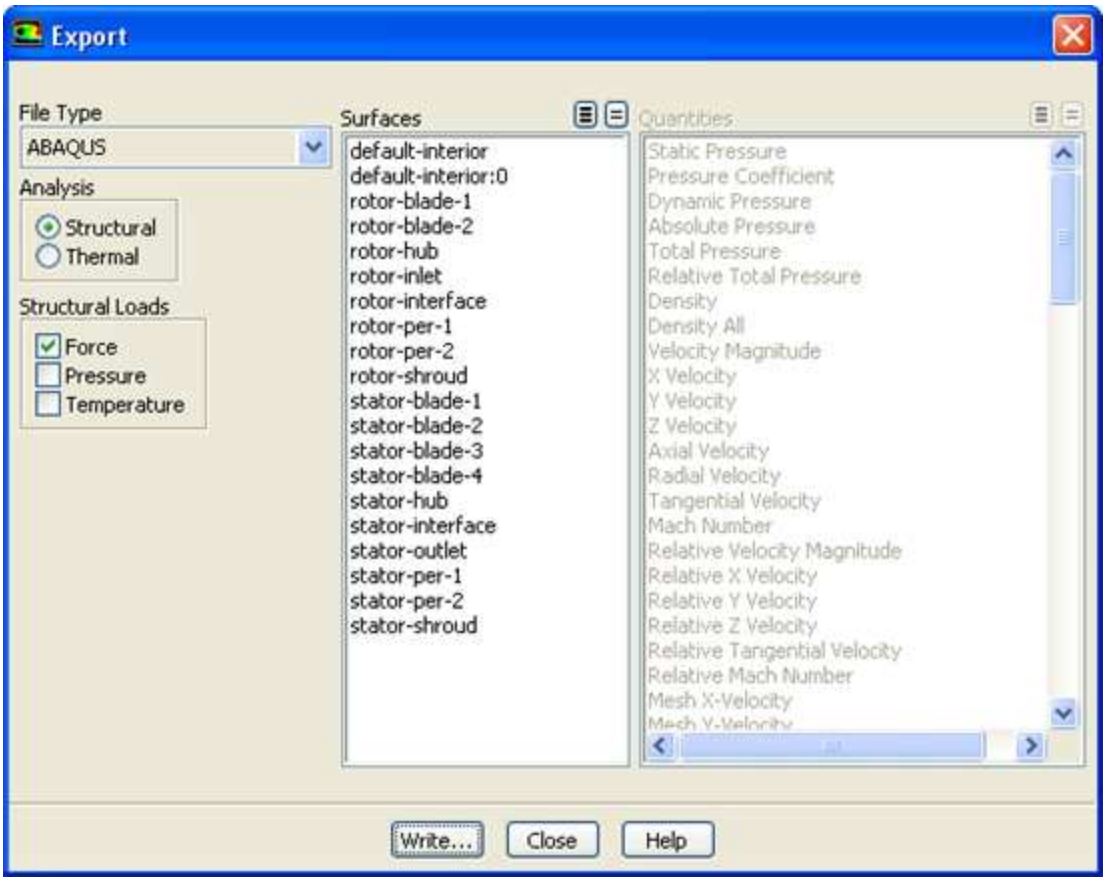
36.1.58. File/Export/Solution Data..

The **File/Export/Solution Data...** menu item opens the *Export Dialog Box* (p. 2056).

36.1.58.1. Export Dialog Box

The **Export** dialog box allows you to write data that can be read by other data visualization and postprocessing tools. See *Exporting Solution Data* (p. 84) for a complete description of the available data formats and how to use the dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

File Type

contains a drop-down list that controls the output file format that will be written using the **Write...** button.

ABAQUS

allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to an ABAQUS file (extension `.inp`).

ASCII

allows you to specify the surface(s), scalars, location from which the values of scalar functions are to be taken, and the delimiter separating the fields, to be exported to an **ASCII** file.

AVS

allows you to specify the scalars you want to write to be exported to an AVS file.

CFD-Post Compatible

allows you to specify the scalars you want to write to be exported to a file compatible to the **CFD-Post** application.

CGNS

allows you to specify the scalars you want to write and the location from which the values of scalar functions are to be taken, to be exported to a **CGNS** file (extension `.cgns`).

Data Explorer

allows you to specify the surface(s) and the scalars you want to write to be exported to a Data Explorer file (extension `.dx`).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

EnSight Case Gold
allows you to specify the scalars you want to write, the location from which the values of scalar functions are to be taken, and the file format, to be exported to an EnSight file (extension `.geo`, `.vel`, `.scl1`, or `.encas`).

FAST
allows you to specify the scalars you want to write, to be exported as a grid file (Plot3D format), a velocity file, and a scalar file. This option is available only for a triangular or tetrahedral mesh.

FAST Solution
allows you to export a single file containing density, velocity, and total energy data. This option is available only for a triangular or tetrahedral mesh.

Fieldview Unstructured
allows you to specify the scalars you want to write, to be exported to a

I-deas Universal
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to an I-deas Universal file.

Mechanical APDL Input
allows you to specify the surface(s) and optional loads, based on the kind of finite element analysis selected, to be exported to a Mechanical APDL **Input** file (extension `.cdb`).

NASTRAN
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a NASTRAN file (extension `.bdf`).

PATRAN
allows you to specify the surface(s), scalars, and optional loads, based on the kind of finite element analysis selected, to be exported to a PATRAN neutral file (extension `.out`).

RadTherm
allows you to specify the surface(s) for which you want to write data and the method of writing the heat transfer coefficient, to be exported to a PATRAN neutral file (extension `.neu`). This option is available only when the **Energy Equation** is enabled.

Tecplot
allows you to specify the surface(s) and the scalars you want to write, to be exported to a Tecplot file.

Surfaces
specifies the surfaces for which data is to be written for an **ABAQUS**, **ASCII**, Data Explorer, I-deas Universal, **Mechanical APDL Input**, NASTRAN, PATRAN, **RadTherm**, or Tecplot file.

Quantities
specifies valid functions for output. The attributes of the list are modified based on the active file type. The list may be a single-selection or a multiple-selection list or it may be disabled, depending on the selected **File Type**.

Structural Loads
contains optional structural loads that can be written to **ABAQUS**, I-deas Universal, **Mechanical APDL Input**, NASTRAN, and PATRAN files. This option is available only when **Structural** analysis is selected.

Force
enables force to be written as a load for a structural analysis.

Pressure
enables pressure to be written as a load for a structural analysis.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Temperature
enables temperature to be written as a load for a structural analysis. This option is available only when the **Energy Equation** is enabled.

Thermal Loads
contains optional thermal loads that can be written to **ABAQUS**, I-deas Universal, **Mechanical APDL Input**, NASTRAN, and PATRAN files. This option is available only when **Thermal** analysis is selected.

Temperature
enables temperature to be written as a load for a thermal analysis.

Heat Flux
enables heat flux to be written as a load for a thermal analysis.

Heat Trans Coeff
enables heat transfer coefficient to be written as a load for a thermal analysis.

Location (for ASCII, CGNS, and EnSight Case Gold formats)
specifies the location from which the values of scalar functions are to be taken.

Node
specifies that data values at the node points are to be exported.

Cell Center
specifies that data values from the cell centers are to be exported.

Analysis (for ABAQUS, I-deas Universal, Mechanical APDL Input, NASTRAN, and PATRAN formats
specifies the finite element analysis intended.

Structural
specifies structural analysis and allows you to select the **Structural Loads** to be written.

Thermal
specifies thermal analysis and allows you to select the **Thermal Loads** to be written.

Delimiter (for ASCIIformat only)
specifies the delimiter used to separate the data fields.

Comma
specifies comma as the delimiter separating the data fields.

Space
specifies space as the delimiter separating the data fields.

Transient (for EnSight Case Gold only)
contains options for exporting transient data.

Transient
enables export of transient data.

Separate Files for Each Timestep
enables writing separate files for each timestep.

Append Frequency
specifies the frequency for appending the data during the solution process.

Important

The **Append Frequency** option is replaced by the **Write Frequency** option when **Separate Files for Each Timestep** is enabled. You can specify the frequency for writing the separate files.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

File Name
specifies the root name for the files to be saved.

Format (for EnSight Case Goldand CFD-Post Compatible)
specifies the file format.

Binary
specifies the file format as binary.

ASCII
specifies the file format as ASCII.

Heat Transfer Coefficient (for RadTherm format only)
specifies the basis for the heat transfer coefficient exported.

Flux Based
specifies the flux based method for writing the heat transfer coefficient.

Wall Function
specifies the wall function based method for writing the heat transfer coefficient.

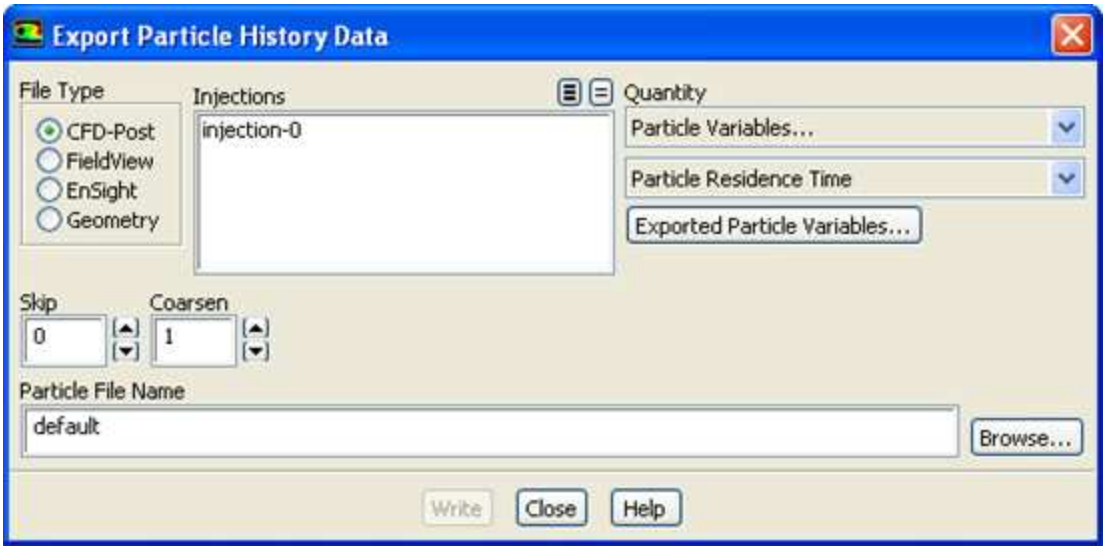
Write...
opens *The **Select File** Dialog Box* (p. 33) for writing the specified function(s) in the specified format.

36.1.59. File/Export/Particle History Data..

The **File/Export/Particle History Data...** menu item opens the *Export Particle History Data Dialog Box* (p. 2060).

36.1.59.1. Export Particle History Data Dialog Box

The **Export Particle History Data** dialog box allows you to export particle history data as your solution progresses. See *Exporting Steady-State Particle History Data* (p. 97) for details.



Controls

Type
specifies the type of the file you want to write.

CFD-Post
allows you to write the file in CFD-Post particle tracks format, which can be read in **CFD-Post**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

FieldView
allows you to write the file in **FIELDVIEW** format, which can be read in **FIELDVIEW**.

EnSight
allows you to write the file in **EnSight** format.

Geometry
allows you to write the file in `.ibl` format, which can be read in GAMBIT (not available when **Unsteady Particle Tracking** is enabled under the **Define/Models/Discrete Phase...** menu option).

Injections
allows you to select the required injection from the list of predefined injections.

Quantity
contains the list of variables for which you can export the particle data.

Skip
allows you to "thin" or "sample" the number of particles that are exported.

Coarsen
reduces the exported file size by reducing the number of points that are written for a given trajectory. This is only valid for steady-state cases.

Particle File Name
allows you to specify the file name/directory for the exported data, using the **Browse...** button.

Encas File Name
is the file name you will specify if you selected **EnSight** under **Type**. Use the **Browse...** button to select the `.encas` file that was created when you exported the file with the **File/Export...** menu option.

Number of Particle Time Steps
appears when you select **EnSight** under **Type**. The specified number is the number of particle time steps that are saved to the `.encas` file.

36.1.60. File/Export/During Calculation/Solution Data..

The **File/Export/During Calculation/Solution Data...** menu item opens the *Automatic Export Dialog Box* (p. 1946) (transient cases only).

36.1.61. File/Export/During Calculation/Particle History Data..

The **File/Export/During Calculation/Particle History Data...** menu item opens the *Automatic Particle History Data Export Dialog Box* (p. 1949) (transient cases only).

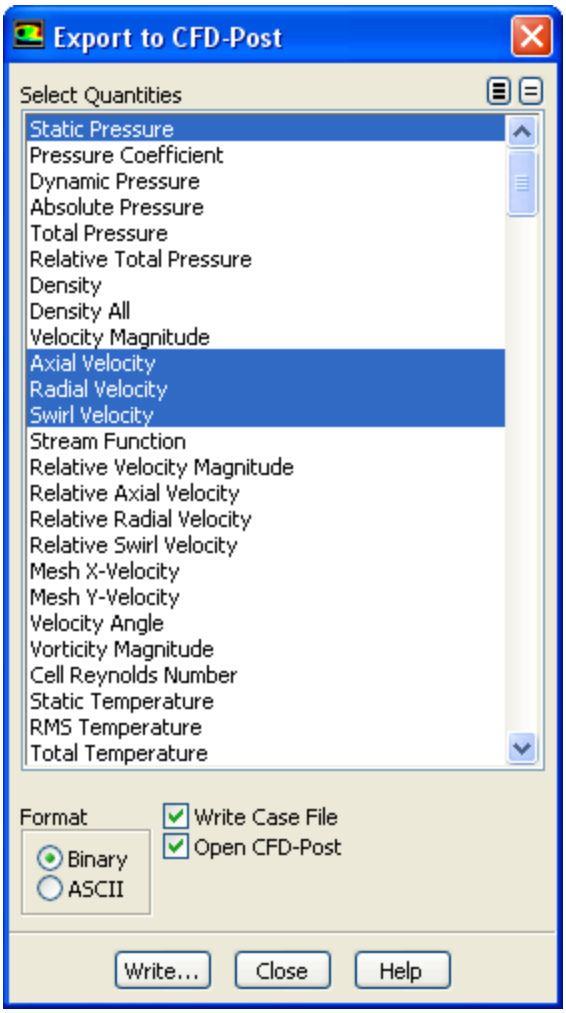
36.1.62. File/Export to CFD-Post...

The **File/Export to CFD-Post...** menu item opens the *Export to CFD-Post Dialog Box* (p. 2061).

36.1.62.1. Export to CFD-Post Dialog Box

The **Export to CFD-Post** dialog box allows you to select the quantities that you would like to export to CFD-Post. See *Exporting to ANSYS CFD-Post* (p. 104) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Select Quantities
contains a selectable list where you can choose the quantities to export.

Format
allows you to save your file in **Binary** or **ASCII** format.

Write Case File
will write the selected quantities to a file.

Open CFD-Post
will open a CFD-Post and the case and `.cdat` files will be loaded. CFD-Post will display the results.

Write...
opens the **Select File** dialog box, where you will save your file.

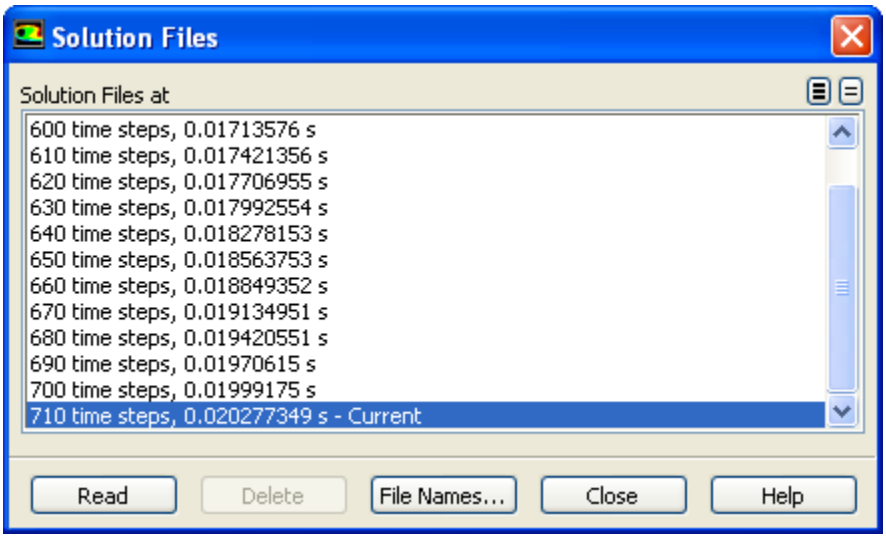
36.1.63. File/Solution Files...

The **File/Solution Files...** menu item opens the *Solution Files Dialog Box* (p. 2062).

36.1.63.1. Solution Files Dialog Box

The **Solution Files** dialog box allows you to manage the files that were created through the *Autosave Dialog Box* (p. 1943). See *Managing Solution Files* (p. 106) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Solution Files at
contains a selectable list where you can choose the files to read or delete.

Read
makes the selected file the current file. Note that if more than one file is selected, the **Read** button is disabled. When an earlier solution is made current, the solution files that were generated for a later iteration/time step will be removed from this list when the calculation continues.

Delete
removes the selected solution files.

File Names...
allows you to obtain information about the solution files and the path of the associated files.

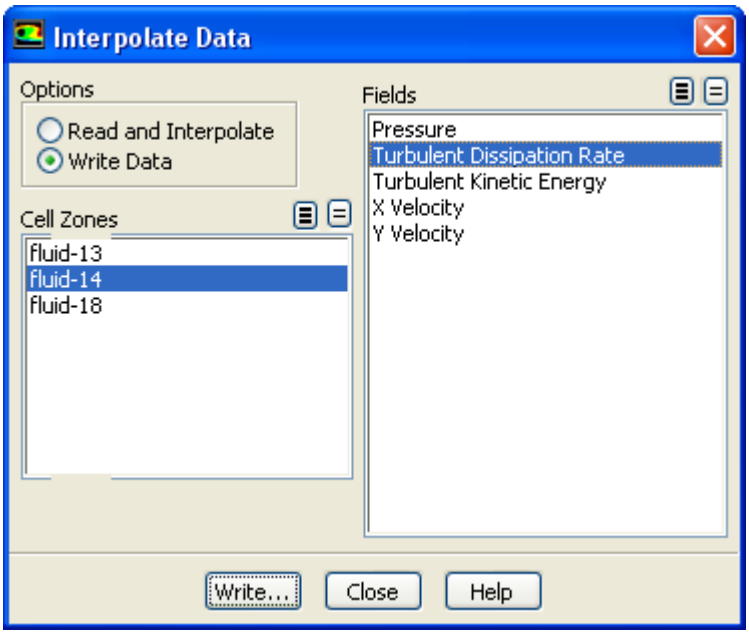
36.1.64. File/Interpolate...

The **File/Interpolate...** menu item opens the *Interpolate Data Dialog Box* (p. 2063).

36.1.64.1. Interpolate Data Dialog Box

The **Interpolate Data** dialog box allows you to interpolate solution data from one mesh to another. See *Mesh-to-Mesh Solution Interpolation* (p. 106) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains the interpolation options.

Read and Interpolate

allows you to read and interpolate solution data onto the current mesh.

Write Data

allows you to write an interpolation file for the solution data to be interpolated onto another mesh.

Cell Zones

is a list of cell zones that can be selected.

Fields

is a list of all available data fields that can be selected. This list is available only when **Write Data** is selected under **Options**.

Read...

opens *The **Select File** Dialog Box* (p. 33), in which you can specify the file to be read. This button is available only when the **Read and Interpolate** option is selected.

Write...

opens *The **Select File** Dialog Box* (p. 33), in which you can specify a name for the file to be saved and then save the file. This button replaces the **Read...** button when the **Write Data** option is selected.

36.1.65. File/EM Mapping/HFSS...

The **File/EM Mapping/HFSS...** menu item opens the *HFSS Mapping Dialog Box* (p. 2065).

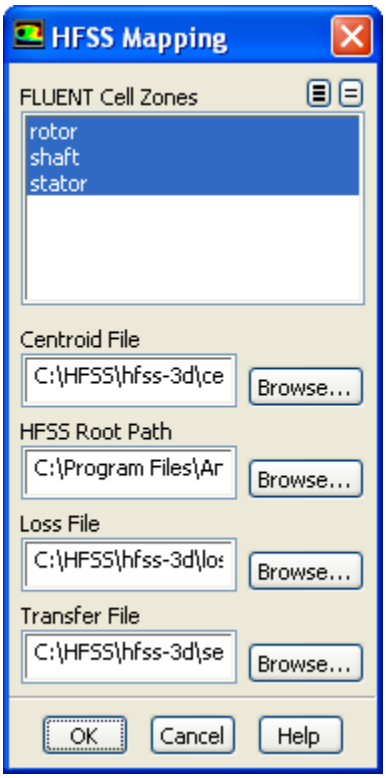
Important

EM Mapping is only available in serial ANSYS FLUENT. It is not available in parallel ANSYS FLUENT.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.1.65.1. HFSS Mapping Dialog Box

The **HFSS Mapping** dialog box allows you to map the volumetric loss results from an Ansoft HFSS electromagnetic simulation onto the centroids of solid cells in the FLUENT mesh as a heat source. See *Mapping Electromagnetic Losses* (p. 109) for details.



Controls

FLUENT Cell Zones
contains a list of solid cell zones from the FLUENT mesh, onto which the loss information can be mapped.

Centroid File
specifies the name of a `.dat` file that FLUENT generates during the mapping process, which provides cell centroid data to HFSS. If you do not want to save the file in the current working folder, include the full path to the appropriate folder.

HFSS Root Path
specifies the root path for the HRSS application.

Loss File
specifies the name of a `.xml` file that HFSS generates during the mapping process, which provides the volumetric loss data to FLUENT. If you do not want to save the file in the current working folder, include the full path to the appropriate folder.

Transfer File
specifies the name of the transfer file you exported from HFSS in anticipation of the mapping process. If the file was not exported to the current working folder, include the full path to the appropriate folder.

36.1.66. File/EM Mapping/Maxwell...

The **File/EM Mapping/Maxwell...** menu item opens the *Maxwell Mapping Dialog Box* (p. 2066).

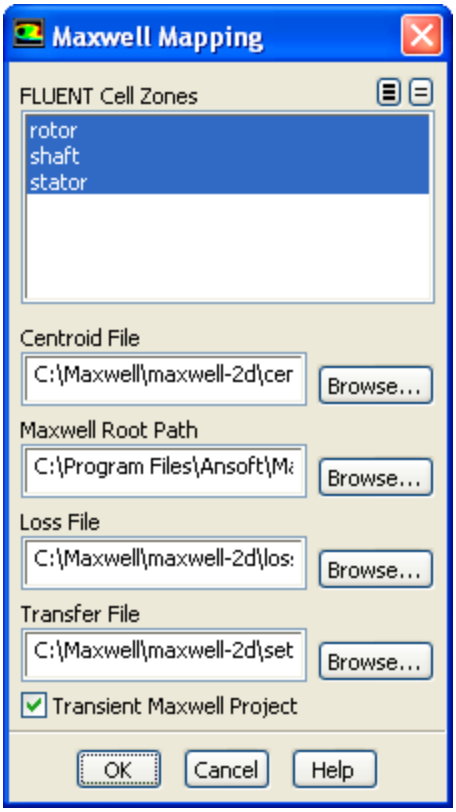
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Important

EM Mapping is only available in serial ANSYS FLUENT. It is not available in parallel ANSYS FLUENT.

36.1.66.1. Maxwell Mapping Dialog Box

The **Maxwell Mapping** dialog box allows you to map the volumetric loss results from an Ansoft Maxwell electromagnetic simulation onto the centroids of solid cells in the FLUENT mesh as a heat source. See *Mapping Electromagnetic Losses* (p. 109) for details.



Controls

FLUENT Cell Zones
contains a list of solid cell zones from the FLUENT mesh, onto which the loss information can be mapped.

Centroid File
specifies the name of a `.dat` file that FLUENT generates during the mapping process, which provides cell centroid data to Maxwell. If you do not want to save the file in the current working folder, include the full path to the appropriate folder.

Maxwell Root Path
specifies the root path for the Maxwell application.

Loss File
specifies the name of a `.xml` file that Maxwell generates during the mapping process, which provides the volumetric loss data to FLUENT. If you do not want to save the file in the current working folder, include the full path to the appropriate folder.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Transfer File

specifies the name of the transfer file you exported from Maxwell in anticipation of the mapping process. If the file was not exported to the current working folder, include the full path to the appropriate folder.

Transient Maxwell Project

specifies whether or not the Maxwell simulation run in anticipation of the mapping process was transient.

36.1.67. File/EM Mapping/Q3D...

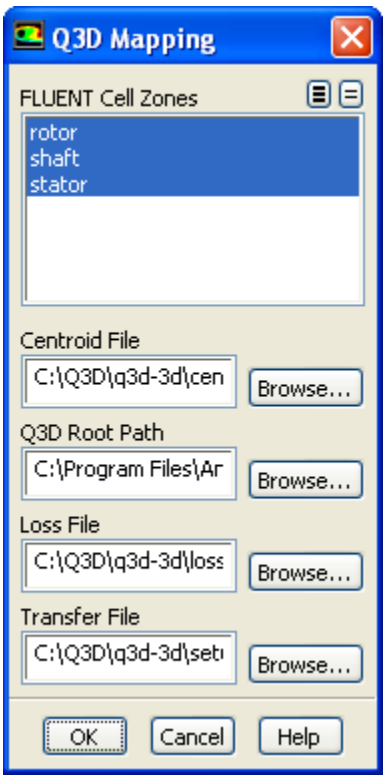
The **File/EM Mapping/Q3D...** menu item opens the *Q3D Mapping Dialog Box* (p. 2067).

Important

EM Mapping is only available in serial ANSYS FLUENT. It is not available in parallel ANSYS FLUENT.

36.1.67.1. Q3D Mapping Dialog Box

The **Q3D Mapping** dialog box allows you to map the volumetric loss results from an Ansoft Q3D Extractor electromagnetic simulation onto the centroids of solid cells in the FLUENT mesh as a heat source. See *Mapping Electromagnetic Losses* (p. 109) for details.



Controls

FLUENT Cell Zones

contains a list of solid cell zones from the FLUENT mesh, onto which the loss information can be mapped.

Centroid File

specifies the name of a `.dat` file that FLUENT generates during the mapping process, which provides cell centroid data to Q3D Extractor. If you do not want to save the file in the current working folder, include the full path to the appropriate folder.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Q3D Root Path

specifies the root path for the Q3D Extractor application.

Loss File

specifies the name of a `.xml` file that Q3D Extractor generates during the mapping process, which provides the volumetric loss data to FLUENT. If you do not want to save the file in the current working folder, include the full path to the appropriate folder.

Transfer File

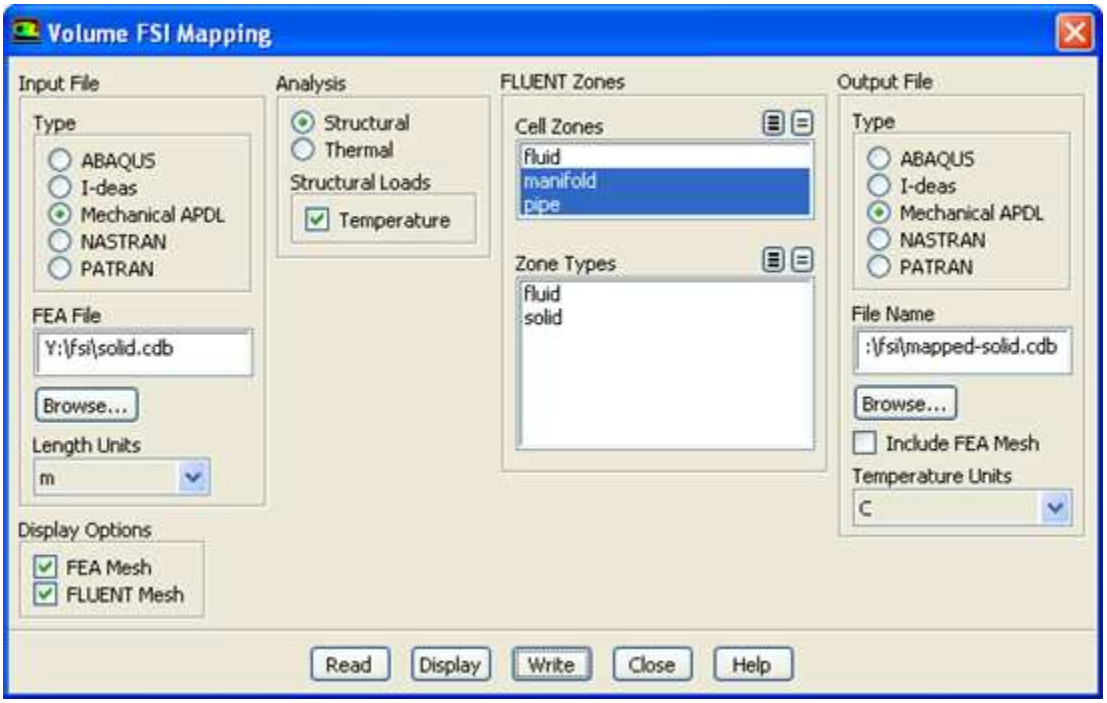
specifies the name of the transfer file you exported from Q3D Extractor in anticipation of the mapping process. If the file was not exported to the current working folder, include the full path to the appropriate folder.

36.1.68. File/FSI Mapping/Volume...

The **File/FSI Mapping/Volume...** menu item opens the *Volume FSI Mapping Dialog Box* (p. 2068).

36.1.68.1. Volume FSI Mapping Dialog Box

The **Volume FSI Mapping** dialog box allows you to map cell data for a given geometry from an ANSYS FLUENT file onto a file with a different mesh and format. See *Mapping Data for Fluid-Structure Interaction (FSI) Applications* (p. 113) for a complete description of how to use the dialog box.



Controls

Input File

contains parameters related to the input file.

Type

contains the options for the format of the input mesh file.

ABAQUS

specifies that an ABAQUS file will be used as the input mesh file (extension `.inp`).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

I-deas
specifies that an I-deas file will be used as the input mesh file (extension `.unv`).

Mechanical APDL
specifies that a Mechanical APDL file will be used as the input mesh file (extension `.cdb`).

NASTRAN
specifies that a NASTRAN file will be used as the input mesh file (extension `.bdf`).

PATRAN
specifies that a PATRAN file will be used as the input mesh file (extension `.out`).

FEA File
specifies the name of the input mesh file (see the **Input File Type** descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.

Browse...
opens the *The **Select File** Dialog Box* (p. 33), which you can use to specify the input mesh file instead of entering it in the **Input File** text-entry box.

Length Units
specifies the unit of length used in the input file.

Display Options
allows you to choose either the **FEA Mesh** or the **ANSYS FLUENT Mesh** (or both).

Analysis
contains the options for the kind of data to be mapped.

Structural
specifies that data fields relevant for a structural analysis will be mapped.

Thermal
specifies that data fields relevant for a thermal analysis will be mapped.

Structural Loads
consists of a list of available loads, including **Force**, **Pressure**, and **Temperature**.

FLUENT Zones
contains a list of available cell zones from the current ANSYS FLUENT file from which cell data will be mapped.

Output File
contains the options for the format of the file that will be created from the input mesh file and the mapped data.

Type
contains the options for the format of the output mesh file.

ABAQUS
specifies that an ABAQUS file will be used as the output mesh file (extension `.inp`).

I-deas
specifies that an I-deas file will be used as the output mesh file (extension `.unv`).

Mechanical APDL
specifies that a Mechanical APDL file will be used as the output mesh file (extension `.cdb`).

NASTRAN
specifies that a NASTRAN file will be used as the output mesh file (extension `.bdf`).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

PATRAN
specifies that a PATRAN file will be used as the output mesh file (extension `.out`).

File Name
specifies the name of the input mesh file (see the **Output File** descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.

Browse...
opens the *The **Select File** Dialog Box* (p. 33), which you can use to specify the input mesh file instead of entering it in the **Input File** text-entry box.

Include FEA Mesh
includes additional FEA information like node/element information in the exported output file.

Temperature Units
specifies the unit of temperature when mapping temperature for a structural analysis or any variable for a thermal analysis.

Read
reads the input file into memory.

Display
displays the selected mesh in the graphics window.

Write
writes an output file in which the selected ANSYS FLUENT cell data is mapped onto the input mesh file.

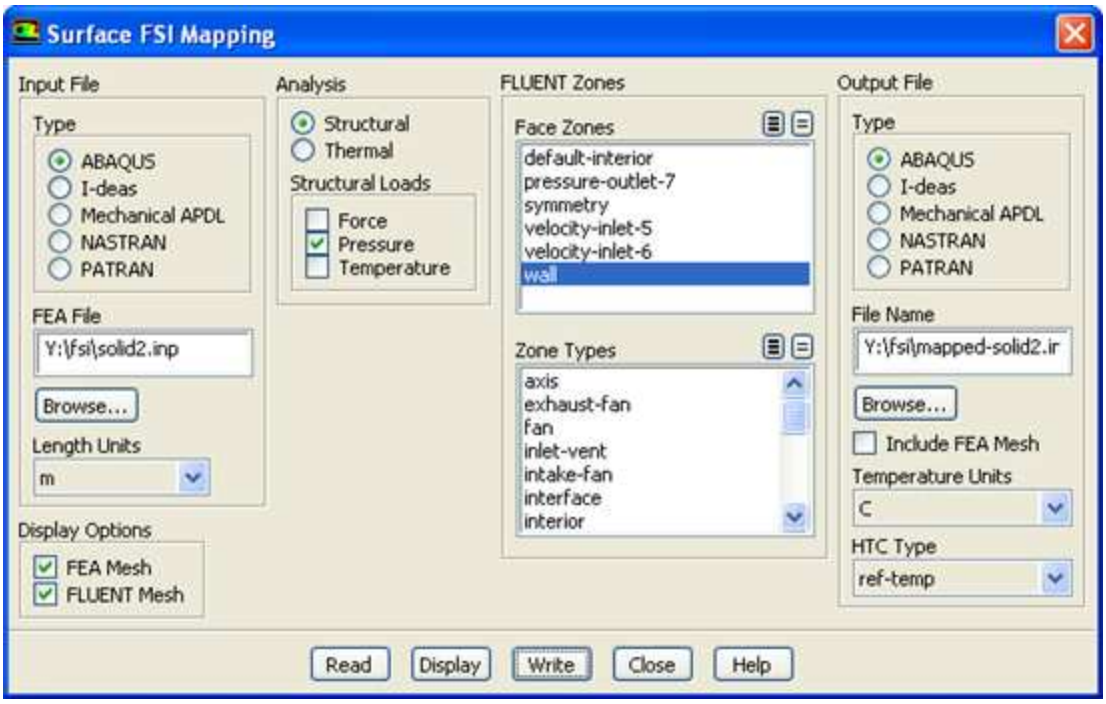
36.1.69. File/FSI Mapping/Surface...

The **File/FSI Mapping/Surface...** menu item opens the *Surface FSI Mapping Dialog Box* (p. 2070).

36.1.69.1. Surface FSI Mapping Dialog Box

The **Surface FSI Mapping** dialog box allows you to map face data for a given geometry from an ANSYS FLUENT file to a file with a different mesh and format. See *Mapping Data for Fluid-Structure Interaction (FSI) Applications* (p. 113) for a complete description of how to use the dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Input File

contains parameters related to the input file.

Type

contains the options for the format of the input mesh file.

ABAQUS

specifies that an ABAQUS file will be used as the input mesh file (extension `.inp`).

I-deas

specifies that an I-deas file will be used as the input mesh file (extension `.unv`).

Mechanical APDL

specifies that a Mechanical APDL file will be used as the input mesh file (extension `.cdb`).

NASTRAN

specifies that a NASTRAN file will be used as the input mesh file (extension `.bdf`).

PATRAN

specifies that a PATRAN file will be used as the input mesh file (extension `.out`).

FEA File

specifies the name of the input mesh file (see the **Input File Type** descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.

Browse...

opens the *The **Select File** Dialog Box* (p. 33), which you can use to specify the input mesh file instead of entering it in the **Input File** text-entry box.

Length Units

specifies the unit of length used in the input file.

Display Options

allows you to choose either the **FEA Mesh** or the **ANSYS FLUENT Mesh** (or both).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Analysis
contains the options for the kind of data to be mapped.

Structural
specifies that data fields relevant for a structural analysis will be mapped.

Thermal
specifies that data fields relevant for a thermal analysis will be mapped.

Structural Loads
consists of a list of available loads, including **Force**, **Pressure**, and **Temperature**.

FLUENT Zones
contains a list of available face zones from the current ANSYS FLUENT file from which cell data will be mapped.

Output File
contains the options for the format of the file that will be created from the input mesh file and the mapped data.

Type
contains the options for the format of the output mesh file.

ABAQUS
specifies that an ABAQUS file will be used as the output mesh file (extension `.inp`).

I-deas
specifies that an I-deas file will be used as the output mesh file (extension `.unv`).

Mechanical APDL
specifies that a Mechanical APDL file will be used as the output mesh file (extension `.cdb`).

NASTRAN
specifies that a NASTRAN file will be used as the output mesh file (extension `.bdf`).

PATRAN
specifies that a PATRAN file will be used as the output mesh file (extension `.out`).

File Name
specifies the name of the input mesh file (see the **Output File** descriptions for associated file extensions). If the file is not in the current working folder, include the full path to the folder where it is located.

Browse...
opens the *The **Select File** Dialog Box* (p. 33), which you can use to specify the input mesh file instead of entering it in the **Input File** text-entry box.

Include FEA Mesh
includes additional FEA information like node/element information in the exported output file.

Temperature Units
specifies the unit of temperature when mapping temperature for a structural analysis or any variable for a thermal analysis.

HTC Type
specifies the means of calculating the heat transfer coefficient.

ref-temp
uses a temperature equal to the reference temperature to calculate the heat transfer coefficient.

cell-temp
uses a temperature equal to the temperature of the cell adjacent to the face to calculate the heat transfer coefficient.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

wall-func-htc

calculates h_{eff} using *Equation 33–55* (p. 1578). Note that this option has the same definition as the field variable **Wall Func. Heat Tran. Coef.**, as described in *Alphabetical Listing of Field Variables and Their Definitions* (p. 1547).

Read

reads the input file into memory.

Display

displays the selected mesh in the graphics window.

Write

writes an output file in which the ANSYS FLUENT data has been mapped to the mesh of the input file.

36.1.70. File/Save Picture...

The **File/Save Picture...** menu item opens the *Save Picture Dialog Box* (p. 1988).

36.1.71. File/Data File Quantities...

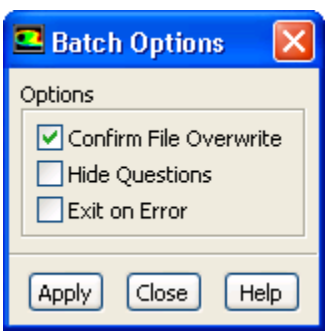
The **File/Data File Quantities...** menu item opens the *Data File Quantities Dialog Box* (p. 1945).

36.1.72. File/Batch Options...

The **File/Batch Options...** menu item opens the *Batch Options Dialog Box* (p. 2073).

36.1.72.1. Batch Options Dialog Box

The **Batch Options** dialog box allows you to select options to suppress interactive dialog boxes from ANSYS FLUENT while running a case in batch mode. See *Batch Execution Options* (p. 16) for details.



Controls

Confirm File Overwrite

determines whether ANSYS FLUENT confirms a file overwrite. This option is enabled by default.

Hide Questions

allows you to hide **Question** dialog boxes. This option is disabled by default.

Exit on Error

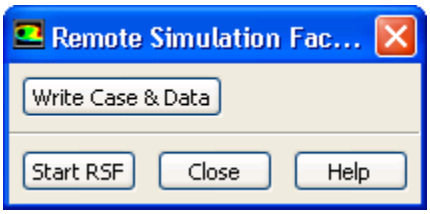
allows you to automatically exit from batch mode when an error occurs. This option is disabled by default.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.1.73. File/RSF...

ANSYS FLUENT's Remote Simulation Facility (RSF) is a highly secure mechanism for executing large, complex simulations at a remote data center.

The **File/RSF...** menu item opens the **Remote Simulation Facility (RSF)** dialog box.



Controls

Write Case & Data
allows you to write case and data files for the current session. You must save the case and data files in order to use them on the RSF. This option is available only after the case and data files are already loaded into ANSYS FLUENT.

Start RSF
opens your web browser and loads the page for the ANSYS FLUENT Remote Simulation Facility.

36.1.74. File/Exit

The **File/Exit** menu item is used to exit from the current solver session.

36.2. Mesh Menu

For additional information, please see the following sections:

36.2.1. Mesh/Check
36.2.2. Mesh/Info/Quality
36.2.3. Mesh/Info/Size
36.2.4. Mesh/Info/Memory Usage
36.2.5. Mesh/Info/Zones
36.2.6. Mesh/Info/Partitions
36.2.7. Mesh/Polyhedra/Convert Domain
36.2.8. Mesh/Polyhedra/Convert Skewed Cells...
36.2.9. Mesh/Merge...
36.2.10. Mesh/Separate/Faces...
36.2.11. Mesh/Separate/Cells...
36.2.12. Mesh/Fuse...
36.2.13. Mesh/Zone/Append Case File...
36.2.14. Mesh/Zone/Append Case & Data Files...
36.2.15. Mesh/Zone/Replace...
36.2.16. Mesh/Zone/Delete...
36.2.17. Mesh/Zone/Deactivate...
36.2.18. Mesh/Zone/Activate...
36.2.19. Mesh/Replace...
36.2.20. Mesh/Reorder/Domain
36.2.21. Mesh/Reorder/Zones
36.2.22. Mesh/Reorder/Print Bandwidth

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.2.23. Mesh/Scale...
36.2.24. Mesh/Translate...
36.2.25. Mesh/Rotate...
36.2.26. Mesh/Smooth/Swap...

36.2.1. Mesh/Check

The **Mesh/Check** menu item is used to verify the validity of the mesh. See *Checking the Mesh* (p. 172) for details.

36.2.2. Mesh/Info/Quality

The **Mesh/Info/Quality** menu item is used to display information about the quality of the mesh in the console, including the minimum orthogonal quality and the maximum aspect ratio. See *Mesh Quality* (p. 144) for details.

36.2.3. Mesh/Info/Size

The **Mesh/Info/Size** menu item is used to print out the number of nodes, faces, cells, and partitions in the mesh. See *Mesh Size* (p. 175) for details.

36.2.4. Mesh/Info/Memory Usage

The **Mesh/Info/Memory Usage** menu item is used to check the amount of memory used and allocated in the present analysis.

This feature reports the following information: the number of nodes, faces, cells, edges, and object pointers (generic pointers for various mesh and graphics utilities) that are used and allocated; the amount of array memory (scratch memory used for surfaces) used and allocated; and the amount of memory used by the solver process.

The memory information will be different for UNIX and Windows systems. See *Memory Usage* (p. 176) for details.

36.2.5. Mesh/Info/Zones

The **Mesh/Info/Zones** menu item is used to print the total number of nodes for each face and cell zone, the number of faces or cells, the cell (and, in 3D, face) type (triangular, quadrilateral, etc.), the boundary condition type, and the zone ID. See *Mesh Zone Information* (p. 177) for details.

36.2.6. Mesh/Info/Partitions

The **Mesh/Info/Partitions** menu item is used to print out mesh partition statistics in the console window. See *Interpreting Partition Statistics* (p. 1622) for details.

Important

This report is the same as the one generated using the **Print Partitions** button in the *Partitioning and Load Balancing Dialog Box* (p. 2161).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.2.7. Mesh/Polyhedra/Convert Domain

The **Mesh/Polyhedra/Convert Domain** menu item is used to convert all 3D meshes (except pure hex meshes) to polyhedral cells. See *Converting the Domain to a Polyhedra* (p. 178) for details.

Important

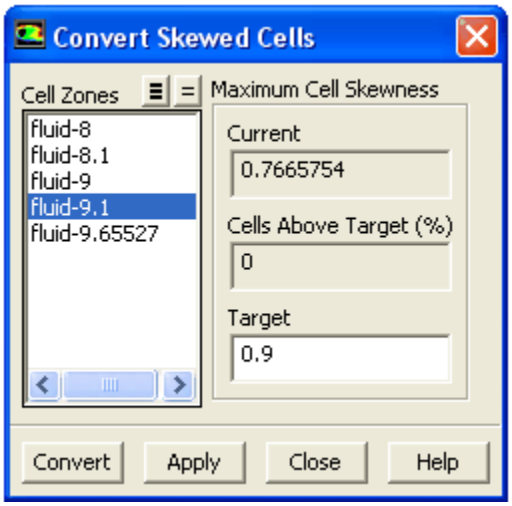
Conversion of a mesh to polyhedra only applies to 3D meshes that contain tetrahedral and/or wedge/prism cells. Hexahedral cells remain unchanged during conversion

36.2.8. Mesh/Polyhedra/Convert Skewed Cells...

The **Mesh/Polyhedra/Convert Skewed Cells...** menu item opens the *Convert Skewed Cells Dialog Box* (p. 2076).

36.2.8.1. Convert Skewed Cells Dialog Box

The **Convert Skewed Cells** dialog box allows you to convert part of your domain to polyhedral cells. See *Replacing, Deleting, Deactivating, and Activating Zones* (p. 195) for details. For information about converting skewed cells see *Using the Convert Skewed Cells Dialog Box* (p. 182).



Controls

Cell Zones
displays the zones that can be selected for cell conversion.

Maximum Cell Skewness
displays the cells skewness parameters of the current mesh.

Current
displays the current maximum cell skewness of the mesh.

Cells Above Target (%)
displays the percentage of cells which are above the **Target** skewness.

Important

The **Cells Above Target (%)** should be only a couple of percentage points, else the conversion will be ineffective due to the high face count.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Target
allows you to specify the maximum allowable cell skewness.

Important

To update the **Cells Above Target** (%) Press `<Enter>` after entering **Target** value.

Convert
converts the selected zones to polyhedral cells.

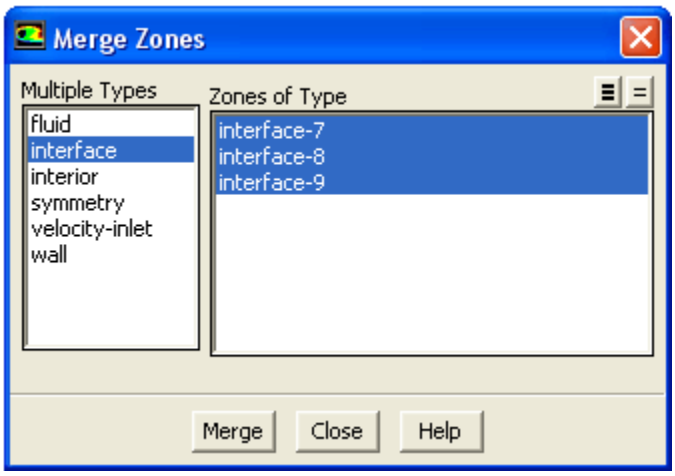
Apply
saves the value entered for **Target**.

36.2.9. Mesh/Merge...

The **Mesh/Merge...** menu item opens the *Merge Zones Dialog Box* (p. 2077).

36.2.9.1. Merge Zones Dialog Box

The **Merge Zones** dialog box allows you to merge multiple zones of the same type into a single zone. See *Merging Zones* (p. 184) for details.



Controls

Multiple Types
contains a selectable list of the zone types for which you can merge multiple zones. You select a type and the corresponding zones of that type will be displayed in the **Zones of Type** list.

Zones of Type
contains a list from which you can select two or more zones to be merged into a single zone. The zones are of the type selected in the **Multiple Types** list.

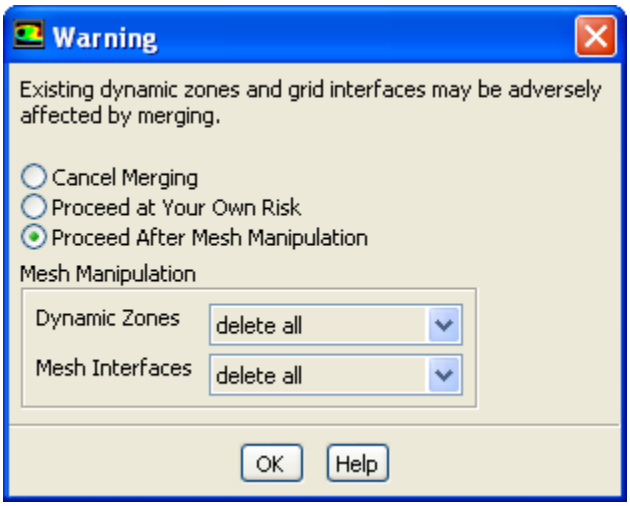
Merge
merges the selected zones into a single zone. If your case file has dynamic zones or mesh interfaces, the **Warning** dialog box will open and require your input prior to the merge.

36.2.9.2. Warning Dialog Box

The **Warning** dialog box allows you to specify whether existing dynamic zones and/or mesh interfaces are deleted when you are using the **Merge Zones** dialog box to merge multiple zones of the same type into a

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

single zone (see *Merge Zones Dialog Box* (p. 2077) for details). Note that dynamic zones and mesh interfaces that exist at the time of the merge may be adversely affected by the merge.



Controls

Cancel Merging
returns you to the **Mesh Zones** dialog box when you click **OK**, without initiating the merge.

Proceed at Your Own Risk
allows the merge to proceed when you click **OK**, without deleting the existing dynamic zones and mesh interfaces beforehand.

Proceed After Mesh Manipulation
deletes the existing dynamic zones and/or mesh interfaces (based on the settings in the **Mesh Manipulation** group box) and then merges the zones when you click **OK**.

Mesh Manipulation
allows you to specify whether the existing dynamic zones and/or mesh interfaces are deleted prior to the initiation of the merge. This group box is only available when **Proceed After Mesh Manipulation** is selected.

Dynamic Zones
specifies whether all existing dynamic zones are deleted prior to the merge.

Mesh Interfaces
specifies whether all existing mesh interfaces are deleted prior to the merge.

Note that selecting **keep all** from both drop-down lists in the **Mesh Manipulation** group box is the equivalent of selecting **Proceed at Your Own Risk**.

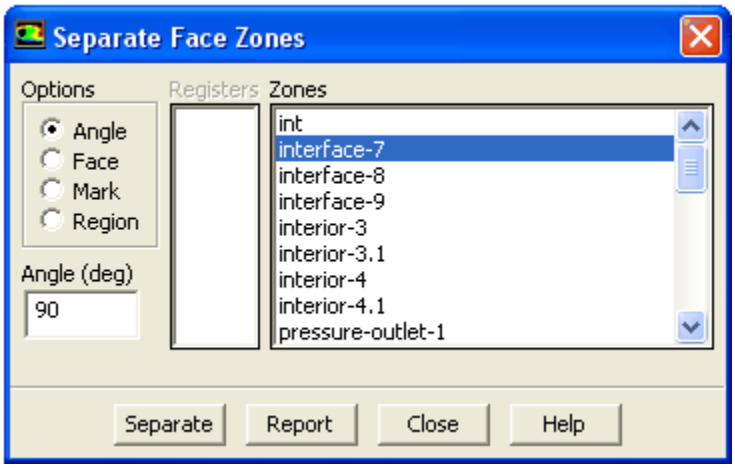
36.2.10. Mesh/Separate/Faces...

The **Mesh/Separate/Faces...** menu item opens the *Separate Face Zones Dialog Box* (p. 2078).

36.2.10.1. Separate Face Zones Dialog Box

The **Separate Face Zones** dialog box allows you to separate a single face zone into multiple zones of the same type. See *Separating Zones* (p. 185) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

specifies the method on which the face separation is to be based.

Angle

indicates that the face zone is to be separated based on significant angle (specified in the **Angle** field).

Face

indicates that the face zone is to be separated by putting each face in the zone into its own zone.

Mark

indicates that the face zone is to be separated based on the marks stored in adaption registers.

Region

indicates that the face zone is to be separated based on contiguous regions.

Registers

contains a list of defined adaption registers. If you are separating faces by mark, select the adaption register to be used in the **Registers** list. When the separation is performed, all faces of cells that are marked will be placed into a new face zone.

Zones

contains a list of face zones from which you can select the zone to be separated.

Angle

specifies the significant angle to be used when you separate a face zone based on angle. Faces with normal vectors that differ by an angle greater than or equal to the specified significant angle will be placed in different zones when the separation occurs.

Separate

separates the selected face zone based on the specified parameters.

Report

reports what the result of the separation will be without actually separating the face zone.

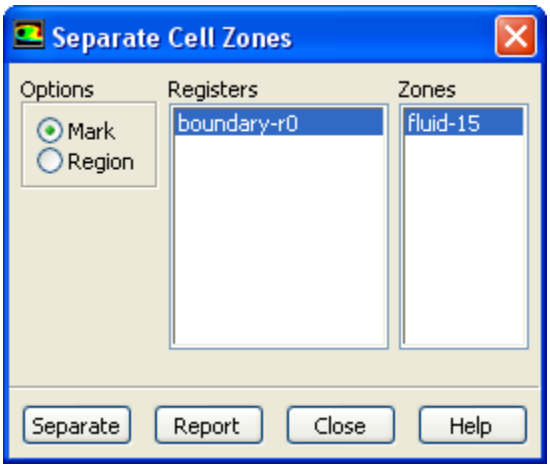
36.2.11. Mesh/Separate/Cells...

The **Mesh/Separate/Cells...** menu item opens the *Separate Cell Zones Dialog Box* (p. 2080).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.2.11.1. Separate Cell Zones Dialog Box

The **Separate Cell Zones** dialog box allows you to separate a single cell zone into multiple zones of the same type. See *Separating Zones* (p. 185) for details.



Controls

Options
specifies the method on which the cell-zone separation is to be based.

Mark
indicates that the cell zone is to be separated based on the marks stored in adaption registers.

Region
indicates that the cell zone is to be separated into two or more contiguous regions based on an internal boundary within the original zone.

Registers
contains a list of defined adaption registers. If you are separating the cell zone by mark, select the adaption register to be used in the **Registers** list. When the separation is performed, cells that are marked will be placed into a new zone.

Zones
contains a list of cell zones from which you can select the zone to be separated.

Separate
separates the selected cell zone based on the specified parameters.

Report
reports what the result of the separation will be without actually separating the cell zone.

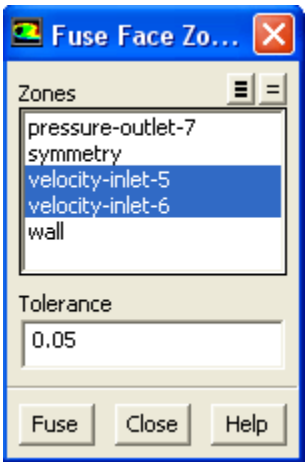
36.2.12. Mesh/Fuse...

The **Mesh/Fuse...** menu item opens the *Fuse Face Zones Dialog Box* (p. 2080).

36.2.12.1. Fuse Face Zones Dialog Box

The **Fuse Face Zones** dialog box allows you to fuse boundaries (i.e., remove duplicate nodes and faces and delete artificial internal boundaries) created by assembling multiple mesh regions. (See *Reading Multiple Mesh/Case/Data Files* (p. 157) for details on importing such meshes.) See *Fusing Face Zones* (p. 190) for information about using this dialog box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Zones
contains a list of face zones from which you can select the boundaries to be fused.

Tolerance
is a fraction of the minimum edge length of the face, used to determine whether or not nodes are coincident. If all of the appropriate faces do not get fused using the default **Tolerance**, you should increase it and attempt to fuse the zones again. The **Tolerance** should not exceed 0.5, or you may fuse the wrong nodes.

Fuse
fuses the selected zones. It is enabled only when you have selected a minimum of two zones.

36.2.13. Mesh/Zone/Append Case File...

The **Mesh/Zone/Append Case File...** menu item opens the **Select File** dialog box. This allows you to handle more than one mesh at a time within the same solver settings. See *Reading Multiple Mesh/Case/Data Files* (p. 157) for details.

36.2.14. Mesh/Zone/Append Case & Data Files...

The **Mesh/Zone/Append Case & Data Files...** menu item opens the **Select File** dialog box. This allows you to append data on the mesh. See *Reading Multiple Mesh/Case/Data Files* (p. 157) for details.

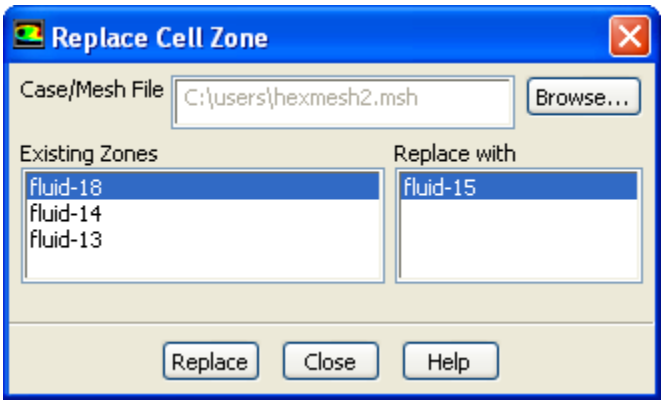
36.2.15. Mesh/Zone/Replace...

The **Mesh/Zone/Replace...** menu item opens the *Replace Cell Zone Dialog Box* (p. 2081)

36.2.15.1. Replace Cell Zone Dialog Box

The **Replace Cell Zone** dialog box allows you to replace a single cell zone or multiple zones. See *Replacing, Deleting, Deactivating, and Activating Zones* (p. 195) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Case/Mesh File
allows you to specify a mesh file from which you want to replace the zone.

Existing Zones
contains a list of cell zones from which you can select the zone to be replaced.

Replace with
contains a list of cell zones from which you can select the zone to replace the zone selected in **Existing Zones** list.

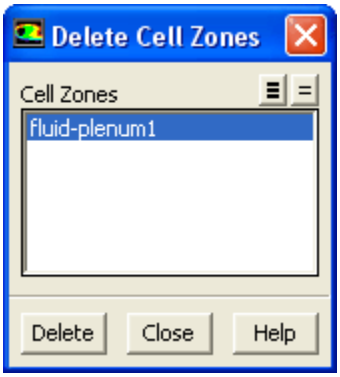
Replace
replaces the selected cell zone.

36.2.16. Mesh/Zone/Delete...

The **Mesh/Zone/Delete...** menu item opens the *Delete Cell Zones Dialog Box* (p. 2082)

36.2.16.1. Delete Cell Zones Dialog Box

The **Delete Cell Zones** dialog box allows you to delete a single cell zone or multiple zones. See *Replacing, Deleting, Deactivating, and Activating Zones* (p. 195) for details.



Controls

Cell Zones
contains a list of cell zones from which you can select the zone to be deleted.

Delete
deletes the selected cell zones.

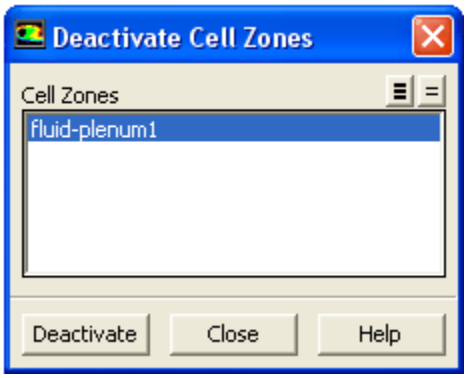
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.2.17. Mesh/Zone/Deactivate...

The **Mesh/Zone/Deactivate...** menu item opens the *Deactivate Cell Zones Dialog Box* (p. 2083).

36.2.17.1. Deactivate Cell Zones Dialog Box

The **Deactivate Cell Zones** dialog box allows you to deactivate a single cell zone or multiple zones. See *Replacing, Deleting, Deactivating, and Activating Zones* (p. 195) for details.



Controls

Cell Zones
contains a list of cell zones from which you can select the zone to be deactivated.

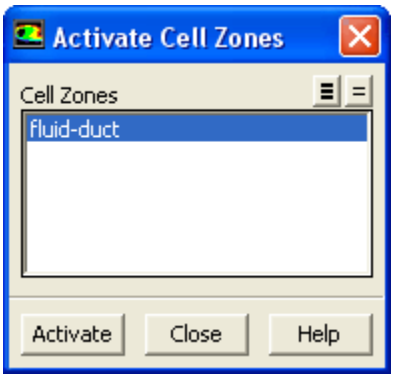
Deactivate
deactivates the selected cell zones.

36.2.18. Mesh/Zone/Activate...

The **Mesh/Zone/Activate...** menu item opens the *Activate Cell Zones Dialog Box* (p. 2083).

36.2.18.1. Activate Cell Zones Dialog Box

The **Activate Cell Zones** dialog box allows you to activate a single cell zone or multiple zones. See *Replacing, Deleting, Deactivating, and Activating Zones* (p. 195) for details.



Controls

Cell Zones
contains a list of cell zones from which you can select the zone to be activated.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Activate
activates the selected cell zones.

36.2.19. Mesh/Replace...

The **Mesh/Replace...** menu item is used to replace the global mesh by reading an ANSYS FLUENT mesh (`.msh`) file. If applicable, data will be interpolated onto the new mesh. See *Replacing the Mesh* (p. 198) for details.

The **Mesh/Replace...** menu item opens the **Select File** dialog box (see *The **Select File** Dialog Box* (p. 33)), which allows you to select the appropriate file to be read.

36.2.20. Mesh/Reorder/Domain

The **Mesh/Reorder/Domain** menu item will reorder the nodes, faces, and cells along zones and in memory in order to increase memory access efficiency. See *Reordering the Domain and Zones* (p. 199) for details.

36.2.21. Mesh/Reorder/Zones

The **Mesh/Reorder/Zones** menu item will reorder the zones first by type and then by ID, for user-interface convenience. See *Reordering the Domain and Zones* (p. 199) for details.

36.2.22. Mesh/Reorder/Print Bandwidth

The **Mesh/Reorder/Print Bandwidth** menu item is used to print the semi-bandwidth and maximum memory distance for each mesh partition. See *Reordering the Domain and Zones* (p. 199) for details.

36.2.23. Mesh/Scale...

The **Mesh/Scale...** menu item opens the *Scale Mesh Dialog Box* (p. 1634).

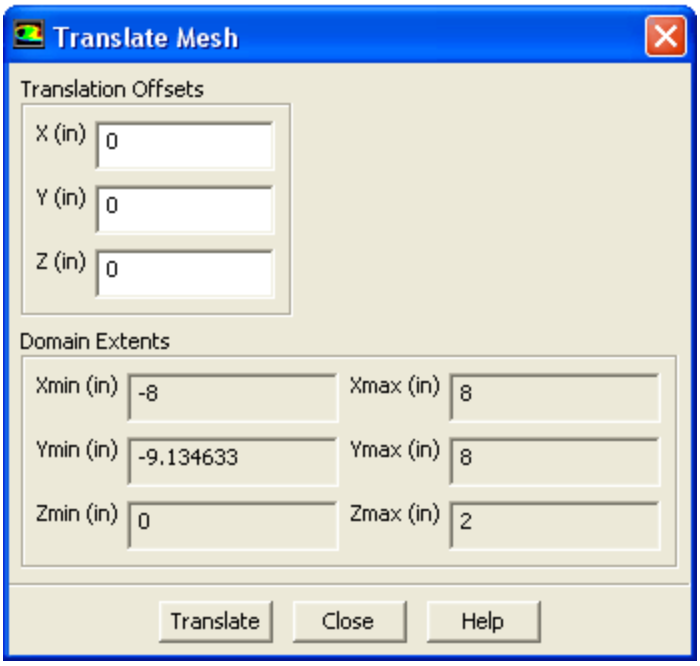
36.2.24. Mesh/Translate...

The **Mesh/Translate...** menu item opens the *Translate Mesh Dialog Box* (p. 2084).

36.2.24.1. Translate Mesh Dialog Box

The **Translate Mesh** dialog box allows you to change the origin of the mesh. See *Translating the Mesh* (p. 202) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Translation Offsets

contains the desired changes in the mesh coordinates (i.e., the desired delta in the axes origin). You can enter a positive or negative real number.

X,Y,Z

defines the deltas in the x, y, and z directions, in the current units of length.

Domain Extents

displays the Cartesian coordinate extremes of the nodes in the mesh. (These values are not editable; they are purely informational.)

Xmin, Ymin, Zmin

shows the minimum values of Cartesian coordinates in the mesh.

Xmax, Ymax, Zmax

shows the maximum values of Cartesian coordinates in the mesh.

Translate

adds the specified translation offsets to the appropriate Cartesian coordinate of every node in the mesh.

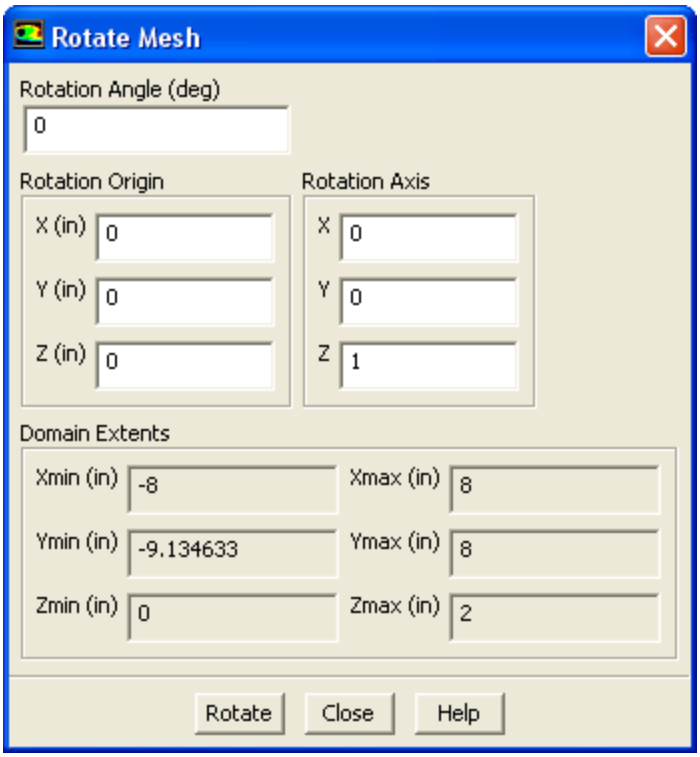
36.2.25. Mesh/Rotate...

The **Mesh/Rotate...** menu item opens the *Rotate Mesh Dialog Box* (p. 2085).

36.2.25.1. Rotate Mesh Dialog Box

The **Rotate Mesh** dialog box allows you to rotate the mesh about the required axis and rotation origin by specifying the angle of rotation. See *Rotating the Mesh* (p. 203) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Rotation Angle
is the angle with which you want to rotate the mesh. You can enter a positive or negative real number.

Rotation Origin
defines the new origin for the mesh rotation.

Rotation Axis
defines the axis about which you want to rotate the mesh.

Domain Extents
displays the Cartesian coordinate extremes of the nodes in the mesh. (These values are not editable; they are purely informational.)

Rotate
adds the specified rotation parameters to the appropriate Cartesian coordinate of every node in the mesh.

36.2.26. Mesh/Smooth/Swap...

The **Mesh/Smooth/Swap...** menu item opens the *Smooth/Swap Mesh Dialog Box* (p. 2135), which controls smoothing and diagonal swapping. See *Improving the Mesh by Smoothing and Swapping* (p. 1349) for details about its use.

36.3. Define Menu

For additional information, please see the following sections:

36.3.1. Define/General...
36.3.2. Define/Models...
36.3.3. Define/Materials...

36.3.1. Define/General...

The **Define/General...** menu item opens the *General Task Page* (p. 1631).

36.3.2. Define/Models...

The **Define/Models...** menu item opens the *Models Task Page* (p. 1639).

36.3.3. Define/Materials...

The **Define/Materials...** menu item opens the *Materials Task Page* (p. 1735).

36.3.4. Define/Phases...

The **Define/Phases...** menu item opens the *Phases Task Page* (p. 1783).

36.3.5. Define/Cell Zone Conditions...

The **Define/Cell Zone Conditions...** menu item opens the *Cell Zone Conditions Task Page* (p. 1794).

36.3.6. Define/Boundary Conditions...

The **Define/Boundary Conditions...** menu item opens the *Boundary Conditions Task Page* (p. 1812).

36.3.7. Define/Operating Conditions...

The **Define/Operating Conditions...** menu item opens the *Operating Conditions Dialog Box* (p. 1806).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.3.8. Define/Mesh Interfaces...

The **Define/Mesh Interfaces...** menu item opens the *Mesh Interfaces Task Page* (p. 1875).

36.3.9. Define/Dynamic Mesh...

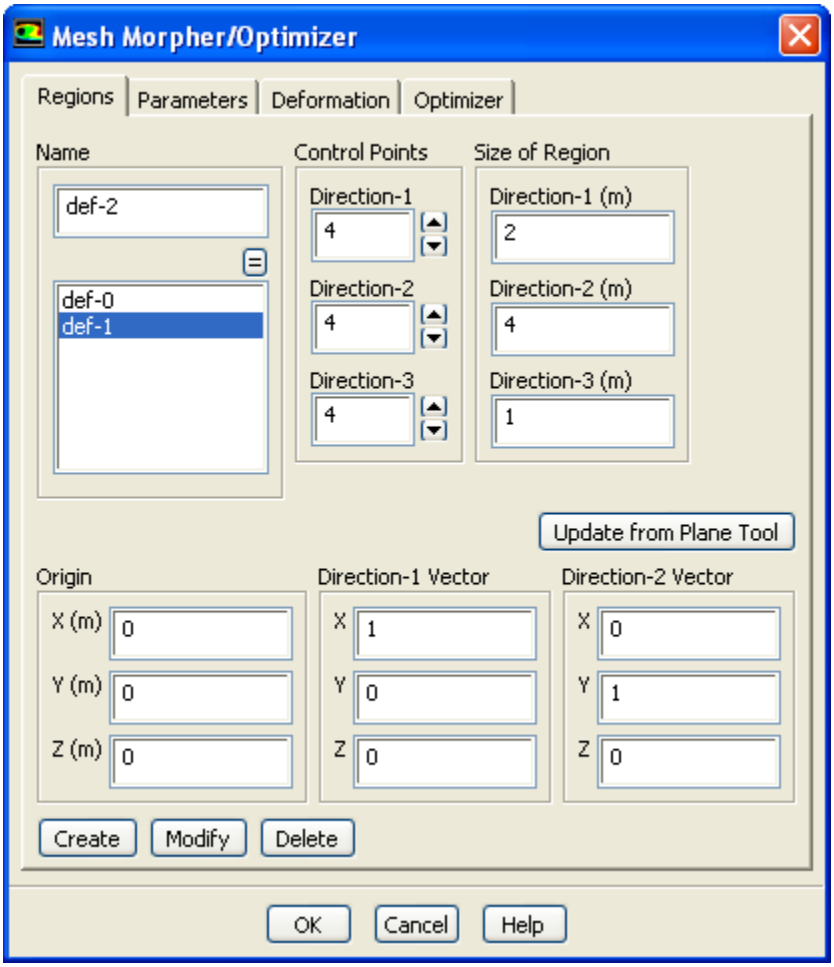
The **Define/Dynamic Mesh...** menu item opens the *Dynamic Mesh Task Page* (p. 1877).

36.3.10. Define/Mesh Morpher/Optimizer...

The **Define/Mesh Morpher/Optimizer...** menu item opens the *Mesh Morpher/Optimizer Dialog Box* (p. 2088).

36.3.10.1. Mesh Morpher/Optimizer Dialog Box

The **Mesh Morpher/Optimizer** dialog box allows you to use the mesh morpher/optimizer to deform the mesh in order to solve shape optimization problems. You can deform the mesh manually, or allow an in-built optimizer to define the deformation in order to minimize an objective function. See *Setting Up the Mesh Morpher/Optimizer* (p. 634) for further details.



Controls

Regions

tab allows you to define the regions of the domain where the mesh will be deformed in order to optimize the shape.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Name

provides controls for the deformation regions you are defining. The upper text-entry box defines the name of the region that is created when you click the **Create** button. The lower selection list allows you to select a region that has already been created, in order to display it in the graphics window, modify the settings via the **Modify** button, or delete the region via the **Delete** button.

Control Points

allows you to define the number of control points for each axis of the deformation region. The number of control points must be the same for all regions in each direction.

Direction-1

defines the number of control points for the deformation region along the direction specified by the **Direction-1 Vector** group box.

Direction-2

defines the number of control points for the deformation region along the direction specified by the **Direction-2 Vector** group box.

Direction-3

defines the number of control points for the deformation region along the third axis (i.e., the cross product of the vectors defined by the **Direction-1 Vector** and **Direction-2 Vector** group boxes). This number-entry box is only available for 3D cases.

Size of Region

allows you to define the overall dimensions of the deformation region.

Direction-1

defines the length of the deformation region along the direction specified by the **Direction-1 Vector** group box.

Direction-2

defines the length of the deformation region along the direction specified by the **Direction-2 Vector** group box.

Direction-3

defines the length of the deformation region along the third axis (i.e., the cross product of the vectors defined by the **Direction-1 Vector** and **Direction-2 Vector** group boxes). This number-entry box is only available for 3D cases.

Origin

allows you to define the Cartesian coordinates of the origin of the deformation region.

X

defines the *x* coordinate of the origin of the deformation region.

Y

defines the *y* coordinate of the origin of the deformation region.

Z

defines the *z* coordinate of the origin of the deformation region. This number-entry box is only available for 3D cases.

Update from Plane Tool

updates the values in the **Direction-1 Vector** and **Direction-2 Vector** group boxes based on the settings in the plane tool. See *Using the Plane Tool* (p. 1367) for information about the plane tool. This button is only available for 3D cases.

Update from Line Tool

updates the values in the **Direction-1 Vector** and **Direction-2 Vector** group boxes based on the settings in the line tool. See *Using the Line Tool* (p. 1363) for information about the line tool. This button is only available for 2D cases.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Direction-1 Vector

allows you to define a vector that acts as the first direction of the deformation region relative to the **Origin**.

X

defines the *x* component of the first direction vector of the deformation region.

Y

defines the *y* component of the first direction vector of the deformation region.

Z

defines the *z* component of the first direction vector of the deformation region. This number-entry box is only available for 3D cases.

Direction-2 Vector

defines a vector that is used to calculate the second direction of the deformation region relative to the **Origin**. For 2D cases, the values in the **Direction-2 Vector** group box are automatically defined by ANSYS FLUENT to be perpendicular to the **Direction-1 Vector**. For 3D cases, the vector defined by the **Direction-2 Vector** group box is projected onto a plane that intersects the **Origin** and is perpendicular to the vector defined in the **Direction-1 Vector** group box, in order to calculate the second direction.

X

defines the *x* component of the vector used to calculate the second direction of the deformation region. This number-entry box is only editable for 3D cases.

Y

defines the *y* component of the vector used to calculate the second direction of the deformation region. This number-entry box is only editable for 3D cases.

Z

defines the *z* component of the vector used to calculate the second direction of the deformation region. This number-entry box is only available for 3D cases.

Create

creates a new deformation region with the name specified in the upper text-entry box of the **Name** group box and with the settings defined in the **Control Points**, **Size of Region**, **Origin**, **Direction-1 Vector**, and **Direction-2 Vector** group boxes. The newly created deformation region will be added to and selected in the lower **Name** selection list, and will be displayed in the graphics window.

Modify

modifies the saved settings for the deformation region selected in the lower **Name** selection list and displays the modified region in the graphics window.

Delete

deletes the deformation region selected in the lower **Name** selection list.

Parameters

tab allows you to set the parameters for deformation.

Number of Parameters

defines the number of parameters available to be assigned to control points.

Parameter Index

specifies the index of the parameter whose value is displayed in the **Value** number-entry box. Note that the first parameter has an index of **0**.

Value

defines a magnitude of deformation for the parameter specified in the **Parameter Index** number-entry box when the **Apply** button is clicked. The product of the **Value** and the settings specified in the **Scaling Factors** group box of the **Deformation** tab defines the displacement of a control point

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

during manual deformation. This number-entry box is only editable when **none** is selected from the **Optimizer** drop-down list in the **Optimizer** tab.

Apply
saves the **Value** you entered for the parameter specified in the **Parameter Index** number-entry box.

Deform
modifies the mesh and updates the mesh display in the graphics window based on the settings saved in the **Parameters** and **Deformation** tabs. This button is only available when **none** is selected from the **Optimizer** drop-down list in the **Optimizer** tab.

Check
displays a mesh check report in the console for the mesh displayed in the graphics window. This button is only available when **none** is selected from the **Optimizer** drop-down list in the **Optimizer** tab. The mesh check report provides volume statistics, mesh topology and periodic boundary information, verification of simplex counters, and verification of node position with reference to the x axis for axisymmetric cases, in the same manner as the **Check** button in the **General** task page (see *Checking the Mesh* (p. 172) for details).

Deformation
tab allows you to assign deformation parameters to control points.

Region
selects the deformation region for which you are assigning deformation parameters to control points.

Control Point
defines the control point to which you are assigning deformation parameters.

Probe
allows you to specify the **Control Point** by clicking in the graphics window with the **mouse-probe** button of the mouse.

Parameter Index
specifies the index number of the deformation parameter you are assigning to the **Control Point**. Note that the first parameter has an index of **0**.

Scaling Factors
allows you to define coefficients in the *x*, *y*, and (for 3D cases) *z* directions to scale the magnitude of deformation for a given parameter. If you use an in-built optimizer, these coefficients provide the direction of the displacement of the control point and the optimizer determines the overall magnitude of displacement. Alternatively, if you manually specify the deformation, the values you enter in the **Scaling Factors** group box are multiplied with the **Value** specified in the **Parameters** tab to define the displacement of the control point.

X
defines the scaling coefficient applied to the deformation parameter in the *x* direction.

Y
defines the scaling coefficient applied to the deformation parameter in the *y* direction.

Z
defines the scaling coefficient applied to the deformation parameter in the *z* direction. This number-entry box is only available for 3D cases.

Apply
saves the values entered in the **Scaling Factor** group box for the parameter specified in the **Parameter Index** number-entry box, and assigns this parameter to the control point displayed in the **Control Point** number-entry box.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Deform

modifies the mesh and updates the mesh display in the graphics window based on the settings saved in the **Parameters** and **Deformation** tabs. This button is only available when **none** is selected from the **Optimizer** drop-down list in the **Optimizer** tab.

Check

displays a mesh check report in the console for the mesh displayed in the graphics window. This button is only available when **none** is selected from the **Optimizer** drop-down list in the **Optimizer** tab. The mesh check report provides volume statistics, mesh topology and periodic boundary information, verification of simplex counters, and verification of node position with reference to the x axis for axisymmetric cases, in the same manner as the **Check** button in the **General** task page (see *Checking the Mesh* (p. 172) for details).

Reset

undoes any modifications made to the mesh as a result of the **Deform** button and updates the mesh display in the graphics window.

Optimizer

tab allows you to define the settings for the optimizer.

Optimizer

specifies which optimizer is used. The choices include **none** (for manual deformation), **compass**, **powell**, **rosenbrock**, **simplex**, and **torczon**. For information about how the optimizers function, see *Optimizers* (p. 632).

Objective Function Definition

allows you to specify the format in which you have provided the objective function that will be minimized during the optimization process. This group box is not available if **none** is selected from the **Optimizer** drop-down list.

User-Defined Function

specifies that the objective function that will be minimized during the optimization process is provided via a user-defined function.

Scheme Procedure

specifies that the objective function that will be minimized during the optimization process is provided via a Scheme source file.

Optimizer Settings

allows you to specify the optimizer settings. This group box is not available if **none** is selected from the **Optimizer** drop-down list.

Maximum Number of Designs

defines the maximum number of design stages the optimizer will undergo to reach the specified objective function.

Number of Iterations

defines the maximum number of iterations ANSYS FLUENT will perform for each design change.

Optimizer Convergence Criteria

defines the convergence criteria for the optimizer.

Initialization

allows you to specify how the solution variables should be treated after the mesh is deformed during the optimization process. This group box is not available if **none** is selected from the **Optimizer** drop-down list.

Initialize Data After Morphing

specifies that the solution variables should be initialized to the values defined in the **Solution Initialization** task page after deformation.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Continue with Current Data
specifies that the solution variables should remain the values obtained in the previous design iteration.

Apply
saves the settings in the **Optimizer** tab.

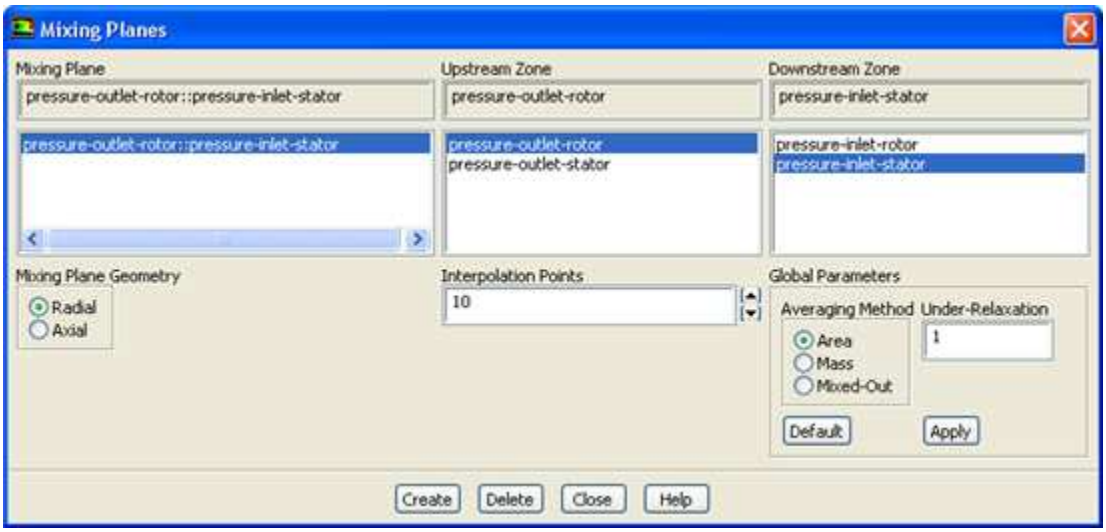
Optimize
initiates the optimization process using the settings saved in all of the tabs of the **Mesh Morpher/Optimizer** dialog box. This button is not available if **none** is selected from the **Optimizer** drop-down list.

36.3.11. Define/Mixing Planes...

The **Define/Mixing Planes...** menu item opens the *Mixing Planes Dialog Box* (p. 2093).

36.3.11.1. Mixing Planes Dialog Box

The **Mixing Planes** dialog box allows you to define the mixing planes for a mixing plane model. See *Setting Up the Mixing Plane Model* (p. 528) for details about using the items below.



Controls

Mixing Plane
contains a list from which you can select an existing mixing plane, and an informational field in which ANSYS FLUENT displays the name of the currently selected (or most recently created) mixing plane.

Upstream Zone, Downstream Zone
contain lists from which you can select the boundaries on the upstream and downstream sides of the mixing plane, and informational fields that show the names of the zone you selected in each list. (You cannot edit these fields; the name in each field will be the name of the zone you selected in the list below it.)

Interpolation Points
specifies the number of radial or axial locations used in constructing the boundary profiles for circumferential averaging. This item appears only in 3D.

Mixing Plane Geometry
defines the geometry of the mixing plane interface. This item appears only in 3D.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Radial
specifies that information at the mixing plane interface is to be circumferentially averaged into profiles that vary in the radial direction, e.g., $p(r)$, $T(r)$.

Axial
specifies that circumferentially averaged profiles are to be constructed that vary in the axial direction, e.g., $p(x)$, $T(x)$.

Global Parameters
contains parameters related to the mixing plane calculation.

Averaging Method
consists of three profile averaging methods.

Area
is the default method and is expressed using Equation 2–17 in the Theory Guide.

Mass
provides better representation of the total quantities than the area averaging method. It is defined by Equation 2–18 of the Theory Guide.

Mixed-Out
is most representative of non-uniform flow profiles and is expressed using Equation 2–20 in the Theory Guide.

Under-Relaxation
specifies the under-relaxation factor for updating the boundary values at mixing planes.

Apply
sets the specified **Under-Relaxation**.

Default
sets the **Under-Relaxation** to its default value, as assigned by ANSYS FLUENT. After execution, the **Default** button becomes the **Reset** button.

Reset
resets the **Under-Relaxation** to its most recently saved value (i.e., the value before **Default** was selected). After execution, the **Reset** button becomes the **Default** button.

Create
creates the specified mixing plane (and assigns it a name in the **Mixing Plane** field).

Delete
deletes the mixing plane selected under **Mixing Plane**.

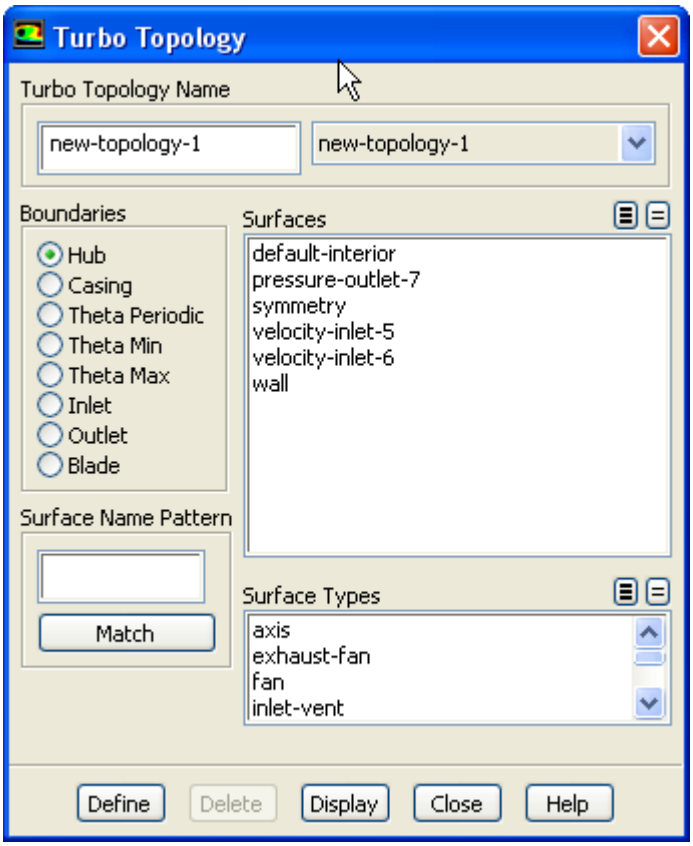
36.3.12. Define/Turbo Topology...

The **Define/Turbo Topology...** menu item opens the *Turbo Topology Dialog Box* (p. 2094).

36.3.12.1. Turbo Topology Dialog Box

The **Turbo Topology** dialog box allows you to define the topology for a turbomachinery application, so that you can use the turbomachinery-specific postprocessing features described in *Turbomachinery Postprocessing* (p. 1483). See *Defining the Turbomachinery Topology* (p. 1484) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Turbo Topology Name

specifies the name of the new topology.

Boundaries

contains radio buttons for the topology boundaries to be defined.

Hub

specifies the definition for the wall zone(s) forming the lower boundary of the flow passage (generally toward the axis of rotation of the machine).

Casing

specifies the definition of the wall zone(s) forming the upper boundary of the flow passage (away from the axis of rotation of the machine).

Theta Periodic

specifies the definition of the periodic boundary zone(s) on the circumferential boundaries of the flow passage.

Theta Min, Theta Max

specify the definition of the wall zones at the minimum and maximum angular (θ) positions on a circumferential boundary.

Inlet

specifies the definition of the inlet zone(s) through which the flow enters the passage.

Outlet

specifies the definition of the outlet zone(s) through which the flow exits the passage.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Blade
specifies the definition of the wall zone(s) that defines the blade(s) (if any). Note that these zones cannot be attached to the circumferential boundaries. For this situation, use **Theta Min** and **Theta Max** to define the blade.

Surfaces
contains a selectable list of the available surfaces, from which you can select the surface(s) that represent the boundary selected under **Boundaries**.

Surface Name Pattern
specifies the pattern to look for in the names of surfaces. Type the pattern in the text field and click **Match** to select (or deselect) the zones in the **Surfaces** list with names that match the specified pattern. See *Defining the Turbomachinery Topology* (p. 1484) for information about matching additional characters using * and ?.

Surface Types
contains a selectable list of types of surfaces. If you select (or deselect) an item in this list, all surfaces of that type will be selected (or deselected) automatically in the **Surfaces** list.

Define
defines the new topology. If you have selected an existing topology the **Define** button is replaced by the **Modify** button.

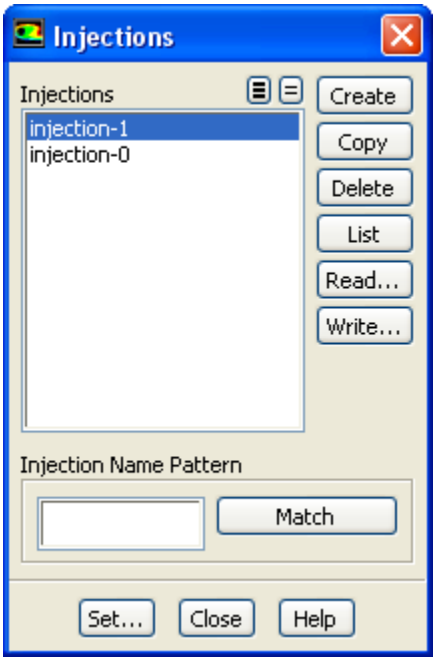
Display
draws the defined topology in the active graphics window.

36.3.13. Define/Injections...

The **Define/Injections...** menu item opens the *Injections Dialog Box* (p. 2096).

36.3.13.1. Injections Dialog Box

The **Injections** dialog box allows you to create, delete, and list discrete phase injections, and access the *Set Injection Properties Dialog Box* (p. 2097) and the *Set Multiple Injection Properties Dialog Box* (p. 2101), in which you can set the properties for the injections. See *Creating and Modifying Injections* (p. 1038) for details.



Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Injections
contains a list from which you can select one or more injections in order to set, copy, or modify properties, or delete or list injections.

Create
creates a new injection and opens the *Set Injection Properties Dialog Box* (p. 2097), in which you can set its properties.

Copy
creates a new injection with the same properties as the selected injection and opens the *Set Injection Properties Dialog Box* (p. 2097) where the new injection's properties can be modified.

Delete
deletes the injection(s) selected in the **Injections** list.

List
lists the initial conditions for the particle streams in the injection(s) selected in the **Injections** list.

Read...
opens the *The **Select File** Dialog Box* (p. 33) where you will select the injection file to read in.

Write...
allows you to select the injection from the list and write it to a file.

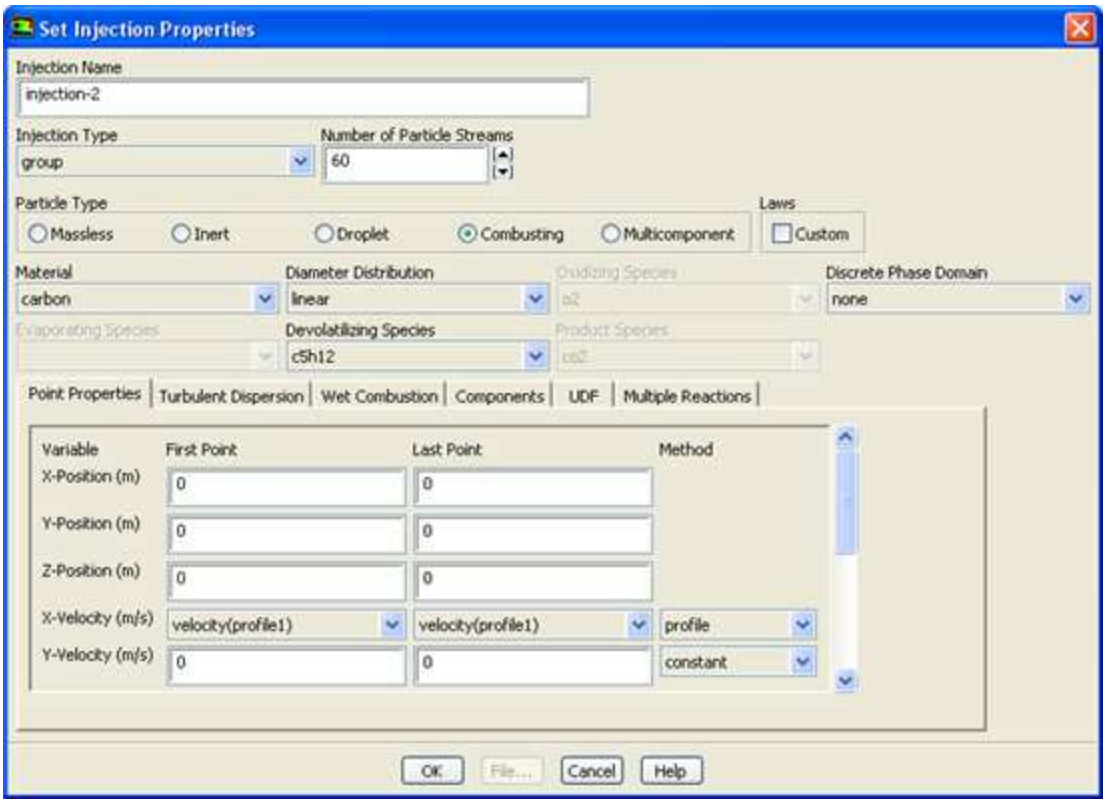
Injection Name Pattern
specifies the pattern to look for in the names of injections. Type the pattern in the text field and click **Match** to select (or deselect) the injections in the **Injections** list with names that match the specified pattern. See *Shortcuts for Selecting Injections* (p. 1040) for information about matching additional characters using * and ?.

Set...
opens the *Set Injection Properties Dialog Box* (p. 2097) for the injection selected in the **Injections** list or the *Set Multiple Injection Properties Dialog Box* (p. 2101) if more than one injection is selected in the **Injections** list.

36.3.13.2. Set Injection Properties Dialog Box

The **Set Injection Properties** dialog box allows you to define the properties of an existing discrete-phase injection (which was created in the *Injections Dialog Box* (p. 2096)). This dialog box is opened from the **Injections** dialog box. See *Defining Injection Properties* (p. 1040) for details about the items listed in this section.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Injection Name

sets the name of the injection.

Injection Type

contains a drop-down list of the available injection types: **single**, **group**, **cone**, **solid-cone**, **surface**, **plain-orifice-atomizer**, **pressure-swirl-atomizer**, **air-blast-atomizer**, **flat-fan-atomizer**, **effervescent-atomizer**, and **file**. (**cone** is not available in 2D.) These choices are described in *Injection Types* (p. 1024).

Number of Particle Streams

indicates the number of particle streams in a **group** or **cone**injection. (This item will not appear for **single**, **surface**, or **file** injections.)

Release From Surfaces

indicates the surface from which the particles in a **surface** injection will be released. (This item will appear only for a **surface** injection.)

Particle Type

specifies the particle type as **Massless**, **Inert**, **Droplet**, **Combusting**, or **Multicomponent**. These types are described in *Particle Types* (p. 1025).

Laws

(not for massless particles) contains inputs for customized particle laws.

Custom

enables the specification of customized particle laws and opens the *Custom Laws Dialog Box* (p. 2102).

Material

(not for massless particles) indicates the material for the particles. If this is the first time you have created a particle of this type, you can choose from all of the materials by copying them from the database or creating them from scratch, as discussed in *Setting Discrete-Phase Physical Properties* (p. 1057) and described in detail in *Using the Materials Task Page* (p. 387).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Diameter Distribution

(not for massless particles) allows you to change from the default **linear** interpolation method used to determine the size of the particles in a **group** injection, or the default **uniform** method used to determine the size of the particles in a **surface** injection, to the **rosin-rammler** or **rosin-rammler-logarithmic** method. The Rosin-Rammler method for determining the range of diameters is described in *Using the Rosin-Rammler Diameter Distribution Method* (p. 1035).

Evaporating Species

(for **droplet** particles) specifies the gas-phase species created by the vaporization and boiling laws (laws 2 and 3).

Devolatilizing Species

(for **combusting** particles) specifies the gas-phase species created by the devolatilization law (law 4).

This item will not appear for two-mixture-fraction non-premixed combustion calculations.

Devolatilizing Stream

(for **combusting** particles) specifies the destination stream for the gas-phase species created by the devolatilization law (law 4).

This item will appear only for two-mixture-fraction non-premixed combustion calculations.

Oxidizing Species

(for **combusting** particles) specifies the gas phase species that participates in the surface char combustion reaction (law 5).

Product Species

(for **combusting** particles) specifies the gas-phase species created by the surface char combustion reaction (law 5).

This item will not appear for two-mixture-fraction non-premixed combustion calculations.

Product Stream

(for **combusting** particles) specifies the destination stream for the gas-phase species created by the surface char combustion reaction (law 5).

This item will appear only for two-mixture-fraction non-premixed combustion calculations.

Discrete Phase Domain

is available when using the **Dense Discrete Phase Model**, described in *Including the Dense Discrete Phase Model* (p. 1167).

Point Properties

displays the inputs for the point properties for the injection (e.g., position, velocity, diameter, temperature, and mass flow rate). These inputs are described for each injection type in *Point Properties for Single Injections* (p. 1026) – *Point Properties for Effervescent Atomizer Injections* (p. 1034).

First Point

specifies the first point properties for the injection.

Last Point

specifies the last point properties for the injection.

Turbulent Dispersion

displays the inputs for stochastic tracking and cloud tracking.

Stochastic Tracking

controls the stochastic tracking for turbulent flows. Stochastic tracking includes the effect of turbulent velocity fluctuations on the particle trajectories using the DRW model described in Stochastic Tracking in the Theory Guide. See *Stochastic Tracking* (p. 1044) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Discrete Random Walk Model
includes the effect of instantaneous turbulent velocity formulations on the particle trajectories through stochastic method.

Random Eddy Lifetime
specifies that the characteristic lifetime of the eddy is to be random.

Number of Tries
controls the inclusion of turbulent velocity fluctuations.

An input of 1 or greater tells ANSYS FLUENT to include turbulent velocity fluctuations in the particle force balance.

Time Scale Constant
is C_L in Equation 16–16 in the Theory Guide. The default is 0.15; if you use the RSM, a value of 0.3 is recommended.

Cloud Tracking
incorporates the effects of turbulent dispersion on the injection. For details on the following items, see Particle Cloud Tracking in the Theory Guide and *Cloud Tracking* (p. 1045).

Cloud Model
enables particle cloud tracking.

Min. Cloud Diameter
specifies the diameter of the cloud in which the particles enter the domain.

Max. Cloud Diameter
specifies the maximum allowed cloud diameter.

Wet Combustion
displays the inputs for the wet combustion model.

Wet Combustion Model
allows the combusting particles to include an evaporating/boiling material.

Liquid Material
contains a drop-down list of liquid materials that can be chosen as the evaporating/boiling material to be included with the combusting particles.

Liquid Fraction
sets the volume fraction of the liquid present in the particle.

Components
displays the inputs for **Multicomponent** for use in the definition of the particle injection. For details on the following items, see Vapor Liquid Equilibrium Theory in the Theory Guide.

Multicomponent Settings
contains the multicomponent injections.

Component
specifies the component which is a part of the multicomponent species.

Mass Fraction
specifies the mass fraction of the component in a multicomponent species.

Evaporating Species
specifies the gas-phase species to be evaporated.

Evaporating Stream
specifies the source stream from which the species will be evaporated.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

UDF

displays the inputs for **User-Defined Functions** for use in the definition of the particle injection. For details about user-defined functions, see the separate UDF Manual.

Initialization

contains a drop-down list of available user-defined functions. The UDF that you choose will be used to modify the injection properties at the time the particles are injected into the domain.

Heat/Mass Transfer

allows you to select the UDF that defines the heat or mass transfer.

Multiple Reactions

displays the inputs for **Multiple Surface Reactions**. See *Particle Surface Reactions* (p. 835) for details about this model.

Species Mass Fractions

specify the combustible fraction of the combusting particle if you have defined more than one particle surface species. See *Using the Multiple Surface Reactions Model for Discrete-Phase Particle Combustion* (p. 836) for details.

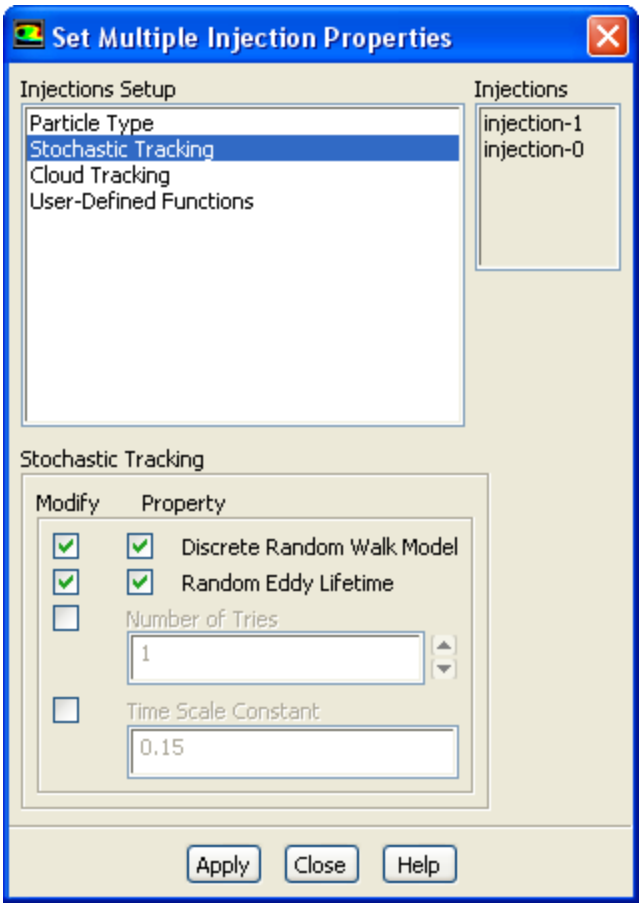
File...

opens the *The **Select File** Dialog Box* (p. 33), in which you can select a file containing the injection definition (when **file** is selected as the **Injection Type**).

36.3.13.3. Set Multiple Injection Properties Dialog Box

The **Set Multiple Injection Properties** dialog box allows you to set properties that are common to multiple injections. This dialog box is opened when you select more than one injections in the *Injections Dialog Box* (p. 2096). See *Defining Properties Common to More than One Injection* (p. 1047) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Injections Setup

contains a list of the categories of injection properties that you can set for the injections in the **Injections** list. These categories correspond to the categories of inputs in the *Set Injection Properties Dialog Box* (p. 2097). When you select an item in the **Injections Setup** list, the dialog box will expand to show the relevant inputs, which are the same as those in the **Set Injection Properties** dialog box.

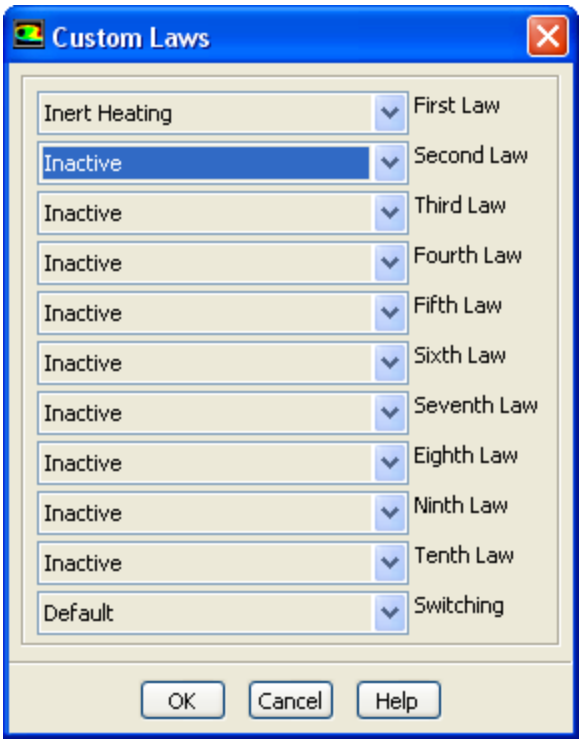
Injections

displays an informational list of the injections for which you are setting common properties. These are the injections that you selected in the *Injections Dialog Box* (p. 2096).

36.3.13.4. Custom Laws Dialog Box

The **Custom Laws** dialog box is used to incorporate user-defined functions (see the separate UDF Manual for details) in place of the default physical laws (1 through 6) used in the heat/mass transfer calculations.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

First Law, Second Law, Third Law, Fourth Law, Fifth Law, Sixth Law
contain drop-down lists in which you can choose a user-defined particle law to replace the standard law.

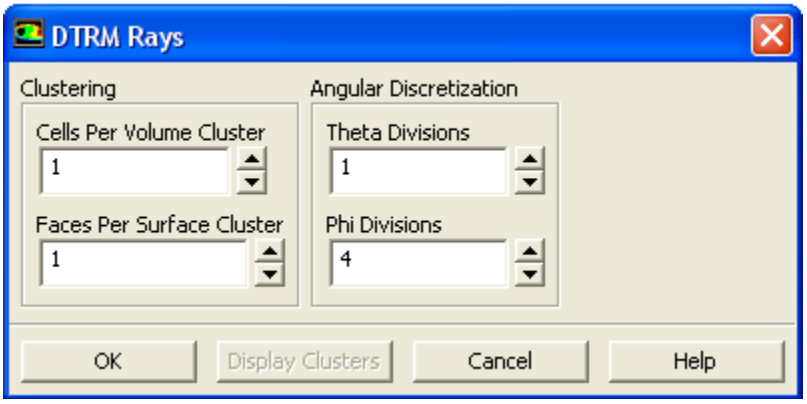
Switching
contains a drop-down list in which you can select a user-defined function that customizes the way ANSYS FLUENT switches between particle laws.

36.3.14. Define/DTRM Rays...

The **Define/DTRM Rays...** menu item opens the *DTRM Rays Dialog Box* (p. 2103).

36.3.14.1. DTRM Rays Dialog Box

The **DTRM Rays** dialog box allows you to define the rays used by the discrete transfer radiation model (DTRM). It opens automatically when you click on **OK** after selecting the **Discrete Transfer** model in the *Radiation Model Dialog Box* (p. 1657). See *Setting Up the DTRM* (p. 707) for details about the items below.



Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Clustering
contains parameters for the clusters (see Clustering in the Theory Guide).

Cells Per Volume Cluster, Faces Per Surface Cluster
control the number of radiating surfaces and absorbing cells. (See the explanation in *Controlling the Clusters* (p. 708).)

Angular Discretization
contains parameters for the ray traces (see Ray Tracing in the Theory Guide).

Theta Divisions, Phi Divisions
control the number of rays being traced. (Guidelines are provided in *Controlling the Rays* (p. 708).)

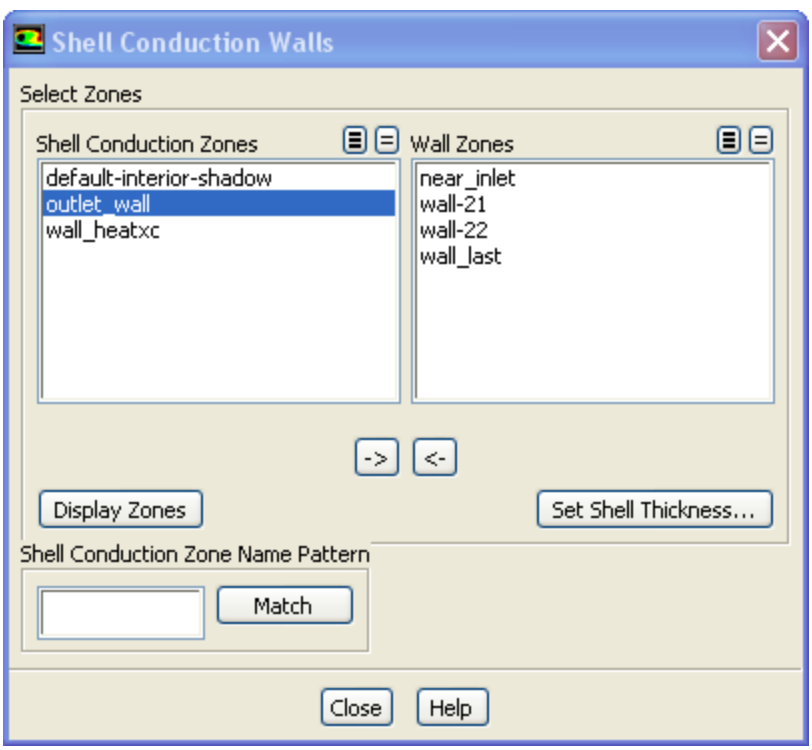
Display Clusters
generates a graphical display of the clusters in the domain. (This item is available only after you have created or read a ray file.)

36.3.15. Define/Shell Conduction Walls...

The **Define/Shell Conduction Walls...** menu item opens the *Shell Conduction Walls Dialog Box* (p. 2104).

36.3.15.1. Shell Conduction Walls Dialog Box

The **Shell Conduction Walls** dialog box allows you to manage, define, and display shell conduction zones all in one location. See *Managing Shell Conduction Walls* (p. 703) for details about using the **Shell Conduction Walls** dialog box.



Controls

Select Zones
contains the list of **Shell Conduction Zones** and **Wall Zones**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

In essence, the −−> button disables shell conduction and the <−− button enables shell conduction.

Shell Conduction Zones
contains a list of zones with shell conduction enabled.

Wall Zones
contains a list of zones without shell conduction.

−−>, <−−
disables and enables shell conduction, respectively.

Display Zones
displays the selected wall(s) in the graphics window. Note that you can select walls with or without shell conduction. The zones will be displayed with different colors depending on the option selected in *Mesh Colors Dialog Box* (p. 1638) (accessible from the *Mesh Display Dialog Box* (p. 1635)).

Set Shell Thickness...
opens the *Set Shell Thickness Dialog Box* (p. 2105)

Shell Conduction Zone Name Pattern
specifies the pattern to look for in the names of shell conduction zones. Type the pattern in the text field and click **Match** to select (or deselect) the zones in the **Shell Conduction Zones** list with names that match the specified pattern.

36.3.15.2. Set Shell Thickness Dialog Box

The **Set Shell Thickness** dialog box allows you to set the thicknesses of the selected **Shell Conduction Zones** in the *Shell Conduction Walls Dialog Box* (p. 2104). See *Managing Shell Conduction Walls* (p. 703) for details about the items below.

Controls

Thickness
allows you to apply the same thickness to all the selected shell conduction zones. Click the **Apply** button to accept the specified thickness.

Shell Conduction Zones
allows you to apply different thicknesses to the selected shell conduction zones; enter the values against each zone listed in the **Shell Conduction Zones** group box.

36.3.16. Define/Custom Field Functions...

The **Define/Custom Field Functions...** menu item opens the *Custom Field Function Calculator Dialog Box* (p. 2106).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

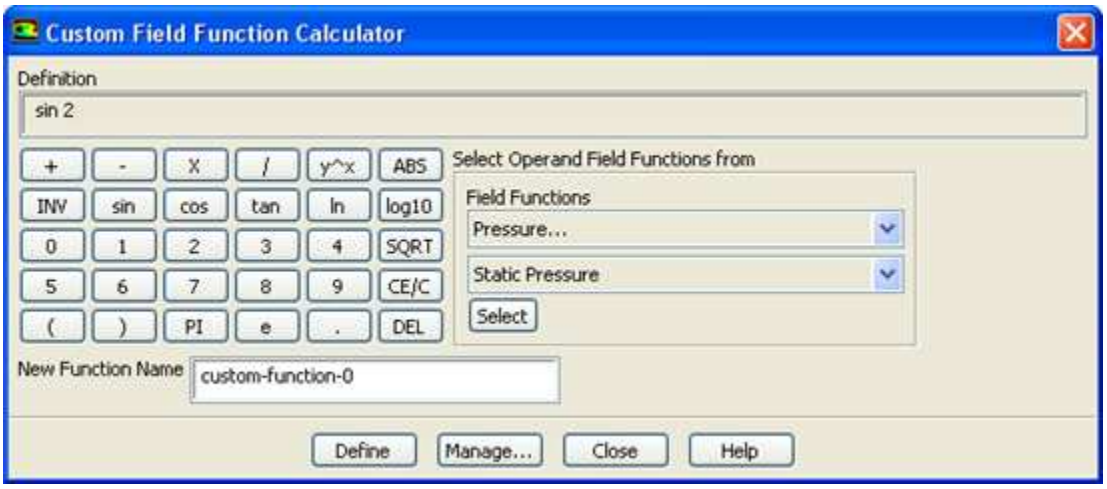
36.3.16.1. Custom Field Function Calculator Dialog Box

The **Custom Field Function Calculator** dialog box allows you to define custom field functions based on existing functions, using simple calculator operators. Any functions that you define will be added to the list of default flow variables and other field functions provided by ANSYS FLUENT.

Important

Recall that you must enter all constants in the function definition in SI units.

See *Creating a Custom Field Function* (p. 1580) for details about the items below.



Controls

Definition
displays the function that you are currently defining. As you select each item from the **Field Functions** list or the calculator keypad, it will appear in the **Definition** text entry box. You *cannot* edit the contents of this box directly; if you want to delete part of a function, use the **Delete** button on the keypad.

(Calculator Buttons)
are push buttons that perform calculator operations. When you select a calculator button (by clicking on it), the appropriate symbol will appear in the **Definition** text entry box.

Select Operand Field Functions from
contains the available field functions and the means for selecting them.

Field Functions
contains a list from which you can select a variable to be used in the definition of a new function.

Select
enters the variable that is currently selected in the **Field Functions** list in the **Definition** field.

New Function Name
specifies the name of the function you are defining. Should you decide to change the function name after you have defined the function, you can do so in the *Field Function Definitions Dialog Box* (p. 2107), which you can open by clicking on the **Manage...** push button.

Define
creates the function and adds it to the list of **Custom Field Functions** within the drop-down list of available field functions. The **Define** push button is grayed out after you create a new function or if the **Definition** field is empty.

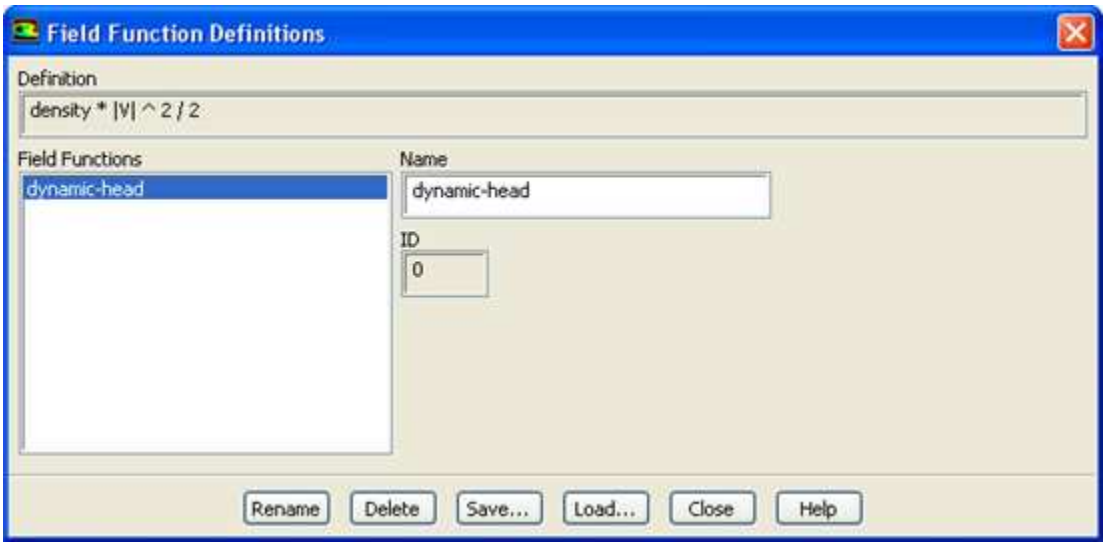
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Manage...

opens the *Field Function Definitions Dialog Box* (p. 2107), which enables you to check, rename, save, load, and delete custom field functions.

36.3.16.2. Field Function Definitions Dialog Box

The **Field Function Definitions** dialog box allows you to check, rename, save, load, and delete custom field functions that you defined in the *Custom Field Function Calculator Dialog Box* (p. 2106). See *Manipulating, Saving, and Loading Custom Field Functions* (p. 1582) for details about the items below.



Controls

Definition

displays the function selected in the **Field Functions** list. This display is for informational purposes only; you cannot edit it.

Field Functions

contains a selectable list of custom field functions. When you select a function, its definition will appear in the **Definition** box and its name will appear in the **Name** text entry box.

Name

displays the name of the currently selected field function. You can enter a new name in this box if you want to rename the function.

ID

reports the ID number of the selected function. The field function at the top of the list has an ID of 0, the second function has an ID of 1, and so on.

Rename

changes the name of the selected function to the name specified in the **Name** text entry box.

Delete

deletes the selected field function.

Save...

opens the *The **Select File** Dialog Box* (p. 33), where you can specify a file in which to save all of the functions in the **Field Functions** list.

Load...

opens the **Select File** dialog box, where you can specify a file from which to read custom field functions (i.e., a file that you saved using the **Save...** button above).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.3.17. Define/Parameters...

The **Define/Parameters...** menu item opens the *Parameters Dialog Box* (p. 2041).

36.3.18. Define/Profiles...

The **Define/Profiles...** menu item opens the *Profiles Dialog Box* (p. 1808).

36.3.19. Define/Units...

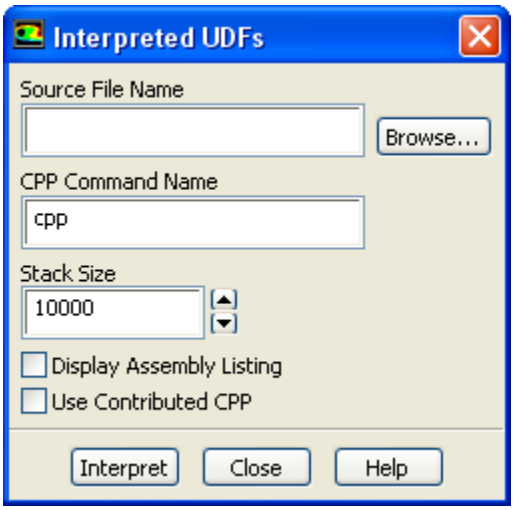
The **Define/Units...** menu item opens the *Set Units Dialog Box* (p. 1637).

36.3.20. Define/User-Defined/Functions/Interpreted...

The **Define/User-Defined/Functions/Interpreted...** menu item opens the *Interpreted UDFs Dialog Box* (p. 2108).

36.3.20.1. Interpreted UDFs Dialog Box

The **Interpreted UDFs** dialog box allows you to compile user-defined functions. See the separate UDF Manual for details.



Controls

Source File Name
sets the name of your user-defined function.

CPP Command Name
sets the name of your C preprocessor.

Stack Size
sets the size of the stack. Keep the default **Stack Size** setting of 10000, unless the number of local variables in your function will cause the stack to overflow. In this case, set the **Stack Size** to a number that is greater than the number of local variables used.

Display Assembly Listing
indicates whether or not to display a listing of assembly language code in your console window as the function compiles.

Use Contributed CPP
specifies the use of the C preprocessor that Fluent Inc. has supplied, instead of your own.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

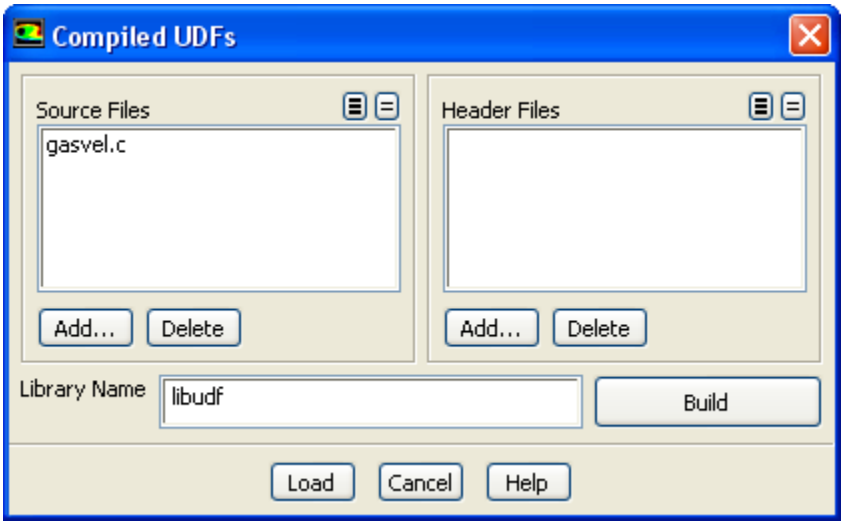
Interpret
interprets the specified function.

36.3.21. Define/User-Defined/Functions/Compiled...

The **Define/User-Defined/Functions/Compiled...** menu item opens the *Compiled UDFs Dialog Box* (p. 2109).

36.3.21.1. Compiled UDFs Dialog Box

The **Compiled UDFs** dialog box allows you to open a library of compiled user-defined functions. See the separate UDF Manual for details.



Controls

Source Files
contains a list of source files.

Header Files
contains a list of header files.

Add...
opens the **Select File** dialog box.

Delete
deletes the selected file from the list.

Library Name
specifies the name of the library to be created.

Build
builds the library and compiles the UDF.

Load
opens the specified library and loads the UDF.

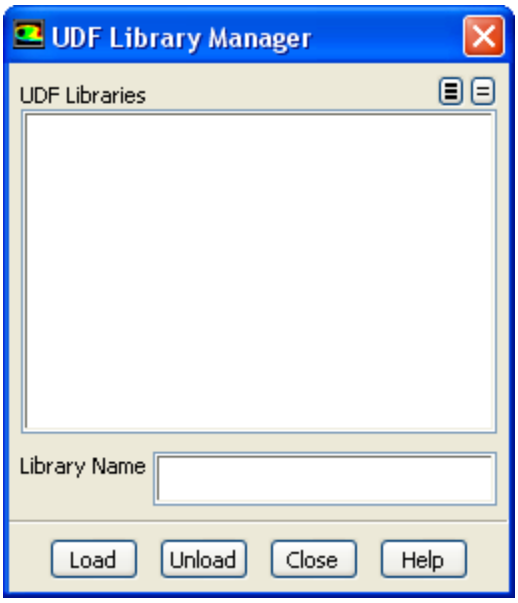
36.3.22. Define/User-Defined/Functions/Manage...

The **Define/User-Defined/Functions/Manage...** menu item opens the *UDF Library Manager Dialog Box* (p. 2110).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.3.22.1. UDF Library Manager Dialog Box

The **UDF Library Manager** dialog box allows you to load/unload the UDF libraries. See the separate UDF Manual for details.



Controls

UDF Libraries
lists the UDF libraries that are loaded in ANSYS FLUENT.

Library Name
specifies the name of the library to be loaded/unloaded.

Load
opens the specified library and loads the UDF.

Unload
unloads the specified library.

36.3.23. Define/User-Defined/Function Hooks...

The **Define/User-Defined/Function Hooks...** menu item opens the *User-Defined Function Hooks Dialog Box* (p. 2110).

36.3.23.1. User-Defined Function Hooks Dialog Box

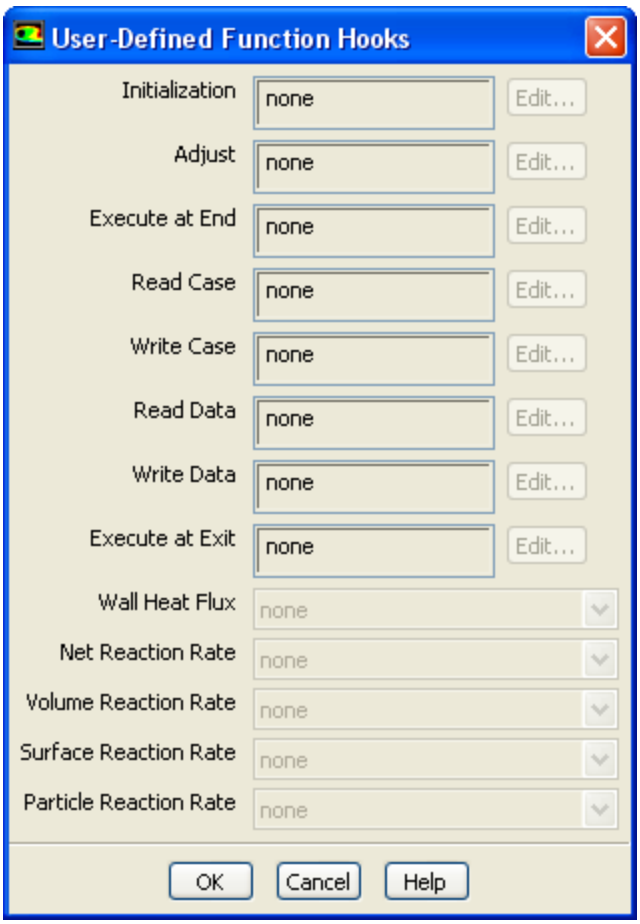
The **User-Defined Function Hooks** dialog box allows you to specify user-defined functions (UDFs) connected to a number of models and procedures in ANSYS FLUENT. See the separate UDF Manual for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Important

You can hook multiple UDFs to the following functions:

- **Controls**
- **Initialization**
- **Adjust**
- **Execute At End**
- **Read Case**
- **Write Case**
- **Read Data**
- **Write Data**
- **Execute at Exit**



Controls

Initialization

selects a UDF that is called immediately after you initialize your flow field.

Adjust

selects a UDF that is called at the beginning of an iteration before solution of velocities, pressure, and other quantities begins.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Execute At End
selects a UDF that is called at the end of an iteration or time step.

Read Case
selects a UDF that defines a customized section that is to be read from the case file.

Write Case
selects a UDF that defines a customized section that is to be written to the case file.

Read Data
selects a UDF that defines a customized section that is to be read from the data file.

Write Data
selects a UDF that defines a customized section that is to be written to the data file.

Execute at Exit
selects a UDF that is called when exiting an ANSYS FLUENT session.

Wall Heat Flux
selects a UDF that modifies the way that the solver computes the heat flux between a wall and the neighboring fluid cells.

Net Reaction Rate
selects a UDF that defines the net reaction rate.

Volume Reaction Rate
selects a UDF that defines a volumetric reaction rate.

Surface Reaction Rate
selects a UDF that defines a surface reaction rate.

Particle Reaction Rate
selects a UDF that defines a particle reaction rate.

Turbulent Premixed Source
selects a UDF that defines the turbulent flame speed and source term for the premixed or partially premixed combustion model.

Chemistry Step
selects a UDF that defines the chemistry step function.

Spray Collide
selects a UDF that defines the spray collide function.

Cavitation Mass Rate
selects a UDF that defines the cavitation rate.

DO Source
selects a UDF that defines the discrete ordinate source function.

DO Diffuse Reflectivity
selects a UDF that defines the diffuse reflectivity function for the DO radiation model.

DO Specular Reflectivity
selects a UDF that defines the specular reflectivity function for the DO radiation model.

Emissivity Weighting Factor

selects a UDF that defines the emissivity weighting factor for the non-gray DO radiation model or the non-gray P-1 radiation model.

Thickened Flame Model Parameters

selects a UDF that defines the parameters for the Thickened Flame Model.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.3.24. Define/User-Defined/Execute on Demand...

The **Define/User-Defined/Execute on Demand...** menu item opens the *Execute on Demand Dialog Box* (p. 2113).

36.3.24.1. Execute on Demand Dialog Box

The **Execute on Demand** dialog box allows you to execute a specified user-defined function immediately. See the separate UDF Manual for details.

Controls

Execute on Demand
selects the UDF to be executed.

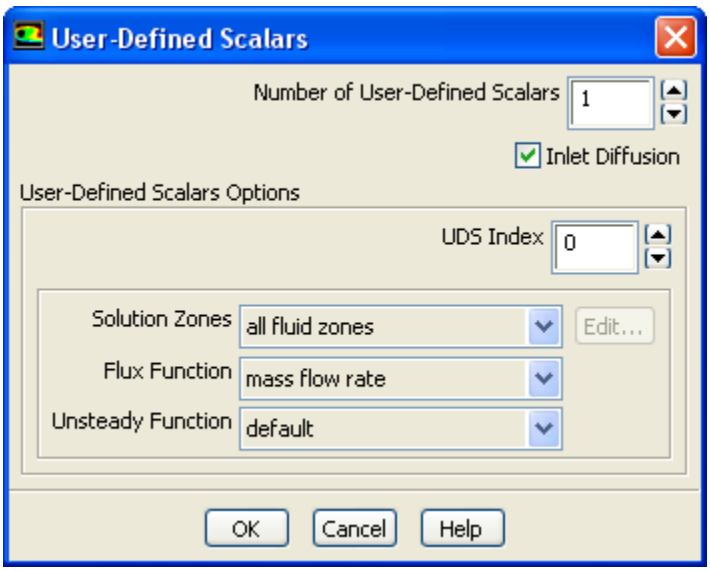
Execute
executes the selected function.

36.3.25. Define/User-Defined/Scalars...

The **Define/User-Defined/Scalars...** menu item opens the *User-Defined Scalars Dialog Box* (p. 2113).

36.3.25.1. User-Defined Scalars Dialog Box

The **User-Defined Scalars** dialog box allows you to include user-defined scalar transport equations in your calculation. See *User-Defined Scalar (UDS) Transport Equations* (p. 485) for details.



Controls

Number of User-Defined Scalars
specifies how many additional scalar transport equations you would like to include in the calculation.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Inlet Diffusion
when enabled allows you to include the diffusion term in the UDS transport equation for all inflow and outflow boundaries.

User-Defined Scalars Options
contains settings that define the scalar transport equation.

UDS Index
when set to 0 marks the first user-defined scalar equation.

Solution Zones
specifies in which zone the scalar equation will be solved: **all fluid zones**, **all solid zones**, **all zones** (fluid and solid) or **selected zones**.

Flux Function
is a drop-down list containing available functions for the convection term of the user-defined scalar transport equation(s).

none
(the default) indicates that there is no convection term included in the scalar transport equation(s); i.e., you want to solve a Poisson equation instead of a convection/diffusion equation.

mass flow rate
indicates that the convection term in the scalar transport equation(s) is equal to the mass flow rate $\rho \vec{v} \cdot \vec{A}$.

Note that the **none** and **mass flow rate** options will apply to all solved user-defined scalars. A user-defined flux function must be supplied if a different convective flux is desired for each user-defined scalar.

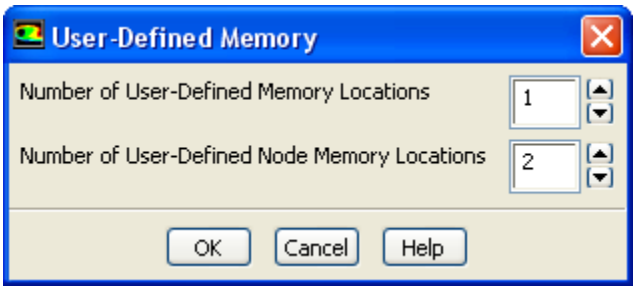
Unsteady Function
is a drop-down list containing available functions for the unsteady term of the user-defined scalar transport equation(s).

36.3.26. Define/User-Defined/Memory...

The **Define/User-Defined/Memory...** menu item opens the *User-Defined Memory Dialog Box* (p. 2114).

36.3.26.1. User-Defined Memory Dialog Box

The **User-Defined Memory** dialog box allows you to allocate memory for user-defined storage variables. See the separate UDF Manual for details.



Controls

Number of User-Defined Memory Locations
specifies the number of memory locations to be allocated.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of User-Defined Node Memory Locations
specifies the number of node memory locations to be allocated.

Important

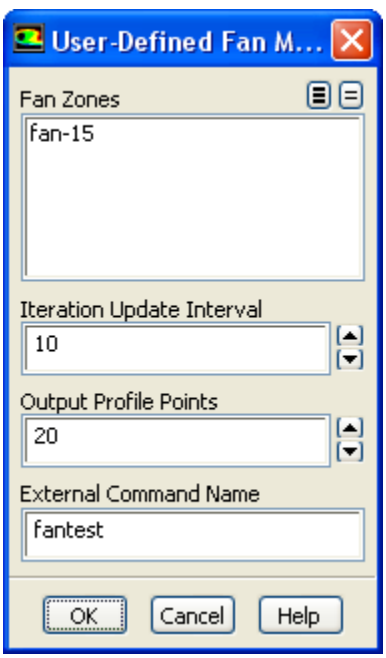
For postprocessing **User-Defined Memory** in CFD-Post, the ANSYS FLUENT user must select the UDM quantities using the **Data File Quantities** option and subsequently write the data file to postprocess the quantities in ANSYS FLUENT. Alternatively, you have the option of exporting the desired quantities to a.cdat file. This will ensure that all the UDM quantities are available for postprocessing in CFD-Post. Please refer to the ANSYS CFD-Post manual for more information.

36.3.27. Define/User-Defined/Fan Model...

The **Define/User-Defined/Fan Model...** menu item opens the *User-Defined Fan Model Dialog Box* (p. 2115).

36.3.27.1. User-Defined Fan Model Dialog Box

The **User-Defined Fan Model** dialog box allows you to periodically regenerate a profile file which can be used to specify the characteristics of a fan, including pressure jump across the fan, and radial and swirling components of velocity generated by the fan. See *User-Defined Fan Model* (p. 359) for details about this feature and how to use this dialog box.



Controls

Fan Zones
contains a list from which you can select the fan zone(s) on which your executable will operate.

Iteration Update Interval
specifies how often the executable will be called on to update the fan profile file.

Output Profile Points
specifies the number of points in the profile file to be written by ANSYS FLUENT.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

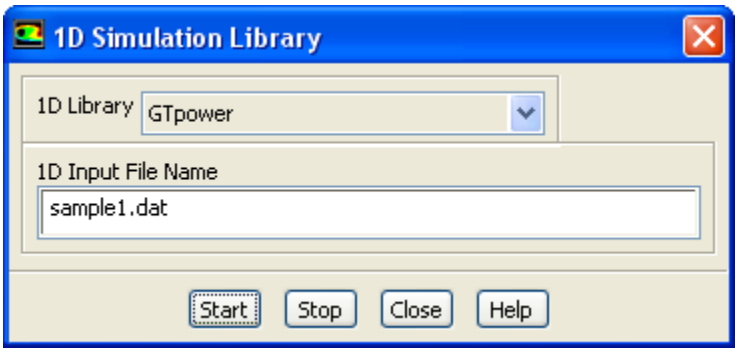
External Command Name
specifies the name of the executable.

36.3.28. Define/User-Defined/1D Coupling...

The **Define/User-Defined/1D Coupling...** menu item opens the *1D Simulation Library Dialog Box* (p. 2116).

36.3.28.1. 1D Simulation Library Dialog Box

The **1D Simulation Library** dialog box allows you to set parameters related to coupling between ANSYS FLUENT and GT-Power or WAVE. See *Coupling Boundary Conditions with GT-Power* (p. 379) or *Coupling Boundary Conditions with WAVE* (p. 381) for details about the items below.



Controls

1D Library
specifies the type of library to be used. (Currently only **GTpower** and **WAVE** are available.)

1D Input File Name
specifies the name of the GT-Power or WAVE input file.

Start
starts up GT-Power or WAVE and generates ANSYS FLUENT user-defined functions for each boundary in the input file.

Stop
unlinks the shared library.

36.4. Solve Menu

For additional information, please see the following sections:

36.4.1. Solve/Methods...
36.4.2. Solve/Controls...
36.4.3. Solve/Monitors...
36.4.4. Solve/Initialization...
36.4.5. Solve/Calculation Activities...
36.4.6. Solve/Run Calculation....

36.4.1. Solve/Methods...

The **Solve/Methods...** menu item opens the *Solution Methods Task Page* (p. 1900).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.4.2. Solve/Controls...

The **Solve/Controls...** menu item opens the *Solution Controls Task Page* (p. 1902).

36.4.3. Solve/Monitors...

The **Solve/Monitors...** menu item opens the *Monitors Task Page* (p. 1913).

36.4.4. Solve/Initialization...

The **Solve/Initialization...** menu item opens the *Solution Initialization Task Page* (p. 1937).

36.4.5. Solve/Calculation Activities...

The **Solve/Calculation Activities...** menu item opens the *Calculation Activities Task Page* (p. 1942).

36.4.6. Solve/Run Calculation....

The **Solve/Run Calculation...** menu item opens the *Run Calculation Task Page* (p. 1955).

36.5. Adapt Menu

For additional information, please see the following sections:

36.5.1. Adapt/Boundary...
36.5.2. Adapt/Gradient...
36.5.3. Adapt/Iso-Value...
36.5.4. Adapt/Region...
36.5.5. Adapt/Volume...
36.5.6. Adapt/Yplus/Ystar...
36.5.7. Adapt/Anisotropic...
36.5.8. Adapt/Manage...
36.5.9. Adapt/Controls...
36.5.10. Adapt/Geometry...
36.5.11. Adapt/Display Options...
36.5.12. Adapt/Smooth/Swap...

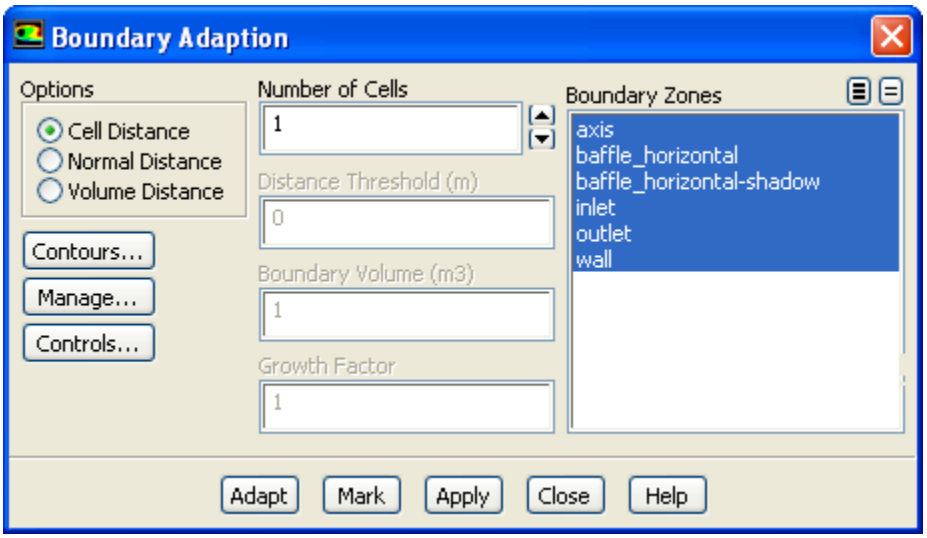
36.5.1. Adapt/Boundary...

The **Adapt/Boundary...** menu item opens the *Boundary Adaption Dialog Box* (p. 2117)

36.5.1.1. Boundary Adaption Dialog Box

The **Boundary Adaption** dialog box allows you to mark or refine boundary cells on selected boundary zones. See *Boundary Adaption* (p. 1328) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains three different methods for boundary adaption:

Cell Distance

enables adaption based on a cell's distance from the boundary, measured in number of cells. See *Boundary Adaption Based on Number of Cells* (p. 1329) for details.

Normal Distance

enables adaption based on a cell's normal distance from the boundary. See *Boundary Adaption Based on Normal Distance* (p. 1330) for details.

Volume Distance

enables adaption based on a target boundary volume and growth factor. See *Boundary Adaption Based on Target Boundary Volume* (p. 1330) for details.

Contours...

opens the *Contours Dialog Box* (p. 1967), which you can use to determine the appropriate parameters for the boundary adaption.

Manage...

opens the *Manage Adaption Registers Dialog Box* (p. 2129), which allows you to display and manipulate adaption registers that are generated using the **Mark** command.

Controls...

opens the *Mesh Adaption Controls Dialog Box* (p. 2130), which allows you to control certain aspects of the adaption process.

Number of Cells

sets the maximum boundary cell distance for adaption (used with the **Cell Distance** option.

Distance Threshold

sets the maximum normal distance for adaption (used with the **Normal Distance** option).

Boundary Volume

sets the boundary volume $V_{boundary}$ in *Equation 29–1* (p. 1331) (used with the **Volume Distance** option).

Growth Factor

sets the exponential growth factor α in *Equation 29–1* (p. 1331) (used with the **Volume Distance** option).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Boundary Zones

contains a selectable list of zones on which you can refine. The boundary cells associated with the zones that you select will be refined.

Adapt

refines the cells with edges/faces on the zones selected in the **Boundary Zones** list.

Mark

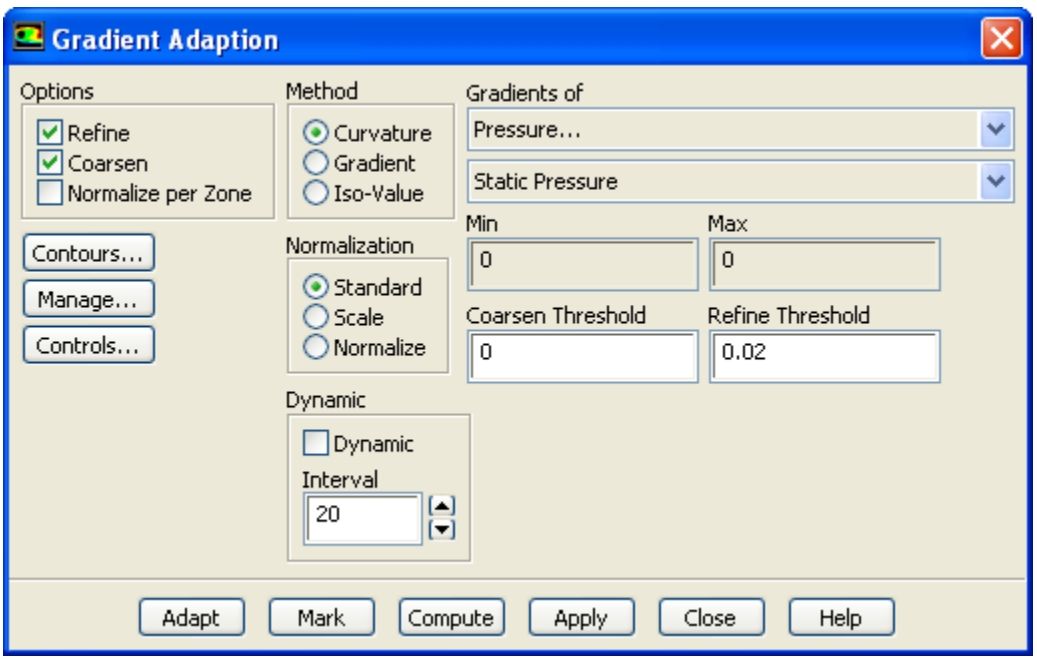
marks the boundary cells associated with the zones selected in the **Boundary Zones** list for refinement. This command produces an adaption register. For information on using adaption registers, see *Manipulating Adaption Registers* (p. 1343).

36.5.2. Adapt/Gradient...

The **Adapt/Gradient...** menu item opens the *Gradient Adaption Dialog Box* (p. 2119).

36.5.2.1. Gradient Adaption Dialog Box

The **Gradient Adaption** dialog box allows you to mark or adapt to gradients of a specified field variable. See *Gradient Adaption* (p. 1331) for details.



Controls

Options

contains the check buttons that toggle the ability to mark and/or adapt cells for refinement or coarsening.

Refine

toggles the ability to refine or mark cells for refinement.

Coarsen

toggles the ability to coarsen or mark cells for coarsening (available in 2D and axisymmetric cases).

Normalize per Zone

toggles the ability of zonal normalization.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Contours...
opens the *Contours Dialog Box* (p. 1967), which you can use as an aid to selecting adaption thresholds by displaying contours of adaption function.

Manage...
opens the *Manage Adaption Registers Dialog Box* (p. 2129), which allows you to display and manipulate adaption registers that are generated using the **Mark** command.

Controls...
opens the *Mesh Adaption Controls Dialog Box* (p. 2130), which allows you to control certain aspects of the adaption process.

Method
contains options for specifying the criterion for adaption.

Curvature
specifies the use of the second gradient of a field variable for adaption. This approach is recommended for problems with smooth solutions.

Gradient
specifies the use of the first gradient of a field variable for adaption. This approach is recommended for problems with strong shocks.

Iso-Value
allows you to customize the adaption criterion (using custom field functions, user-defined scalars, etc.).

Normalization
contains the options available for normalization.

Standard
specifies that the gradient or curvature is not normalized.

Scale
specifies that the gradient or curvature is scaled by its average value in the domain.

Normalize
specifies that the gradient or curvature is scaled by its maximum value in the domain (i.e. the gradient or curvature is bounded by [0, 1]).

Dynamic
contains options to specify dynamic gradient adaption.

Dynamic
enables dynamic gradient adaption.

Interval
allows you to specify the number of iterations or time-steps between two consecutive automatic mesh adaptions, depending on whether you are performing a steady-state or a time-dependent solution, and on which solver you are using.

Gradients of
contains a list of the field variables that can be used in the gradient adaption function.

Min/Max
displays the minimum and maximum cell values of the gradient adaption function based on the selected quantity.

Coarsen Threshold
designates the threshold values for coarsening the mesh. Cells with adaption function values below the **Coarsen Threshold** will be marked for coarsening.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Refine Threshold
designates the threshold values for refining the mesh. Cells with adaption function values above the **Refine Threshold** will be marked for refinement.

Adapt
adapts the mesh based on the gradients of the selected scalar quantity, the coarsening and refining toggle buttons and thresholds, and the adaption limits.

Mark
marks cells to be refined and/or coarsened based on the gradients of the selected quantity and the coarsening and refining toggle buttons and thresholds. This command produces an adaption register. For information on using adaption registers, see *Manipulating Adaption Registers* (p. 1343).

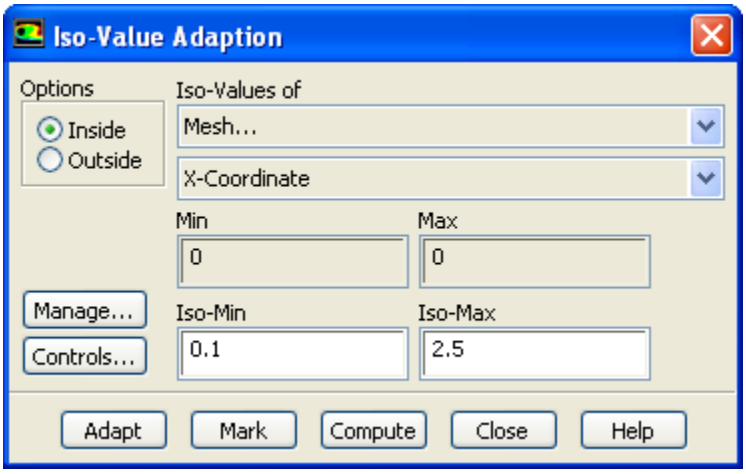
Compute
computes the minimum and maximum cell values of the gradient adaption function with the selected scalar quantity. The values are displayed in the **Min** and **Max** real number fields.

36.5.3. Adapt/Iso-Value...

The **Adapt/Iso-Value...** menu item opens the *Iso-Value Adaption Dialog Box* (p. 2121).

36.5.3.1. Iso-Value Adaption Dialog Box

The **Iso-Value Adaption** dialog box allows you to mark or refine cells inside or outside a specified range of a selected scalar function. See *Isovalue Adaption* (p. 1335) for details.



Controls

Options
contains radio buttons that control whether the cells inside or outside the isovalue range are marked for refinement.

Inside
enables the marking of cells with values between **Iso-Min** and **Iso-Max**.

Outside
enables the marking of cells with values less than **Iso-Min** or greater than **Iso-Max**.

Iso-Values of
contains a list from which you can select the solution variable to be used in the isovalue adaption function.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Min/Max
displays the minimum and maximum cell values of the selected field variable. The real number field values are not editable; they are purely informational.

Iso-Min
defines the minimum isovalue threshold.

Iso-Max
defines the maximum isovalue threshold.

Manage...
opens the *Manage Adaption Registers Dialog Box* (p. 2129), which allows you to display and manipulate adaption registers that are generated using the **Mark** command.

Controls...
opens the *Mesh Adaption Controls Dialog Box* (p. 2130), which allows you to control certain aspects of the adaption process.

Adapt
adapts the mesh based on the isovalues of the selected solution variable, the isovalue ranges, and the **Inside/Outside** option.

Mark
marks cells to be refined based on the isovalues of the selected quantity, the isovalue ranges, and the **Inside/Outside** option. This command produces an adaption register. For information on using adaption registers, see *Manipulating Adaption Registers* (p. 1343).

Compute
computes the minimum and maximum cell values of the selected solution variable and displays them in the **Min** and **Max** real number fields.

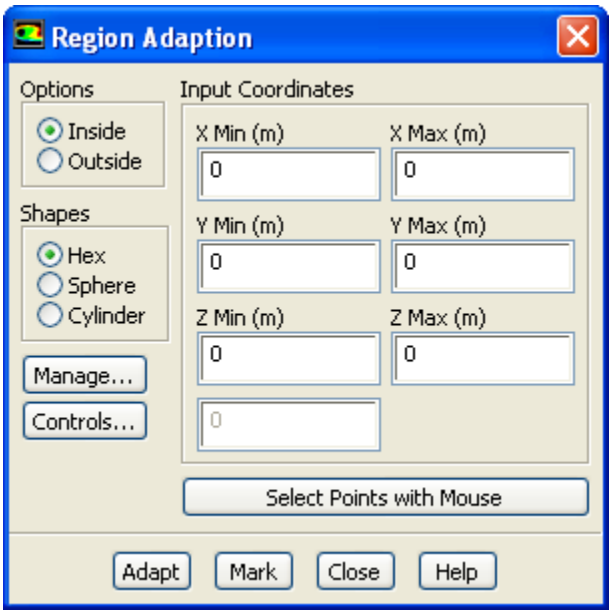
36.5.4. Adapt/Region...

The **Adapt/Region...** menu item opens the *Region Adaption Dialog Box* (p. 2122).

36.5.4.1. Region Adaption Dialog Box

The **Region Adaption** dialog box allows you to mark or refine cells inside or outside a specified region defined by text or mouse input. See *Region Adaption* (p. 1336) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains radio buttons that control whether the cells inside or outside the region are marked for refinement.

Inside

enables the marking of cells with centroids that are within the region.

Outside

enables the marking of cells with centroids that are outside the region.

Shapes

contains radio buttons that control the type of region.

Hex/Quad

defines a hexahedral region in 3D or a rectangular region in 2D. The appropriate button will appear for the solver you are using.

Sphere/Circle

defines a spherical region in 3D or a circular region in 2D. The appropriate button will appear for the solver you are using.

Cylinder

defines a cylindrical region in 3D or a rectangular region in 2D.

Manage...

opens the *Manage Adaption Registers Dialog Box* (p. 2129), which allows you to display and manipulate adaption registers that are generated using the **Mark** command.

Controls...

opens the *Mesh Adaption Controls Dialog Box* (p. 2130), which allows you to control certain aspects of the adaption process.

Input Coordinates

defines the extent of the selected region. The appearance of this box changes depending on the type of region selected.

If the region selected is a hexahedron or quadrilateral, you will input the minimum and maximum coordinates defining the box. (The **Radius** real number field will not be active.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

X Min, Y Min, Z Min
define the coordinates of the minimum point defining the hexahedron or rectangle. For quadrilaterals, the **Z Min** real entry field will not be active.

X Max, Y Max, Z Max
define the coordinates of the maximum point defining the hexahedron or rectangle. For quadrilaterals, the **Z Max** real entry field will not be active.

If the region selected is a sphere or circle, you will input the coordinates of the sphere's center and its radius. (The maximum coordinate real number fields will not be active.)

X Center, Y Center, Z Center
are the coordinates of the centroid of the sphere or circle. For circles, the **Z Center** real entry field will not be active.

Radius
is the radius of the sphere or circle.

If the region selected is a cylinder, you will input the minimum and maximum coordinates defining the cylinder axis, as well as the radius of the cylinder.

X-Axis Min, Y-Axis Min, Z-Axis Min
define the coordinates of the minimum point defining the cylinder axis. For 2D cases, the **Z-Axis Min** real entry field will not be active.

X-Axis Max, Y-Axis Max, Z-Axis Max
define the coordinates of the maximum point defining the cylinder axis. For 2D cases, the **Z-Axis Max** real entry field will not be active.

Radius
is the radius of the cylinder. (In 2D, this will be the width of the resulting rectangle.)

Select Points with Mouse
activates selection of input coordinates with the mouse. If one of the mouse buttons is defined as a mouse probe, you may select the input coordinates from a display of the mesh or solution field. For more information on mouse buttons, please refer to *Controlling the Mouse Button Functions* (p. 1427). After you select the points, the values will be loaded automatically into the appropriate real number field. If you desire, you can edit these values before marking or adapting. The order of input for defining a hexahedron (rectangle) is insignificant, but the order of input for the sphere (circle) has significance. First, you select the location of the centroid. Then you select a point that lies on the sphere, i.e., a point that is one radius away from the centroid.

Adapt
adapts the mesh based on the region defined and the in/out option.

Mark
marks the cells to be refined based on the region defined and the in/out option. This command produces an adaption register. For information on using adaption registers, see *Manipulating Adaption Registers* (p. 1343).

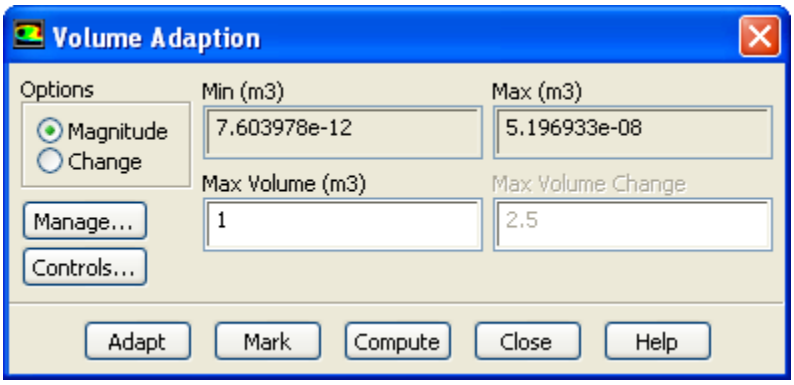
36.5.5. Adapt/Volume...

The **Adapt/Volume...** menu item opens the *Volume Adaption Dialog Box* (p. 2124).

36.5.5.1. Volume Adaption Dialog Box

The **Volume Adaption** dialog box allows you to mark or refine cells based on cell volume or change in cell volume. See *Volume Adaption* (p. 1337) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains the radio buttons that toggle between marking and/or refining based on volume magnitude or volume change.

Magnitude

enables the marking/refining of cells based on volume magnitude.

Change

enables the marking/refining of cells based on the change in volume.

Min

displays the minimum value of cell volume or cell volume change in the mesh. This value is not editable.

Max

displays the maximum value of cell volume or cell volume change in the mesh. This value is not editable.

Max Volume

defines the threshold value for marking/refining the mesh based on volume magnitude. Cells that have volumes greater than the threshold are marked for refinement.

Max Volume Change

defines the threshold value for marking/refining the mesh based on the change in volume. Cells with volume changes that are greater than the threshold value are marked for refinement.

Manage...

opens the *Manage Adaption Registers Dialog Box* (p. 2129), which allows you to display and manipulate adaption registers that are generated using the **Mark** command.

Controls...

opens the *Mesh Adaption Controls Dialog Box* (p. 2130), which allows you to control certain aspects of the adaption process.

Adapt

refines the mesh based on either the maximum volume or the volume change, and the adaption limits.

Mark

marks cells to be refined based on either the maximum volume or the volume change. This command produces an adaption register. For information on using adaption registers, see *Manipulating Adaption Registers* (p. 1343).

Compute

calculates the minimum and maximum cell volume or cell volume change and displays them in the **Min** and **Max** real number fields.

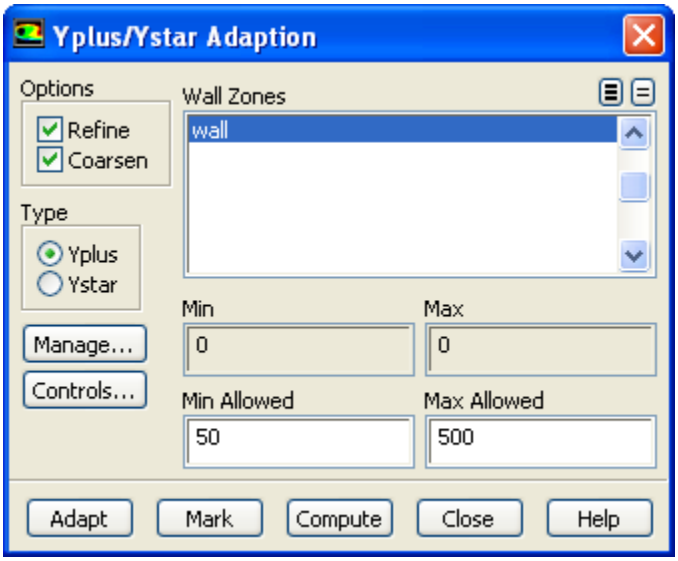
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.5.6. Adapt/Yplus/Ystar...

The **Adapt/Yplus/Ystar...** menu item opens the *Yplus/Ystar Adaption Dialog Box* (p. 2126).

36.5.6.1. Yplus/Ystar Adaption Dialog Box

The **Yplus/Ystar Adaption** dialog box allows you to mark or adapt boundary cells on specified wall zones based on the non-dimensional y^+ or y^* parameter. See *Yplus/Ystar Adaption* (p. 1338) for details.



Controls

Options

contains the check buttons that toggle the ability to mark and/or adapt cells for refinement or coarsening.

Refine

toggles the ability to refine cells or mark cells for refinement.

Coarsen

toggles the ability to coarsen cells or mark cells for coarsening.

Type

contains the check buttons that enable adaption based on y^+ or y^*.

Yplus

enables y^+ adaption.

Ystar

enables y^* adaption.

Wall Zones

contains a selectable list of active wall zones. Boundary cells associated with the wall zones you select will be marked or adapted based on the options, thresholds, and limitations applied in the dialog box.

Min/Max

displays the minimum and maximum cell values of y^+ or y^* for all cells associated with viscous wall zones. Note that these values are independent of the wall zones selected. The real number field values are not editable; they are purely informational.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Min Allowed

designates the threshold value for coarsening the mesh. Cells with y^+ or y^* values below the minimum threshold will be marked for coarsening.

Max Allowed

designates the threshold value for refining the mesh. Cells with y^+ or y^* values above the maximum threshold will be marked for refinement.

Manage...

opens the *Manage Adaption Registers Dialog Box* (p. 2129), which allows you to display and manipulate adaption registers that are generated using the **Mark** command.

Controls...

opens the *Mesh Adaption Controls Dialog Box* (p. 2130), which allows you to control certain aspects of the adaption process.

Adapt

adapts the mesh based the coarsening and refining toggle buttons, the wall zones selected, the minimum and maximum y^+ or y^* allowed, and the adaption limits.

Mark

marks cells to be refined and/or coarsened based on the wall zones selected and the minimum and maximum y^+ or y^* allowed in the mesh. This command produces an adaption register. For information on using adaption registers, see *Manipulating Adaption Registers* (p. 1343).

Compute

computes the minimum and maximum values of y^+ or y^* on all cells on viscous walls and displays them in the **Min** and **Max** real number fields. Note that these are the extremes for the y^+ or y^* values of every cell on a viscous wall, not just the cells associated with the selected zones.

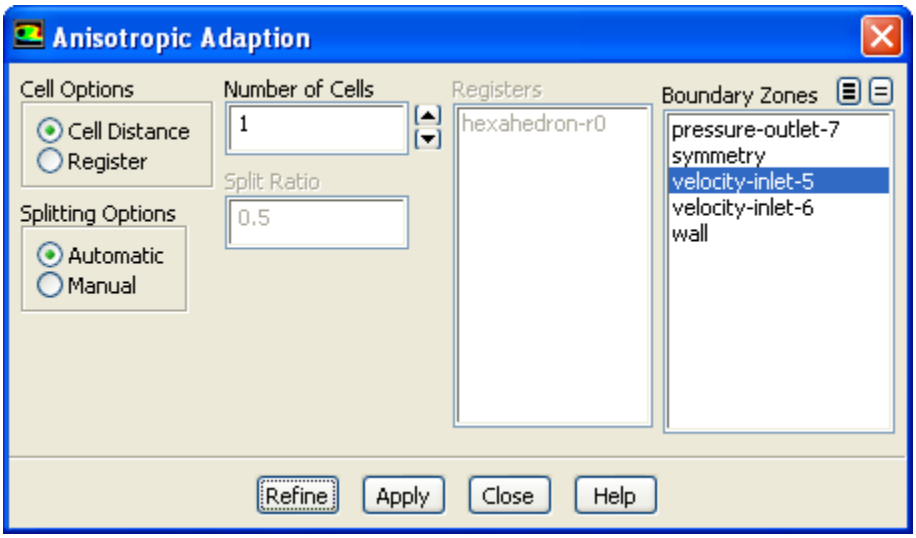
36.5.7. Adapt/Anisotropic...

The **Adapt/Anisotropic...** menu item opens the *Anisotropic Adaption Dialog Box* (p. 2127).

36.5.7.1. Anisotropic Adaption Dialog Box

The **Anisotropic Adaption** dialog box allows you to perform anisotropic adaption for certain cell types. See *Anisotropic Adaption* (p. 1339) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Cell Options
controls the marking of boundary layer cells.

Cell Distance
indicates adaption using the distance of the marked cell to the boundary zone.

Register
indicates adaption using an existing register.

Splitting Options
control how the splitting ratio is computed.

Automatic
allows the ratio to be computed automatically from the mesh.

Manual
allows you to enter a specific value for the ratio in the **Split Ratio** field.

Number of Cells
indicates the number of cells to be adapted and marked (available only when the **Cell Distance** option is enabled).

Split Ratio
allows you to specify a value for the split ratio (available only when the **Manual** splitting option is enabled).

Registers
provides a list of existing registers (available only when the **Register** option is enabled).

Boundary Zones
contains a list of available boundary zones.

Refine
refines the marked cells.

36.5.8. Adapt/Manage...

The **Adapt/Manage...** menu item opens the *Manage Adaption Registers Dialog Box* (p. 2129).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.5.8.1. Manage Adaption Registers Dialog Box

The **Manage Adaption Registers** dialog box provides an interactive mechanism for creating, destroying, and displaying functions for mesh adaption. See *Manipulating Adaption Registers* (p. 1343) for details about using the items in this dialog box.

Controls

Register Actions

contains operations applied to adaption or mask registers.

Change Type

toggles the register between adaption and mask types. Adaption registers are used to initiate refining or coarsening of the mesh. Typically, mask registers are combined with adaption registers to control the scope of the adaption process.

Combine

combines the selected adaption registers to create a hybrid adaption function. In some instances, three new registers may be created: a combination of the adaption registers, a combination of the mask registers, and then a combination of the two combined registers.

Delete

permanently discards the selected registers.

Mark Actions

contains operations applied to the cell markings defined in an adaption or mask register.

Exchange

modifies the cell markings in the following manner: all cells originally marked for refinement are marked for coarsening, and all cells originally marked for coarsening are marked for refinement.

Invert

modifies all the cell markings in a mask register in the following manner: all cells that were originally marked as ACTIVE are marked INACTIVE, and all cells originally marked as INACTIVE are marked ACTIVE. Note that this action can only be applied to mask registers.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Limit
applies the adaption volume limits to the selected registers. For information on adaption limits, see *Mesh Adaption Controls* (p. 1347).

Fill
marks for coarsening all cells in the adaption register that are not marked for refinement.

Registers
contains a list from which you can select the current adaption and mask registers. Many of the actions in the dialog box are activated or deactivated based on the number and/or type of adaption registers selected.

Register Info
provides the name, ID, number of cells marked for refinement and coarsening, and the type of the most recently selected or deselected register.

Options...
opens the *Adaption Display Options Dialog Box* (p. 2134).

Controls...
opens the *Mesh Adaption Controls Dialog Box* (p. 2130), which allows you to control certain aspects of the adaption process.

Adapt
adapts the mesh based on the selected adaption register. The **Adapt** button is deactivated if more than one adaption register is selected. Adaption functions composed of combinations of adaption registers can be produced using commands in the **Register Actions** and **Mark Actions** boxes.

Display
displays the cells marked for adaption in the selected adaption register in the active graphics window. The **Display** button is deactivated if more than one adaption register is selected. Adaption functions composed of combinations of adaption registers can be produced using commands in the **Register Actions** and **Mark Actions** boxes.

36.5.9. Adapt/Controls...

The **Adapt/Controls...** menu item opens the *Mesh Adaption Controls Dialog Box* (p. 2130).

36.5.9.1. Mesh Adaption Controls Dialog Box

The **Mesh Adaption Controls** dialog box allows you to set limits on the minimum cell size, the minimum and maximum number of cells, and the cell types that can be adapted. In addition, it allows you to vary the volume weighting of the gradient adaption function. See *Mesh Adaption Controls* (p. 1347) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

Options
contains check buttons that control the manner in which the mesh can be adapted.

Refine
toggles mesh adaption by adding points.

Coarsen
toggles mesh adaption by removing points.

Zones
contains a list of cell zones from which you can select the zones in which to perform adaption (or marking). By default, all cell zones are selected.

Min Cell Volume
restricts the size of the cell that is considered for refinement. Even if the cell is marked for refinement, it will not be refined if its cell volume is less than this threshold value.

Min # of Cells
specifies the minimum number of cells required in the mesh.

Max # of Cells
limits the total number of cells allowed in the mesh. A value of zero places no limits on the number of cells.

Max Level of Refine
specifies the maximum level of refinement for the cells.

Volume Weight
controls the volume weighting in the gradient adaption function. Valid values are between 0 and 1: 0 for no volume weighting and 1 for full volume weighting.

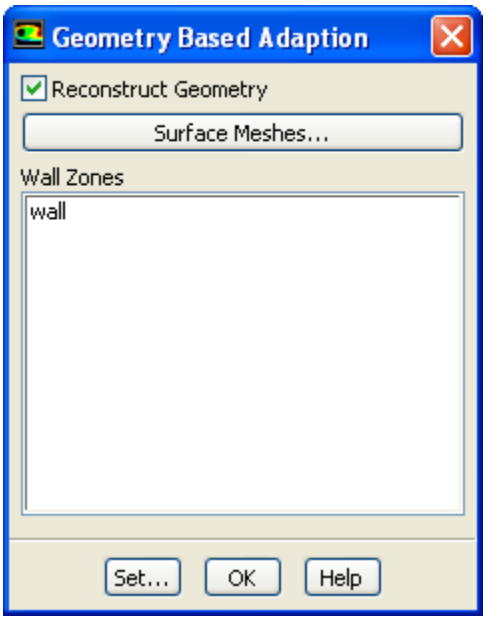
36.5.10. Adapt/Geometry...

The **Adapt/Geometry...** menu item opens the *Geometry Based Adaption Dialog Box* (p. 2132).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.5.10.1. Geometry Based Adaption Dialog Box

The **Geometry Based Adaption** dialog box allows you to reconstruct the geometry while performing boundary adaption. See *Geometry-Based Adaption* (p. 1341) for details.



Controls

Reconstruct Geometry
enables geometry based adaption parameters.

Surface Meshes...
opens the *Surface Meshes Dialog Box* (p. 2132).

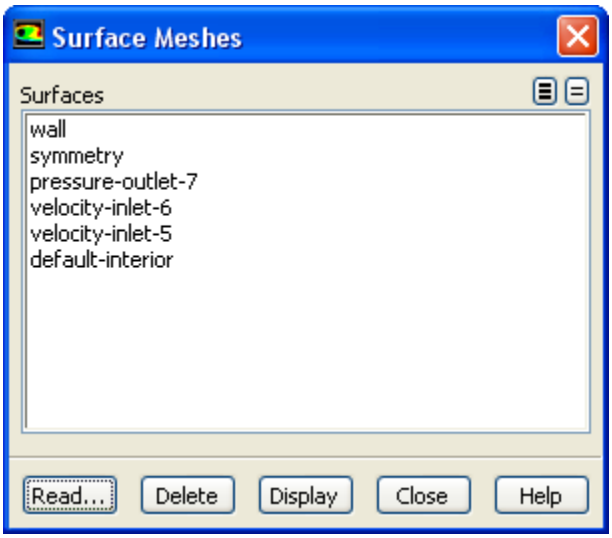
Wall Zones
allows you to select the wall zones you want to adapt.

Set...
opens the *Geometry Based Adaption Controls Dialog Box* (p. 2133).

36.5.10.2. Surface Meshes Dialog Box

The **Surface Meshes** dialog box allows you to read the surface meshes in ANSYS FLUENT (See *Reading Surface Mesh Files* (p. 160) for details on reading surface meshes.)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Surfaces
contains a list of the surfaces available in the surface mesh you read.

*You can select/deselect the surfaces listed under **Surfaces**.*

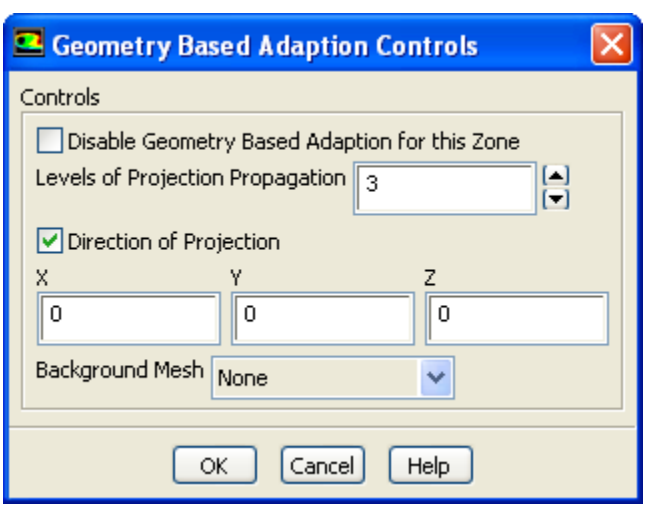
Read...
opens the **Select File** dialog box in which you can select the surface mesh you want to read.

Delete
allows you to delete the selected surfaces under **Surfaces** area.

Display
allows you to display the selected surfaces under **Surfaces**.

36.5.10.3. Geometry Based Adaption Controls Dialog Box

The **Geometry Based Adaption Controls** dialog box allows you to set projections. It is opened from the *Geometry Based Adaption Dialog Box* (p. 2132). See *Performing Geometry-Based Adaption* (p. 1341) for details about the items below.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

contains parameters to define geometry based adaption.

Disable Geometry Based Adaption for this Zone

disables the geometry reconstruction for selected zones in the domain.

Levels of Projection Propagation

is the number of layers of the nodes you want to project.

Direction of Projection

allows you to specify the direction in which you want to project the nodes.

Background Mesh

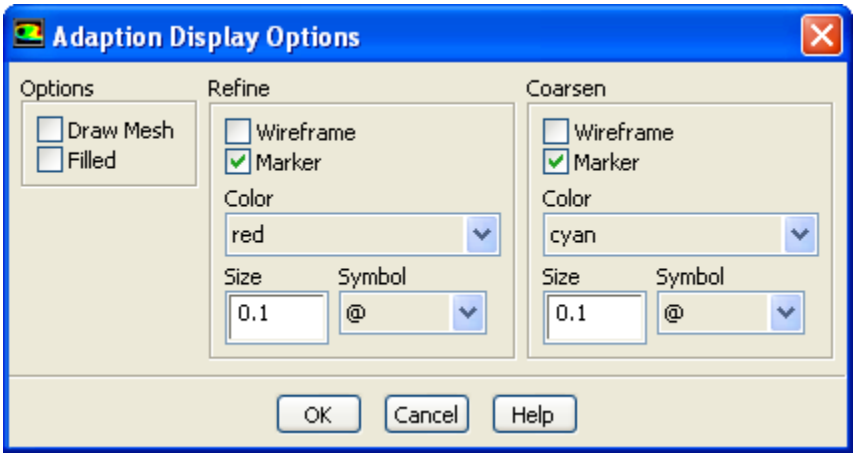
allows you to load the surface mesh as a background mesh for adaption.

36.5.11. Adapt/Display Options...

The **Adapt/Display Options...** menu item opens the *Adaption Display Options Dialog Box* (p. 2134).

36.5.11.1. Adaption Display Options Dialog Box

The **Adaption Display Options** dialog box allows you to customize the display of adaption or mask registers. See *Adaption Display Options* (p. 1346) for details about the items below.



Controls

Options

contains check buttons that control the drawing of the mesh and the type of graphical tool used to display flagged cells.

Draw Mesh

toggles the ability to draw the mesh with the adaption display. This command opens the *Mesh Display Dialog Box* (p. 1635), which allows you to select the desired surface or zone meshes to be displayed with the markings.

Filled

toggles the solid shading of the cell wireframe.

Refine

contains options related to the display of cells marked for refinement.

Wireframe

toggles the display of the cell wireframe for cells flagged for refinement.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Marker
toggles the display of the cell marker for cells flagged for refinement.

Color
is a drop-down list of colors for the wireframe or marker for the cells marked for refinement.

Size
is a real number entry for the size of the refine cell marker. A symbol of size 1.0 is 3.0% of the height of the display screen.

Symbol
is a drop-down list of symbols that can be used for the refine cell marker.

Coarsen
contains options related to the display of cells marked for refinement.

Wireframe
toggles the display of the cell wireframe for cells flagged for coarsening.

Marker
toggles the display of the cell marker for cells flagged for coarsening.

Color
is a drop-down list of colors for the wireframe or marker for the cells marked for coarsening.

Size
is a real number entry for the size of the coarsen cell marker. A symbol of size 1.0 is 3.0% of the height of the display screen.

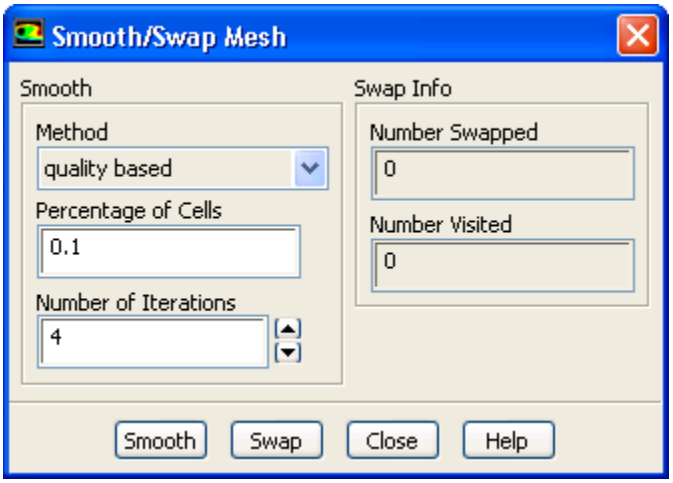
Symbol
is a drop-down list of symbols that can be used for the coarsen cell marker.

36.5.12. Adapt/Smooth/Swap...

The **Adapt/Smooth/Swap...** menu item opens the *Smooth/Swap Mesh Dialog Box* (p. 2135).

36.5.12.1. Smooth/Swap Mesh Dialog Box

The **Smooth/Swap Mesh** dialog box controls smoothing and face swapping of the numerical mesh. See *Improving the Mesh by Smoothing and Swapping* (p. 1349) for details about the items below.



Controls

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Smooth

contains parameters associated with smoothing the mesh.

Method

indicates whether the quality-based, Laplacian, or the skewness-based smoothing method is to be used. Select **quality based**, **laplace**, or **skewness** from the drop-down list. Note that only the **quality based** item is available for parallel cases.

Percentage of Cells

(for quality-based smoothing) sets the percentage of the total cells on which improvements are attempted. Note that the cells selected for improvement are in the areas of the mesh that exhibit the lowest orthogonal quality. This field appears when **quality based** is selected as the smoothing method.

Relaxation Factor

(for Laplacian smoothing) sets the factor by which to multiply the computed position increment for the node. The lower the factor, the more reduction in node movement. This field appears when **laplace** is selected as the smoothing method.

Skewness Threshold

(for skewness-based smoothing) sets the minimum cell skewness value for which node smoothing will be attempted. ANSYS FLUENT will try to move interior nodes to improve the skewness of cells with skewness greater than this value. By default, **Skewness Threshold** is set to 0.8 for 3D or 0.4 for 2D. The **Skewness Threshold** field appears when **skewness** is selected as the smoothing method.

Number of Iterations

defines the number of successive smoothing sweeps performed on the mesh.

Swap Info

provides information on the most recent face-swapping operation. This group box is only available for serial cases.

Number Swapped

displays the number of faces that were swapped based on the Delaunay circle test.

Number Visited

displays the total number of faces that were visited and tested for possible face swapping.

Smooth

initiates the desired number of smoothing iterations.

Swap

exchanges the faces of cells for which the circle test is not satisfied.

36.6. Surface Menu

For additional information, please see the following sections:

36.6.1. Surface/Zone...
36.6.2. Surface/Partition...
36.6.3. Surface/Point...
36.6.4. Surface/Line/Rake...
36.6.5. Surface/Plane...
36.6.6. Surface/Quadric...
36.6.7. Surface/Iso-Surface...
36.6.8. Surface/Iso-Clip...
36.6.9. Surface/Transform...
36.6.10. Surface/Manage...

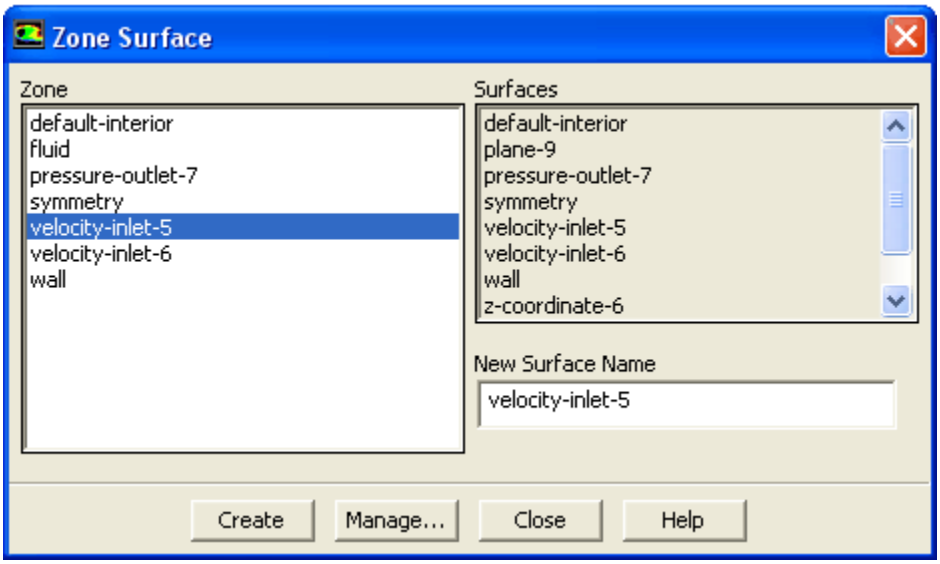
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.6.1. Surface/Zone...

The **Surface/Zone...** menu item opens the *Zone Surface Dialog Box* (p. 2137).

36.6.1.1. Zone Surface Dialog Box

The **Zone Surface** dialog box allows you to interactively create surfaces from face and cell zones in the domain. See *Zone Surfaces* (p. 1356) for details about the items below.



Controls

Zone
contains a list from which you can select the face or cell zone to be used for creating a zone surface.

Surfaces
displays an informational list of existing surfaces.

New Surface Name
designates the name of the surface to be created. The default is the zone name.

Create
creates the surface.

Manage...
opens the *Surfaces Dialog Box* (p. 1936) in which you can rename and delete surfaces and determine their sizes.

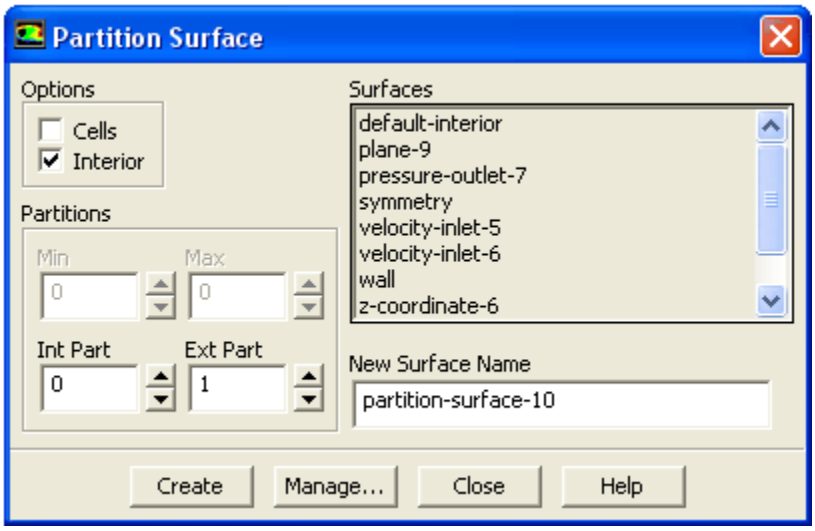
36.6.2. Surface/Partition...

The **Surface/Partition...** menu item opens the *Partition Surface Dialog Box* (p. 2137).

36.6.2.1. Partition Surface Dialog Box

The **Partition Surface** dialog box allows you to create a surface defined by the boundary of two adjacent mesh partitions. See *Partition Surfaces* (p. 1357) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Options

contains check buttons that allow you to choose interior or exterior faces or cells to be contained in the partition surface.

Cells

specifies, when enabled, that the partition surface will consist of cells (either interior or exterior, depending on the status of the **Interior** check button) that lie on the partition boundary. When this option is disabled, the faces on the boundary between partitions will make up the partition surface. Depending on the status of the **Interior** check button, the faces will reflect data values for the interior or exterior cells.

Interior

toggles between interior and exterior cells. If the partition surface consists of faces instead of cells, **Interior** specifies for which cells data will be displayed on the faces. When this option is enabled, interior cells (cells that are on the **Int Part** side of the partition boundary) will make up the partition surface. When it is disabled, the partition surface will consist of exterior cells (cells that are on the **Ext Part** side of the partition boundary).

Partitions

contains information about which partitions are under consideration. The boundary that defines the partition surface is the boundary between the **Int Part** and the **Ext Part**. If there are more than two mesh partitions, each interior partition will share boundaries with several exterior partitions. By setting the appropriate values for **Int Part** and **Ext Part**, you can create surfaces for any of these boundaries.

Min/Max

indicates the minimum and maximum ID numbers of the mesh partitions. The minimum is always zero, and the maximum is one less than the number of processors.

Int Part

indicates the ID number of the interior partition (i.e., the par tition under consideration).

Ext Part

indicates the ID number of the bordering partition.

Surfaces

displays an informational list of existing surfaces.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

New Surface Name
designates the name of the new surface. The default is the concatenation of the surface type and an integer which is the new surface ID.

Create
creates the surface.

Manage...
opens the *Surfaces Dialog Box* (p. 1936) in which you can rename and delete surfaces and determine their sizes.

36.6.3. Surface/Point...

The **Surface/Point...** menu item opens the *Point Surface Dialog Box* (p. 1927).

36.6.4. Surface/Line/Rake...

The **Surface/Line/Rake...** menu item opens the *Line/Rake Surface Dialog Box* (p. 1928).

36.6.5. Surface/Plane...

The **Surface/Plane...** menu item opens the *Plane Surface Dialog Box* (p. 1929).

36.6.6. Surface/Quadric...

The **Surface/Quadric...** menu item opens the *Quadric Surface Dialog Box* (p. 1931).

36.6.7. Surface/Iso-Surface...

The **Surface/Iso-Surface...** menu item opens the *Iso-Surface Dialog Box* (p. 1933).

36.6.8. Surface/Iso-Clip...

The **Surface/Iso-Clip...** menu item opens the *Iso-Clip Dialog Box* (p. 1935).

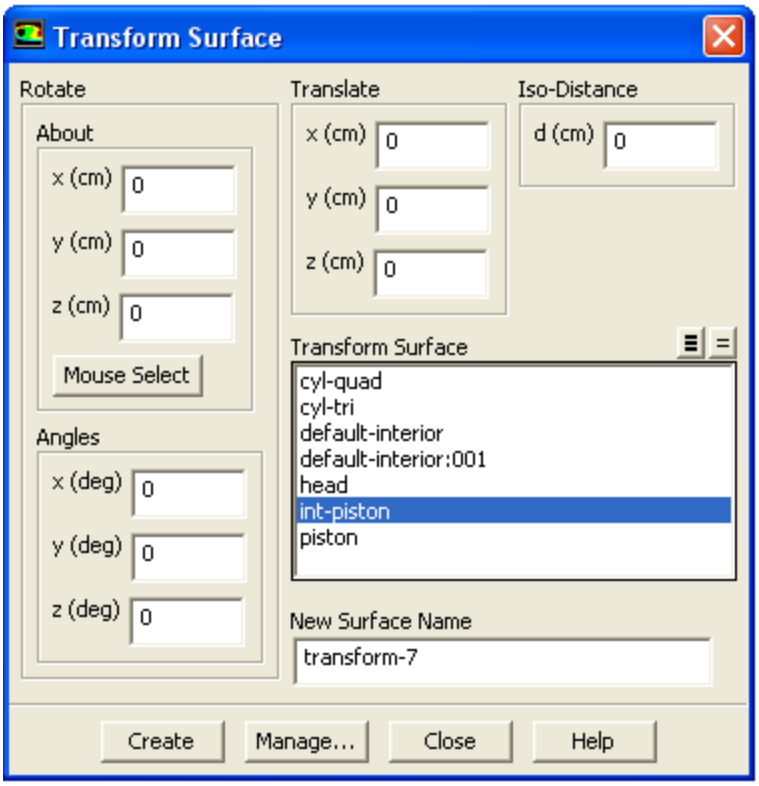
36.6.9. Surface/Transform...

The **Surface/Transform...** menu item opens the *Transform Surface Dialog Box* (p. 2139).

36.6.9.1. Transform Surface Dialog Box

The **Transform Surface** dialog box allows you to create a new data surface by rotating and/or translating an existing surface, and/or by specifying a constant normal distance from it. See *Transforming Surfaces* (p. 1375) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Rotate

contains the transformation parameters for rotation.

About

defines the origin about which the surface is rotated. You will specify a point, and the origin of the coordinate system for the rotation will be set to the specified point. For example, if you specified the point (1,0) in 2D, rotation would be about the z axis anchored at (1,0). You can either enter the point's coordinates in the **x,y,z** fields or click on the **Mouse Select** button and select a point in the graphics window using the mouse.

Angles

define the angles about the **x**, **y**, and **z** axes (i.e., the axes of the coordinate system with the origin defined under **About**) by which the surface is rotated. For 2D problems, you can specify rotation about the **z** axis only.

Translate

contains the transformation parameters for translation.

x,y,z

define the distance by which the surface is translated in each direction.

Iso-Distance

contains the transformation parameters for "isodistancing."

d

sets the normal distance between the original surface and the transformed surface.

Transform Surface

contains a list of existing surfaces from which you can select the surface to be transformed. The selected surface will remain unchanged; the transformation will create a new surface.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

New Surface Name
designates the name of the new surface. The default is the concatenation of the transformation type (i.e., iso-distance, rotate, or translate) and an integer which is the new surface ID.

Create
creates the surface.

Manage...
opens the *Surfaces Dialog Box* (p. 1936) in which you can rename and delete surfaces and determine their sizes.

36.6.10. Surface/Manage...

The **Surface/Manage...** menu item opens the *Surfaces Dialog Box* (p. 1936).

36.7. Display Menu

For additional information, please see the following sections:

36.7.1. Display/Mesh...
36.7.2. Display/Graphics and Animations...
36.7.3. Display/Plots...
36.7.4. Display/Residuals...
36.7.5. Display/Options...
36.7.6. Display/Scene...
36.7.7. Display/Views...
36.7.8. Display/Lights...
36.7.9. Display/Colormap...
36.7.10. Display/Annotate...
36.7.11. Display/Zone Motion...
36.7.12. Display/DTRM Graphics...
36.7.13. Display/Import Particle Data...
36.7.14. Display/PDF Tables/Curves...
36.7.15. Display/Video Control...
36.7.16. Display/Mouse Buttons...

36.7.1. Display/Mesh...

The **Display/Mesh...** menu item opens the *Mesh Display Dialog Box* (p. 1635).

36.7.2. Display/Graphics and Animations...

The **Display/Graphics and Animations...** menu item opens the *Graphics and Animations Task Page* (p. 1965).

36.7.3. Display/Plots...

The **Display/Plots...** menu item opens the *Plots Task Page* (p. 2011).

36.7.4. Display/Residuals...

The **Display/Residuals...** menu item opens the *Residual Monitors Dialog Box* (p. 1915).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.7.5. Display/Options...

The **Display/Options...** menu item opens the *Display Options Dialog Box* (p. 1992).

36.7.6. Display/Scene...

The **Display/Scene...** menu item opens the *Scene Description Dialog Box* (p. 1994). This menu item becomes available when you display meshes, surfaces, contours, vectors, or pathlines in the graphics window.

36.7.7. Display/Views...

The **Display/Views...** menu item opens the *Views Dialog Box* (p. 2000).

36.7.8. Display/Lights...

The **Display/Lights...** menu item opens the *Lights Dialog Box* (p. 2005).

36.7.9. Display/Colormap...

The **Display/Colormap...** menu item opens the *Colormap Dialog Box* (p. 2007).

36.7.10. Display/Annotate...

The **Display/Annotate...** menu item opens the *Annotate Dialog Box* (p. 2010).

36.7.11. Display/Zone Motion...

The **Display/Zone Motion...** menu item opens the *Zone Motion Dialog Box* (p. 1895). This option is available for all dynamic mesh models.

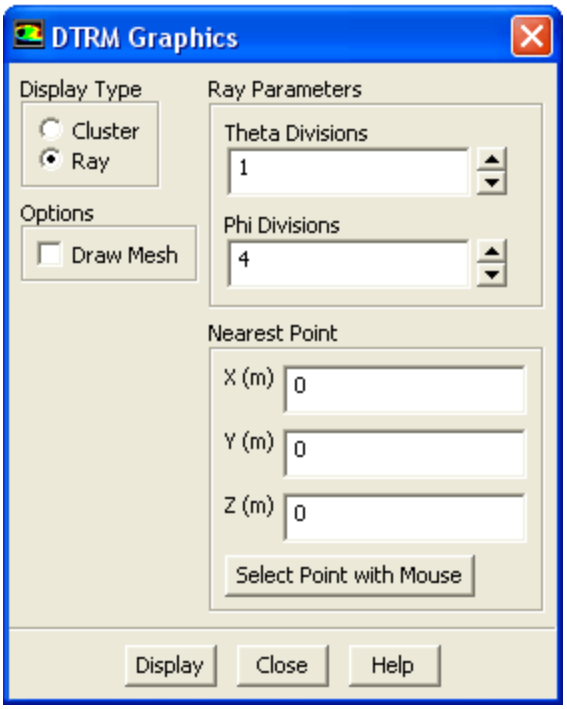
36.7.12. Display/DTRM Graphics...

The **Display/DTRM Graphics...** menu item opens the *DTRM Graphics Dialog Box* (p. 2142).

36.7.12.1. DTRM Graphics Dialog Box

The **DTRM Graphics** dialog box allows you to display rays and clusters used by the DTRM. See *Displaying Rays and Clusters for the DTRM* (p. 738) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Display Type
contains options for the different items you can display.

Cluster
specifies the display of clusters.

Ray
specifies the display of rays.

Options
contains check buttons that control display options.

Draw Mesh
toggles between displaying and not displaying the mesh. The *Mesh Display Dialog Box* (p. 1635) is opened when **Draw Mesh** is selected.

Cluster Type
specifies whether **Surface** clusters or **Volume** clusters are to be displayed. This section of the dialog box appears when **Cluster** is selected as the **Display Type**.

Cluster Selection
contains options for cluster displays. This section of the dialog box appears when **Cluster** is selected as the **Display Type**.

Display All Clusters
enables the display of all surface or volume clusters in the domain.

Ray Parameters
contains controls for displaying rays. This section of the dialog box appears when **Ray** is selected as the **Display Type**.

Theta Divisions, Phi Divisions
control the number of rays being traced. (See *Controlling the Rays* (p. 708).)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Nearest Point
specifies a point (**X,Y,Z**) near the cluster to be displayed (or the cluster from which the rays should start).

The **Nearest Point** controls are not available when **Display All Clusters** is selected under **Cluster Selection**.

Select Point With Mouse
is an alternative method for specifying the **Nearest Point** using your mouse, by clicking the button.

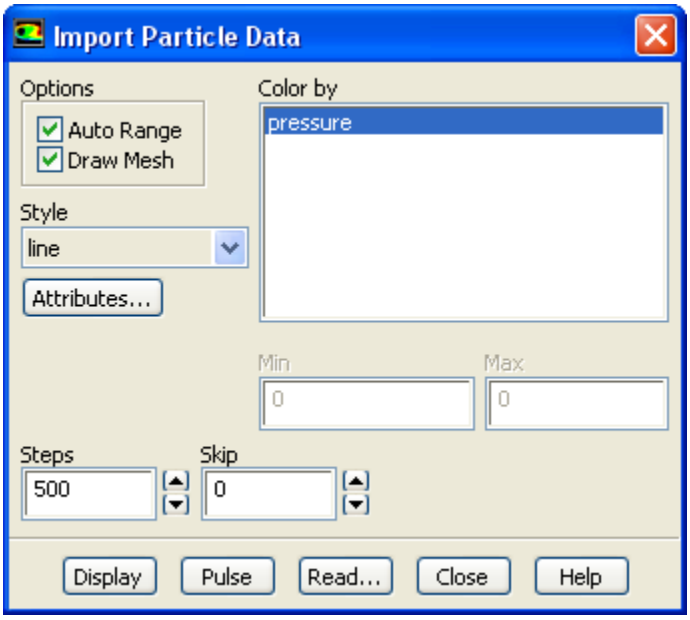
Display
displays the specified cluster(s) or rays.

36.7.13. Display/Import Particle Data...

The **Display/Import Particle Data...** menu item opens the *Import Particle Data Dialog Box* (p. 2144).

36.7.13.1. Import Particle Data Dialog Box

The **Import Particle Data** dialog box allows you to import particle history data for display purposes. See *Importing Particle Data* (p. 1070) for details.



Controls

Options
contains the check buttons that set various import particle data options.

Auto Range
toggles between automatic and manual setting of the particle data range.

Draw Mesh
toggles between displaying and not displaying the mesh. The *Mesh Display Dialog Box* (p. 1635) is opened when **Draw Mesh** is selected.

Style
allows you to select pathline style.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Attributes...
opens the *Path Style Attributes Dialog Box* (p. 1979). This allows you to modify the line width, cylinder radius or marker size.

Color by
contains a list from which you can select the scalar field to be used to color the particle data.

Min,Max
allows you to set the range when **Auto Range** is disabled.

Steps
sets the maximum number of steps a particle can advance.

Skip
allows you to "thin out" the pathlines.

Display
displays pathlines.

Pulse
animates the particle positions. The **Pulse** button will become the **Stop !** button during the animation, and you must click **Stop !** to stop the pulsing.

Read...
opens a file selection dialog box where you can enter a file name and a directory for the imported data.

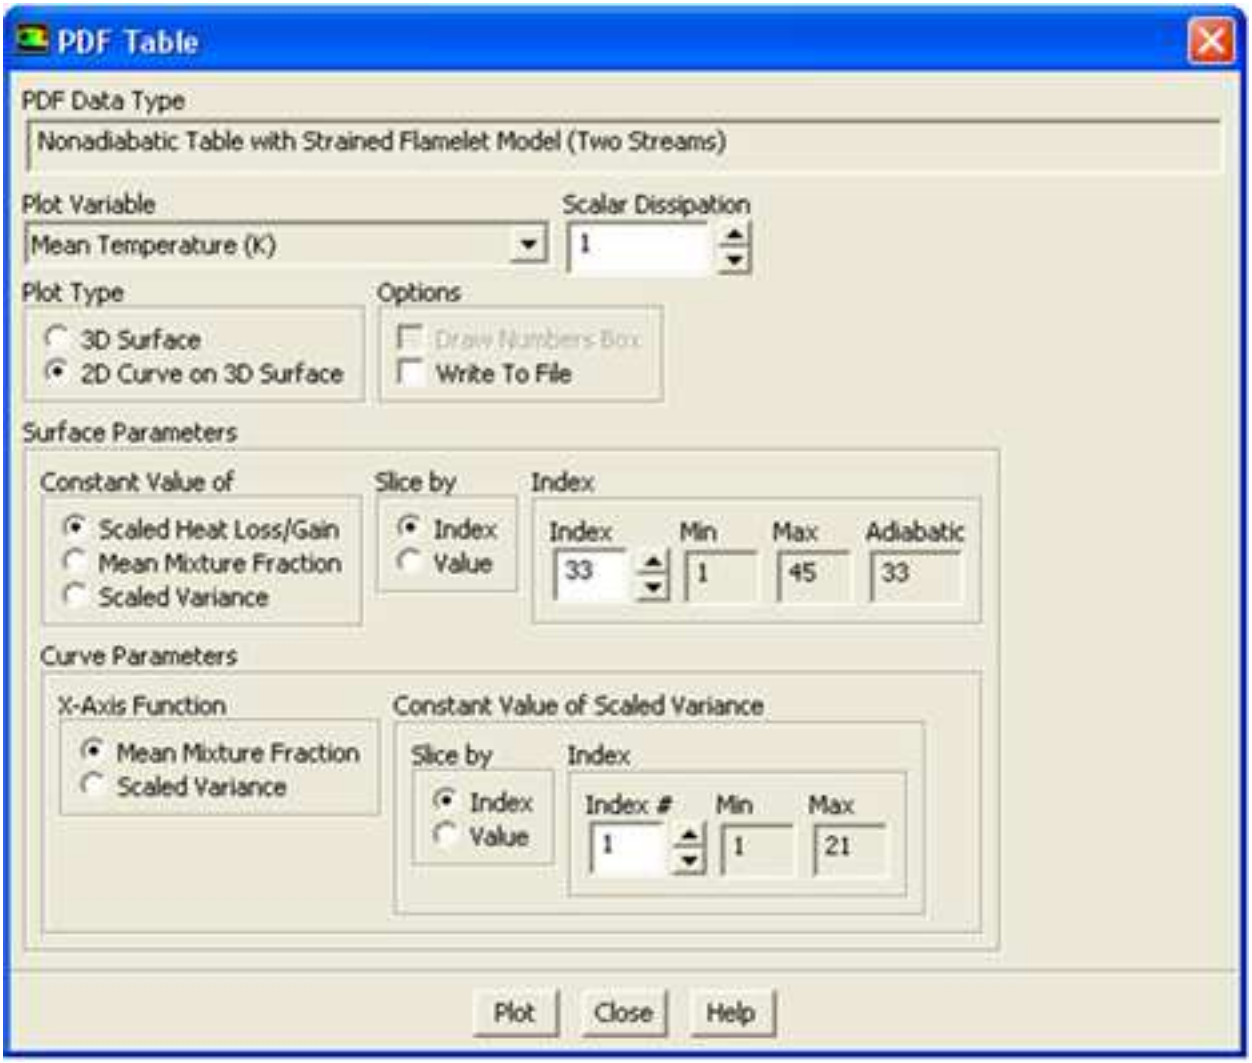
36.7.14. Display/PDF Tables/Curves...

The **Display/PDF Tables/Curves...** menu item opens the *PDF Table Dialog Box* (p. 2145).

36.7.14.1. PDF Table Dialog Box

You can display 2D plots and 3D surfaces showing the variation of species mole fraction, density, or temperature with the mean mixture fraction, mixture fraction variance, or enthalpy. See *Postprocessing the Look-Up Table Data* (p. 874) for details about the items below.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

PDF Data Type
describes the system that you are displaying.

Plot Variable
contains a drop-down list from which you can select temperature, density, or species fraction as the variable to be plotted.

Scalar Dissipation
specifies the value of the **Scalar Dissipation** which is available for multiple flamelets only.

Plot Type
gives you the choice of plotting a 3D surface or a slice of a 3D surface.

3D Surface
displays a 3D plot of the variation of species mole fraction, density, or temperature with the mean mixture fraction, mixture fraction variance, or enthalpy.

2D Curve on 3D Surface
consists of a 2D curve which is a slice of a 3D surface.

Options
contains options specific to the display of 3D surfaces or 2D curves on 3D surfaces.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Draw Numbers Box
enabling this option displays a wireframe box with the numerical limits in each coordinate direction. This option is available only when **3D Surface** is selected.

Write To File
specifies whether you want to write the plot data to a file. This option is available only when **2D Curve on 3D Surface** is selected. The **Plot** button changes to a **Write** button when this option is enabled.

Surface Parameters
contains settings where discrete independent variables are held constant and where curve parameters are defined.

Constant Value of
specifies the discrete independent variable to be held constant in the lookup table. The choices are **Scaled Heat Loss/Gain**, **MeanMixtureFraction**,or **Scaled Variance**. For a two-mixture-fraction case, the **Scaled Heat Loss/Gain** is the only available option.

Slice by
allows you to select whether the 3D array of data points available in the look-up table will be sliced by **Index** or **Value**.

Index/Value
contains index/values and their ranges.

Index/Value
allows you to specify the discretization index or numerical value of the variable that is being held constant.

Min/Max
are the range of integer values that you are allowed to choose from or display.

Adiabatic
is the enthalpy slice index corresponding to the adiabatic case for which the enthalpy (**Scaled Heat Loss/Gain**) is held constant.

Curve Parameters
allows you to specify the **X-Axis Function** against which the plot variable will be displayed when **2D Curve on 3D Surface** is selected.

X-Axis Function
allows you to select **Mean Mixture Fraction** or **Scaled Variance** against which the plot variable will be displayed.

Constant Value of Scaled Variance/Mean Mixture Fraction
allows you to specify the type of discretization for the variable that is being held constant.

Slice by
allows you to select whether the 3D array of data points available in the look-up table will be sliced by **Index** or **Value**.

Index/Value
contains index/values and their ranges.

Index#/Value
allows you to specify the discretization index or numerical value of the variable that is being held constant for the curve parameters.

Min/Max
are the range of integer values that you are allowed to choose from or display.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Display
displays the plot variable of the 3D surface.

Plot
plots the plot variable for the 2D curve on 3D surface.

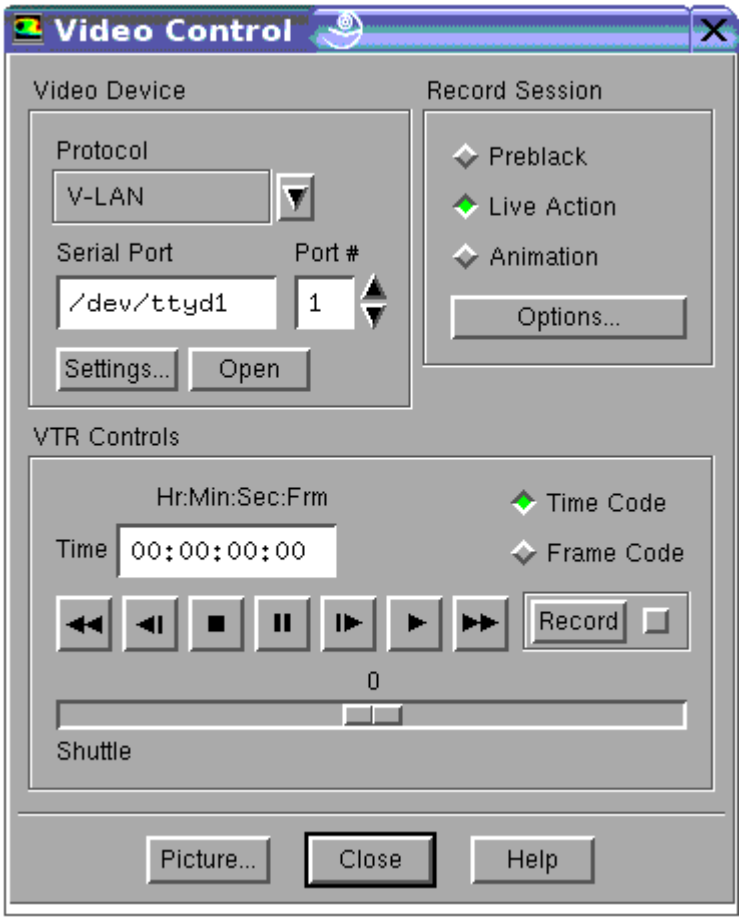
Write
opens the *The **Select File** Dialog Box* (p. 33) where you will specify a name for the file containing plot data. This button appears when **Write To File** is enabled for the **2D Curve on 3D Surface** plot type.

36.7.15. Display/Video Control...

The **Display/Video Control...** menu item opens the *Video Control Dialog Box* (p. 2148) (Linux/UNIX only).

36.7.15.1. Video Control Dialog Box

The **Video Control** dialog box is used to record animations or live action to video. When recording animations to video, you must first create your animation (see *Creating an Animation* (p. 1455)). The **Video Control** dialog box will play your animation and control a videotape recorder (VTR) to record it to video. See *Creating Videos* (p. 1458) for details about using the video tools.



Controls

Video Device
sets up the connection to the VTR control hardware.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Protocol

specifies the command protocol that identifies your VTR controller. ANSYS FLUENT currently supports the following VTR controllers:

V-LAN

Machine Control Network is a command protocol developed by Videomedia, Inc. and supported by several videotape editing systems.

MiniVAS

is the command protocol for the MiniVAS and MiniVAS-2 VTR controllers developed by the V.A.S. Group.

To be able to control the video recording from ANSYS FLUENT, your VTR controller must use one of these protocols.

Serial Port

identifies the name of the serial port to which your VTR controller is connected.

Port #

is a convenient way of changing the port number associated with the serial port.

Settings...

displays a dialog box that provides options specific to your VTR controller. If your VTR controller protocol is V-LAN, the *V-LAN Settings Dialog Box* (p. 2150) is displayed; if the protocol is MiniVAS, the *MiniVAS Settings Dialog Box* (p. 2152) is displayed.

Open

will open a connection to your VTR controller. Once the connection is open, the name of this push button will be changed to **Close** so that you can close the connection again.

Record Session

specifies the type of recording you want to perform.

Preblack

is the process of formatting a tape by laying down a time code onto the tape. A tape must be formatted before any frame accurate editing, including frame-by-frame animation, can be performed. During this process, one usually records a black video signal onto the tape as well, thus the name "preblack". When you select this option the current graphics window will be cleared to black. You can use the window to send your black video signal to the VTR. Remember, when you preblack a previously formatted tape, a new time code will be written and any previously recorded video will be destroyed.

Live Action

allows you to record a live ANSYS FLUENT session which can be used for demonstration. This option requires your computer's video hardware to have a scan converter that will send the computer display image to your VTR system.

Animation

will play an animation that you have created, and record it onto your VTR system.

Options...

displays the *Animation Recording Options Dialog Box* (p. 2153), which provides options for recording your animation.

VTR Controls

function like the controls on your VTR's front dialog box.

Time

is a counter that provides input/output of the current tape position. It will update automatically when the tape is repositioned. If you type a new time in this field and press `Enter`, the VTR will go

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

to that position on the tape. For time code, the format is Hrs:Min:Sec:Frames, where the number of frames can range between 0 and 29. For example, a time code of `00:02:36:07` is 2 minutes, 36 seconds, and 7 frames. In order to go to this position on the tape, you can enter the time code as `2:36:07`, leaving out the leading zeros, or you can simply enter `23607`, leaving out the leading zeros and colons. If you select the **Frame Code** radio button, the tape position will be displayed in frames instead of time.

Record
will begin a recording session starting at the current position on the tape. If **Preblack** has been selected as the recording session, the label of this push button will be changed to **Preblack**.

Push Button Controls
enable you to operate the VTR's tape transport.

<<	rewinds the tape.
<|	reverses the tape by one frame.
[ ]	places the tape in stop mode.
||	places the tape in pause mode.
|>	advances the tape by one frame.
>	plays the tape at normal speed.
>>	advances the tape in fast-forward mode.

Shuttle
allows you to advance (or reverse) the tape at varying speeds. When you move the shuttle to the right, the tape will be advanced; when you move it to the left, the tape will be reversed. The shuttle speed index ranges from -9 to 9. A speed index of 5 is equivalent to playing the tape at normal speed. A speed index of 0 is equivalent placing the tape in pause mode.

Counter Format
allows you to change the counter units displayed in the **Time/Frame** counter.

Time Code
when selected, displays the tape position as time code.

Frame Code
when selected, displays the tape position as frame code.

This format is for display/user-input purposes only and does not change the actual tape counter format.

Picture...
displays the *Picture Options Dialog Box* (p. 2155), which provides options for setting the picture size and color levels in the graphics window.

36.7.15.2. V-LAN Settings Dialog Box

The **V-LAN Settings** dialog box allows you to set specific V-LAN options. This dialog box is displayed by clicking on the **Settings...** push button in the *Video Control Dialog Box* (p. 2148), after you have selected V-LAN as your video device protocol.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Controls

V-LAN Node

identifies the node number of the VTR. This is always 1, unless you have several video devices connected to a V-LAN network, in which case, the VTR you want to use may be identified by another node number.

VTR Video Format

identifies the video format standard to which your VTR conforms. This setting is used to determine the video frame rate (frames/sec).

NTSC

(National Television Standards Committee) is the main video standard used in North America and Japan. The video frame rate is 30 frames/sec.

PAL

(Phase Alternate Line) is the video standard used by some countries in Western Europe, Asia, and Australia. The video frame rate is 25 frames/sec.

Preroll/Postroll

specifies the preroll and postroll times in seconds. These are used when performing **Edit** records, including frame-by-frame animation recording, to make sure the tape is moving at the proper speed through the recorded segment.

Preroll

is the number of seconds the tape will play up to the record in point.

Postroll

is the number of seconds the tape will play past the record out point.

The default settings should be sufficient for most VTR devices.

Live/Real-Time Recording

specifies the type of recording that will be performed during a live action or real-time animation recording session.

Quick Record

can be performed on a tape that has not been formatted or "preblacked". This is also known as "full record". Remember that this option will destroy any pre-existing time code on the tape.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Edit (Preblacked Tape Required)
is used for more precise recording. This mode allows you to record several back-to-back recordings with clean transitions between them.

For frame-by-frame animation recording, the record mode used is **Edit** regardless of this setting.

Verbose Mode
enables the echoing of each V-LAN command as it is sent to the V-LAN controller.

36.7.15.3. MiniVAS Settings Dialog Box

The **MiniVAS Settings** dialog box allows you to set specific MiniVAS options. This dialog box is displayed by clicking on the **Settings...** push button in the *Video Control Dialog Box* (p. 2148), after you have selected MiniVAS as your video device protocol.

Controls

VTR Identification
identifies the type of VTR the MiniVAS is connected to. The identification is a two-character code reserved for your VTR model (see your MiniVAS documentation for details). If left blank, this field is ignored and the MiniVAS will use the code that has been permanently stored in its ROM. It is recommended that you leave this field blank unless you know that a code change is required. If you open this dialog box after opening a connection to the MiniVAS, this field will contain the code that is stored in the MiniVAS.

VTR Video Format
identifies the video format standard to which your VTR conforms. This setting is used to determine the video frame rate (frames/sec).

NTSC
(National Television Standards Committee) is the main video format used in North America and Japan. The video frame rate is 30 frames/sec.

PAL
(Phase Alternate Line) is the video format used by some countries in Western Europe, Asia, and Australia. The video frame rate is 25 frames/sec.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

VTR Tape Format
specifies which counter format to use for editing. MiniVAS provides commands based on both time code and frame code.

Time Code
instructs MiniVAS to control the VTR using time code.

Frame Code
instructs MiniVAS to control the VTR using frame code.

Preroll
specifies the preroll time in seconds. This is used when performing **Edit** records, including frame-by-frame animation recording, to make sure the tape is moving at the proper speed through the recorded segment. The value given is the number of seconds the tape will play up to the record in point. The default setting should be sufficient for most VTR devices.

Preblack Mode
specifies the mode used when you perform a preblack recording session.

Preblack
instructs the MiniVAS to perform a "hard" record on a previously unformatted tape. During this operation, the MiniVAS will command the VTR to write both a time code and a VIFC frame code to the tape.

Prestripe
instructs the MiniVAS to perform an "edit" record on a previously formatted tape that already has a time code. During this operation, the MiniVAS will command the VTR to write a VIFC frame code to the tape.

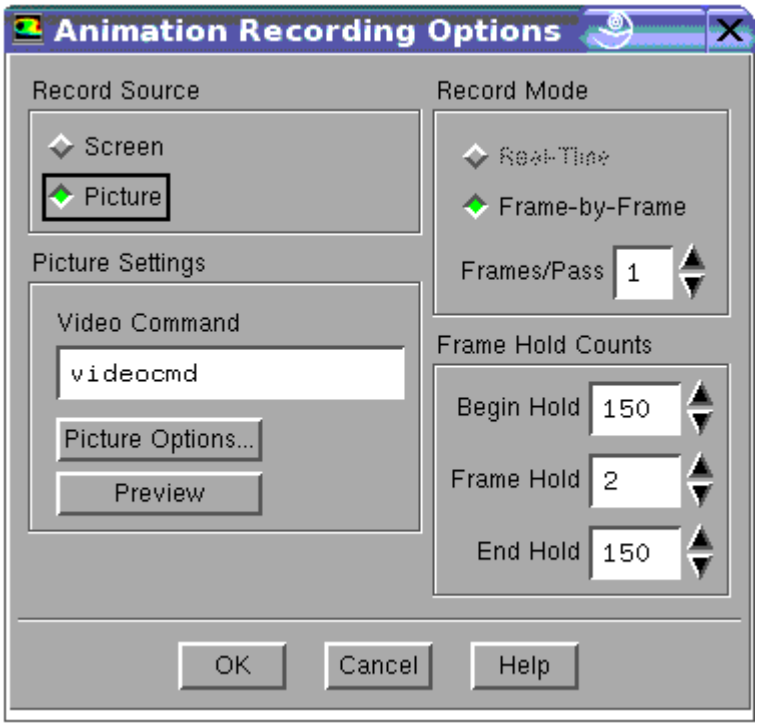
In either case, any previously recorded video will be destroyed.

Verbose Mode
enables the echoing of each MiniVAS command as it is sent to the MiniVAS controller.

36.7.15.4. Animation Recording Options Dialog Box

The **Animation Recording Options** dialog box allows you to set specific options for recording animations to video. An animation is created using the *Animate Dialog Box* (p. 1986).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Record Source

identifies the video source used during a recording session.

Screen

informs ANSYS FLUENT that the computer's video hardware will send all or a portion of the computer screen as a video signal to the VTR. This option assumes your computer's video system includes a scan converter and associated software that converts the computer RGB signal to a video signal. You are responsible for setting up the scan converter and sending the video signal to the VTR.

Picture

instructs ANSYS FLUENT to create a picture of each frame of animation and send the picture file to the computer's video hardware using a system command. This option assumes that your computer's video system includes a frame buffer that can store an image and send it as a video signal to the video recording system.

Picture Settings

is used in conjunction with the **Picture** record source option.

Video Command

identifies the shell script command file used to send a picture file to the video frame buffer. The default setting is `videocmd`, which is a shell script that is included in your ANSYS FLUENT distribution. It is located in *path* `/Fluent.Inc/bin`, where *path* is the directory in which you have placed the release directory, `Fluent.Inc`. This shell script will execute your system's command to send an image file to the video frame buffer. The script `videocmd` is set up to call the SGI system command `memtovid`. If you have a different system, you must copy the shell script `videocmd` to a new file and modify it to perform the proper task on your system (see the comments in `videocmd` for details).

Picture Options...

displays the *Save Picture Dialog Box* (p. 1988), which allows you to set up the picture format supported by your video frame buffer. If you choose to perform a window dump to create the picture file, the default window dump command used will also be `videocmd`. You can change this setting to use

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

your own command. After setting the picture options, click on **Apply** instead of **Save...**in the *Save Picture Dialog Box* (p. 1988) to effect the change.

Preview
will send a test picture of the current graphics picture to the video frame buffer. This can be used to check the image on your video recording system's monitor to see if the image size and color levels are acceptable.

Record Mode
specifies the method used to record the animation.

Real-Time
can be used if the animation playback speed is fast enough to provide a reasonably smooth animation in real-time. This is only available if the selected record source is **Screen**. In this mode, ANSYS FLUENT will simply turn VTR recording on, play the animation, then stop the recording.

Frame-By-Frame
is used to produce a higher-quality video animation by recording one frame at a time. For each animation frame, this method will 1) play the frame on the screen (and generate the picture file, if needed), 2) preroll the VTR, and 3) record the frame. If the animation has 50 frames, this procedure is repeated 50 times, i.e., 50 record passes are made. This is the recommended method, because the real-time playback of the animation will usually be too slow and choppy.

Frames/Pass
is used in conjunction with **Frame-By-Frame** recording to try and speed up this process, if possible. It specifies the number of animation frames recorded to tape per record pass. If the animation is long enough (200 frames or more), you can try setting this value to 2 or higher. For example, if you set this value to 2 for a 202-frame animation, it will record animation frame 1 during the first pass, frames 2 and 102 during the second pass, frames 3 and 103 during the third pass, and so on. This is possible only if the animation frames can be rendered in time to be inserted onto the tape during a record pass, so use this setting with caution.

Frame Hold Counts
specifies the number of video frames to hold an animation frame during recording. The video standard NTSC has a frame rate of 30 frames/sec. At that rate, a 150-frame animation will take only 5 seconds to play. To stretch out the animation, you can record the same animation frame over 2 or more video frames.

Begin Hold
specifies the number of video frames to hold the first animation frame. It helps to hold the first frame for about 5 seconds (150 video frames) so that the viewer can get accustomed to the picture before the animation begins.

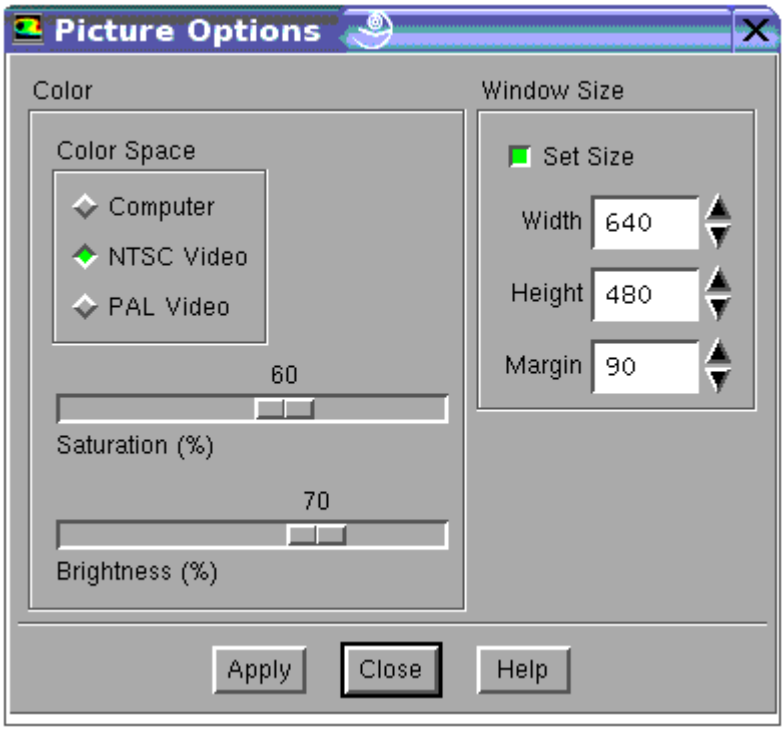
Frame Hold
specifies the number of video frames to hold each animation frame, other than the first and last. To slow down your recorded animation, try setting this value to 2 or 3.

End Hold
specifies the number of video frames to hold the last animation frame. You may want to hold the last animation frame for about 5 seconds to provide closure.

36.7.15.5. Picture Options Dialog Box

The **Picture Options** dialog box allows you to adjust the color levels and size of the picture in the graphics window. This dialog box has an **Apply** push button, so as you adjust levels, you can click on **Apply** to see the effect on the picture in the current graphics window. Each option has a presetting, so you can click on **Apply** immediately to see the effect of the presettings.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Color

contains options for adjusting the color levels of the picture.

Color Space

lets you choose a filter that will restrict all colors to within a particular color range by modifying individual color values, if needed.

Computer

when selected, effectively turns off color filtering.

NTSC Video

when selected, restricts colors to the NTSC color space. NTSC (National Television Standards Committee) is the main video format used in North America and Japan.

PAL Video

when selected, restricts colors to the PAL color space. PAL (Phase Alternate Line) is the video format used by some countries in Western Europe, Asia, and Australia.

Saturation (%)

controls the percentage of color saturation (or purity) of the colors in the picture. A saturation in the range of 0-20% produces grayed-out colors. A saturation in the range of 40-60% produces pastel colors. A saturation in the range of 80-100% produces vivid colors. For video, this value should be no more than 80%.

Brightness (%)

controls the color brightness of the picture. When lowering the saturation, it is often desirable to lower the brightness a little bit as well to avoid pastel colors.

Window Size

allows you to resize the graphics window so that you can match up the size to your VTR device.

Set Size

lets you decide whether or not you want the **Width**, **Height**, and **Margin** values to be used to resize the graphics window.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Width
specifies the width in pixels of the new window size.

Height
specifies the height in pixels of the new window size.

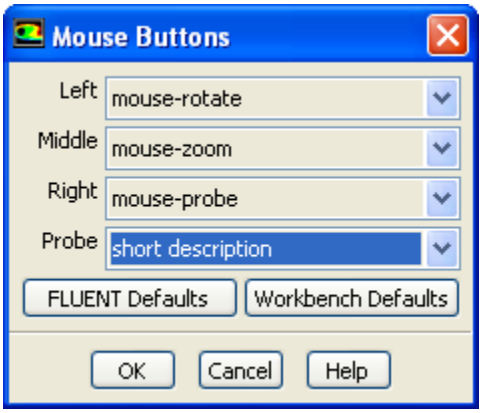
Margin
specifies a margin in pixels to create around the picture. This can help you produce a video image that does not include unwanted parts of the screen, such as the window border.

36.7.16. Display/Mouse Buttons...

The **Display/Mouse Buttons...** menu item opens the *Mouse Buttons Dialog Box* (p. 2157).

36.7.16.1. Mouse Buttons Dialog Box

The **Mouse Buttons** dialog box is used to set the actions taken when one of the mouse buttons is clicked in a graphics window. See *Controlling the Mouse Button Functions* (p. 1427) for details.



Controls

Left
sets the function associated with the left button. In 2D the default setting is **mouse-dolly**, and in 3D it is **mouse-rotate**.

Middle
sets the function associated with the middle button. The default setting for both 2D and 3D is **mouse-zoom**.

Right
sets the function associated with the right button. This button is not used on a two button mouse. The default setting for both 2D and 3D is **mouse-probe**.

Probe
turns the probe function on and off.

FLUENT Defaults
sets the left, middle, right, and probe buttons as described above.

Workbench Defaults
sets the mouse buttons as follows:

Left
In 2D and 3D the default setting is **mouse-dolly**.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Middle
In 2D the default setting is **mouse-rotate** and in 3D it is **mouse-probe**.

Right
In 2D and 3D the default setting is **mouse-zoom**.

Probe
turns the probe function on and off.

36.8. Report Menu

For additional information, please see the following sections:

36.8.1. Report/Result Reports...
36.8.2. Report/Input Summary...
36.8.3. Report/S2S Information...
36.8.4. Report/Reference Values...

36.8.1. Report/Result Reports...

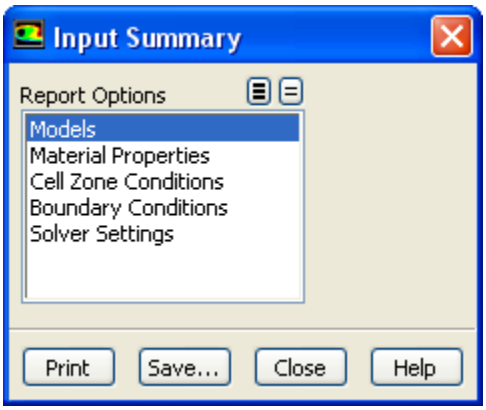
The **Report/Result Reports...** menu item opens the *Reports Task Page* (p. 2026).

36.8.2. Report/Input Summary...

The **Report/Input Summary...** menu item opens the *Input Summary Dialog Box* (p. 2158).

36.8.2.1. Input Summary Dialog Box

The **Input Summary** dialog box allows you to report the current settings for physical models, boundary conditions, material properties, and solution parameters. See *Generating a Summary Report* (p. 1525) for details about the items below.



Controls

Report Options
contains a selectable list of the information that is available for the report.

Print
prints the selected information to the console.

Save...
opens the *The **Select File** Dialog Box* (p. 33), in which you can specify the filename under which to save the output of the summary report.

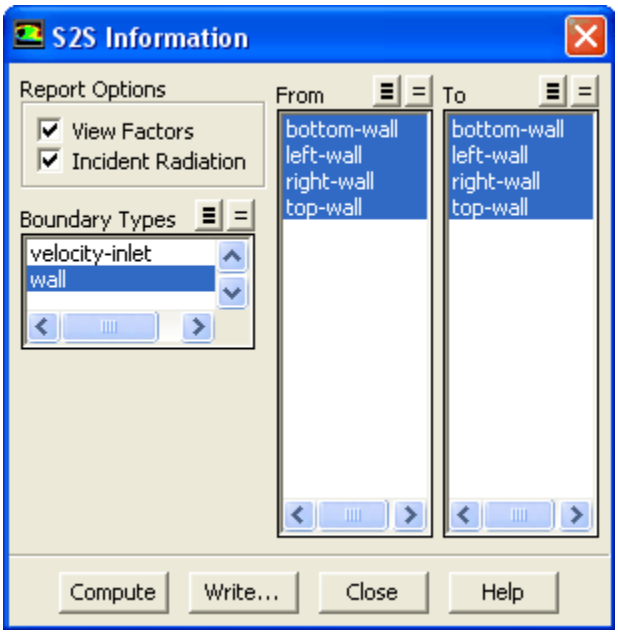
Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.8.3. Report/S2S Information...

The **Report/S2S Information...** menu item opens the *S2S Information Dialog Box* (p. 2159).

36.8.3.1. S2S Information Dialog Box

The **S2S Information** dialog box allows you to report values of the view factor and radiation emitted from one zone to any other zone. See *Reporting Radiation in the S2S Model* (p. 739) for details about the items below.



Controls

Report Options
contains items for which information is available for reporting.

View Factors
turns on the computation of view factors from one zone to the other.

Incident Radiation
turns on the computation of the incident radiation from one zone to the other.

Boundary Types
contains a selectable list of types of boundary zones. If you select (or deselect) an item in this list, all zones of that type will be selected (or deselected) automatically in the **From** and **To** lists.

From
contains a selectable list of boundary zones for which you would like data reported from the selected zone.

To
contains a selectable list of boundary zones for which you would like data reported to the selected zone.

Compute
computes the view factors and/or incident radiation on the selected zones.

Write...
opens the *The **Select File** Dialog Box* (p. 33), which you can use to save the data as an S2S Info File (`.sif` format).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.8.4. Report/Reference Values...

The **Report/Reference Values...** menu item opens the *Reference Values Task Page* (p. 1898).

36.9. Parallel Menu

For additional information, please see the following sections:

36.9.1. Parallel/Auto Partition...
36.9.2. Parallel/Partitioning and Load Balancing...
36.9.3. Parallel/Thread Control...
36.9.4. Parallel/Network/Database...
36.9.5. Parallel/Network/Configure...
36.9.6. Parallel/Network/Show Connectivity...
36.9.7. Parallel/Network/Show Latency
36.9.8. Parallel/Network/Show Bandwidth
36.9.9. Parallel/Timer/Usage
36.9.10. Parallel/Timer/Reset

36.9.1. Parallel/Auto Partition...

The **Parallel/Auto Partition...** menu item opens the *Auto Partition Mesh Dialog Box* (p. 2160).

36.9.1.1. Auto Partition Mesh Dialog Box

The **Auto Partition Mesh** dialog box allows you to set the parameters for automatic partitioning when reading an unpartitioned mesh into the parallel solver. See *Partitioning the Mesh Automatically* (p. 1604) for details.

Controls

Method

contains a drop-down list of the recursive partition methods that can be used to create the mesh partitions. The choices include the **Cartesian Axes**, **Cartesian Strip**, **Cartesian X-Coordinate**, **Cartesian Y-Coordinate**, **Cartesian Z-Coordinate**, **Cartesian R Axes**, **Cartesian RX-Coordinate**, **Cartesian RY-Coordinate**, **Cartesian RZ-Coordinate**, **Cylindrical Axes**, **Cylindrical R-Coordinate**, **Cylindrical Theta-Coordinate**, **Cylindrical Z-Coordinate**, **Metis**, **Polar Axes**, **Polar R-Coordinate**, **Polar Theta-Coordinate**, **Principal Axes**, **Principal Strip**, **Principal X-Coordinate**, **Principal Y-Coordinate**, **Principal Z-Coordinate**, **Spherical Axes**, **Spherical Rho-Coordinate**, **Spherical Theta-Coordinate**, and **Spherical Phi-Coordinate** techniques, which are described in *Mesh Partitioning Methods* (p. 1616).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Case File

allows you to use a valid existing partition section in a case file (i.e., one where the number of partitions in the case file divides evenly into the number of compute nodes). You need to turn off the **Case File** option only if you want to change other parameters in the **Auto Partition Mesh** dialog box.

Across Zones

allows partitions to cross zone boundaries (the default). If turned off, it will restrict partitioning to within each cell zone. This is recommended *only* when cells in different zones require significantly different amounts of computation during the solution phase, for example if the domain contains both solid and fluid zones.

Optimizations

contains a toggle button to activate pre-testing.

Pre-Test

instructs the solver to test all coordinate directions and choose the one which yields the fewest partition interfaces for the final bisection. Note that this option is available only when you choose **Principal Axes** or **Cartesian Axes** as the partitioning method.

36.9.2. Parallel/Partitioning and Load Balancing...

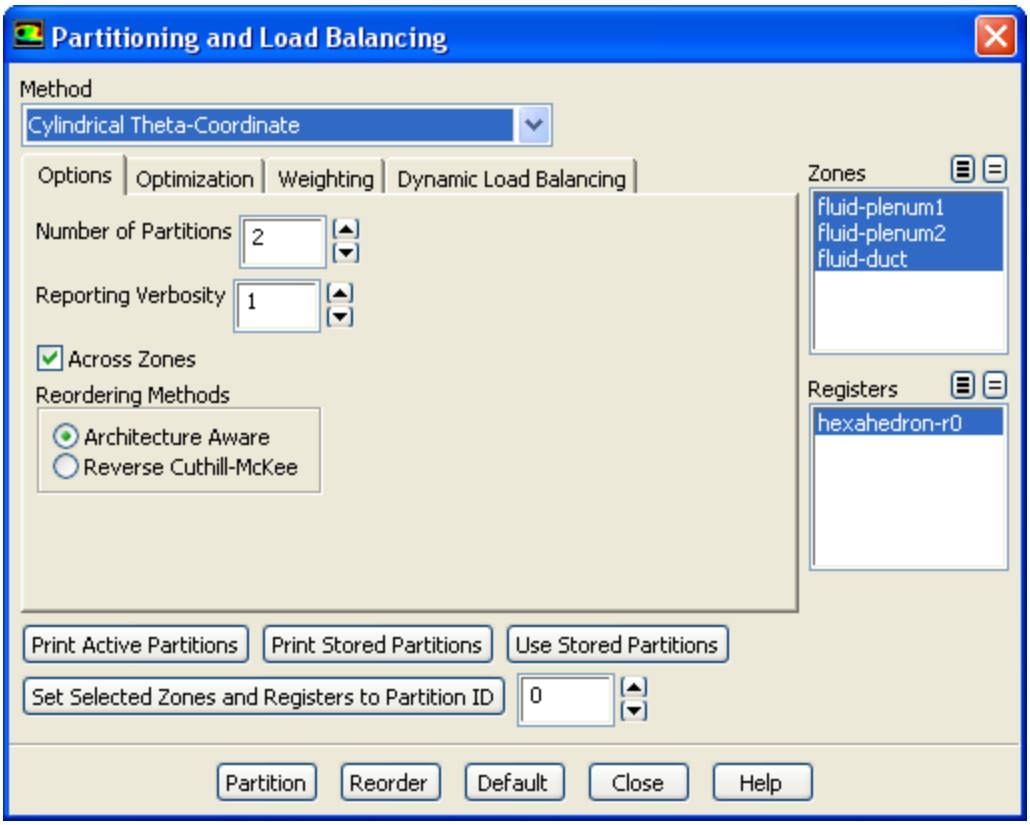
The **Parallel/Partitioning and Load Balancing...** menu item opens the *Partitioning and Load Balancing Dialog Box* (p. 2161).

36.9.2.1. Partitioning and Load Balancing Dialog Box

The **Partitioning and Load Balancing** dialog box allows you to partition the mesh into separate clusters of cells for separate processors on a parallel computer. Note that the **Partitioning and Load Balancing** dialog box is slightly different in the serial and parallel solvers. See *Partitioning the Mesh Manually and Balancing the Load* (p. 1605) for details.

The **Partitioning and Load Balancing** dialog box also allows you to enable and control ANSYS FLUENT's load balancing feature. Load balancing will automatically detect and analyze parallel performance, and re-distribute cells between the existing compute nodes to optimize it. See *Load Balancing* (p. 1614) for more information about load balancing.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Method

contains a drop-down list of the recursive partition methods that can be used to create the mesh partitions. The choices include the **Cartesian Axes**, **Cartesian Strip**, **Cartesian X-Coordinate**, **Cartesian Y-Coordinate**, **Cartesian Z-Coordinate**, **Cartesian R Axes**, **Cartesian RX-Coordinate**, **Cartesian RY-Coordinate**, **Cartesian RZ-Coordinate**, **Cylindrical Axes**, **Cylindrical R-Coordinate**, **Cylindrical Theta-Coordinate**, **Cylindrical Z-Coordinate**, **Metis**, **Polar Axes**, **Polar R-Coordinate**, **Polar Theta-Coordinate**, **Principal Axes**, **Principal Strip**, **Principal X-Coordinate**, **Principal Y-Coordinate**, **Principal Z-Coordinate**, **Spherical Axes**, **Spherical Rho-Coordinate**, **Spherical Theta-Coordinate**, and **Spherical Phi-Coordinate** techniques, which are described in *Mesh Partitioning Methods* (p. 1616).

Options

tab

Number of Partitions

defines the desired number of mesh partitions. This usually matches the number of processors available for parallel computing.

Reporting Verbosity

specifies the amount of information to be reported in the text (console) window during the partitioning. With the default value of 1, the solver will print the number of partitions created, the number of bisections performed, the time required for the partitioning, and the minimum and maximum cell, face, interface, and face-ratio variations. (See *Interpreting Partition Statistics* (p. 1622) for details.) If you increase the **Reporting Verbosity** to 2, the partition method used, the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each partition will also be printed in the console window. If you decrease the **Reporting Verbosity** to 0, only the number of partitions created and the time required for the partitioning will be reported.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Across Zones
allows partitions to cross zone boundaries (the default). If turned off, it will restrict partitioning to within each cell zone. This is recommended *only* when cells in different zones require significantly different amounts of computation during the solution phase, for example if the domain contains both solid and fluid zones.

Reordering Method
is used to optimize parallel performance

Architecture Aware
is the default option and it accounts for the system architecture and network topology in remapping the partitions to the processors.

Reverse Cuthill-McKee
minimizes the bandwidth of the compute-node connectivity matrix (the maximum distance between two connected processes) without incorporating the system architecture.

Optimization
tab contains toggle buttons for activating schemes to optimize the partitions created by the selected partition method. In addition, the optimization scheme will be applied until appropriate criteria are met, or the maximum number of iterations have been executed. If the **Iterations** counter is set to 0, the optimization scheme will be applied until completion, without limit on the maximum number of iterations.

Merge
attempts to decrease the number of interfaces by eliminating orphan cell clusters (an orphan cluster is a group of connected cells whose members each have at least one face coincident with an interface boundary).

Smooth
attempts to minimize the number of interfaces by sacrificing cells on the partition boundary to the neighboring partition to reduce the partition boundary surface area.

Pre-Test
instructs the solver to test all coordinate directions and choose the one which yields the fewest partition interfaces for the final bisection. Note that this option is available only when you choose **Principal Axes** or **Cartesian Axes** as the partitioning method.

Weighting
tab allows you to set the appropriate weights, prior to partitioning the mesh.

Weight Types
allows you to turn on/off a specific weight. Weight types include: **Faces per Cell** (which is enabled by default, with additional weighting of **2**), **Solid Zones** (available only if solid cell zones are defined); **VOF** (available only if the volume of fluid multiphase model is turned on); **DPM** (available only for discrete phase simulations with injections defined); and **ISAT**.

User-Specified
allows you to use the default value (by not selecting the check box), or to specify a value yourself (by selecting the check box and entering a numerical value in the **Value** field.

Value
allows you to enter a user-specified numerical value that either defines the ratio used in the weighting, or (for the **Faces per Cell** weighting) is added to the calculated weight of each cell.

Dynamic Load Balancing
tab allows you to set load balancing thresholds and intervals.

Physical Models
allows you to set thresholds and intervals for the simulation's physical models.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Threshold
is a percentage and depending on the value, load balancing will occur if the load imbalance is greater than the value entered.

Interval
allows you to specify the desired interval for load balancing cycles, in terms of number of iterations. When a value of 0 is specified, ANSYS FLUENT will internally determine the best value to use, initially using an interval of 25 iterations. You can override this behavior by specifying a non-zero value. ANSYS FLUENT will then attempt to perform load balancing after every N iterations, where N is the specified **Balance Interval**.

Dynamic Mesh
allows you to set load balancing threshold and interval values for your dynamic mesh. This option is only available when the dynamic mesh model is enabled.

Auto
allows a percentage of interface faces and loads to be automatically traced.

Threshold
is a percentage and depending on the value, load balancing will occur if the load imbalance is greater than the value entered.

Interval
allows you to specify the desired interval for load balancing cycles, in terms of number of iterations. When a value of 0 is specified, ANSYS FLUENT will internally determine the best value to use, initially using an interval of 25 iterations. You can override this behavior by specifying a non-zero value. ANSYS FLUENT will then attempt to perform load balancing after every N iterations, where N is the specified **Balance Interval**.

Mesh Adaption
allows you to set threshold values for mesh adaption.

Threshold
is a percentage and depending on the value, load balancing will occur if the load imbalance is greater than the value entered.

Zones
contains a list of cell zones. Partitioning will be applied to cells in zones selected from this list.

Registers
contains a list of cell registers that have been created using the adaption tools. You can restrict partitioning to a group of cells by selecting a register containing the cells. See *Partitioning Within Zones or Registers* (p. 1613) for details.

Print Active Partitions
(parallel solver only) prints the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each active partition (see *Checking the Partitions* (p. 1622) for information about active partitions) in the console window. In addition, it prints the minimum and maximum cell, face, interface, and face-ratio variations.

Print Stored Partitions
(parallel solver only) prints the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each stored partition (see *Checking the Partitions* (p. 1622) for information about stored partitions) in the console window. In addition, it prints the minimum and maximum cell, face, interface, and face-ratio variations.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Print Partitions

(serial solver only) prints the partition ID, number of cells, faces, and interfaces, and the ratio of interfaces to faces for each stored partition in the console window. In addition, it prints the minimum and maximum cell, face, interface, and face-ratio variations.

Set Selected Zones and Registers to Partition ID

allows you to set a value which assigns selected **Zones** and/or **Registers** to a specific partition ID. A region or zone is marked before setting the marked cells to one of the partition IDs.

Use Stored Partitions

(parallel solver only) allows you to make the stored cell partitions the active cell partitions. The active cell partition is used for the current calculation, while the stored cell partition (the last partition performed) is used when you save a case file.

Partition

subdivides the mesh into the selected number of partitions using the prescribed method and optimization(s).

Default

sets all controls to their default values, as assigned by ANSYS FLUENT. After execution, the **Default** button becomes the **Reset** button.

Reset

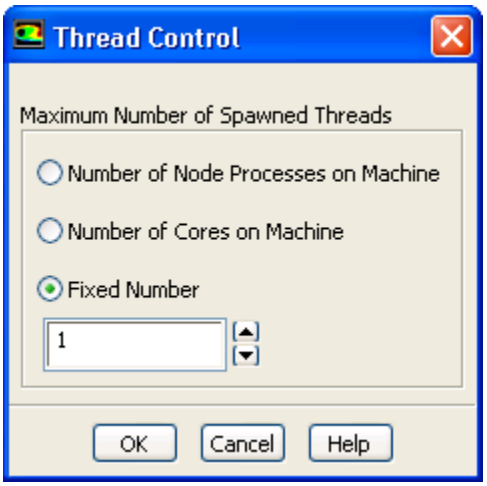
resets the fields to their most recently saved values (i.e., the values before **Default** was selected). After execution, the **Reset** button becomes the **Default** button.

36.9.3. Parallel/Thread Control...

The **Parallel/Thread Control...** menu item opens the *Thread Control Dialog Box* (p. 2165).

36.9.3.1. Thread Control Dialog Box

The **Thread Control** dialog box allows you to control the maximum number of threads on each machine, as described in *Controlling the Threads* (p. 1625).



Controls

Maximum Number of Spawned Threads

contains a list of options for defining the maximum number of threads on each machine.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Number of Node Processes on Machine
specifies that the maximum number of threads on each machine is equal to the number of ANSYS FLUENT node processes on each machine.

Number of Cores on Machine
specifies that the maximum number of threads on each machine is equal to the number of cores on the machine. ANSYS FLUENT obtains the number of cores from the OS.

Fixed Number
specifies that the maximum number of threads that can be spawned on each machine is equal to the number you provide in the number-entry box below **Fixed Number**.

36.9.4. Parallel/Network/Database...

The **Parallel/Network/Database...** menu item opens the *Hosts Database Dialog Box* (p. 2166).

Important

The ability to read a hosts file using the **Hosts Database** dialog box is only available when using the `net` option (e.g., `-mpi=net`). While this feature is still available in ANSYS FLUENT 6.3, its use is discouraged.

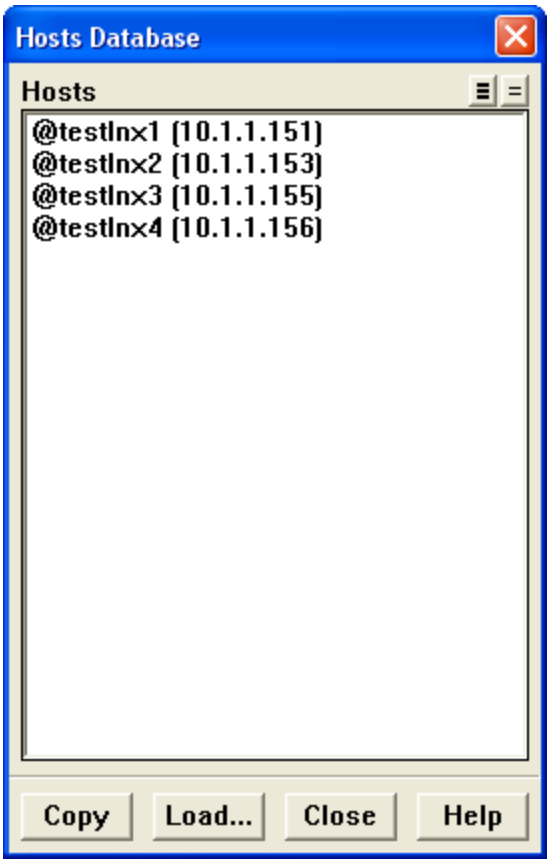
36.9.4.1. Hosts Database Dialog Box

When you are creating a parallel network of workstations, it is convenient to start with a list of machines that are part of your local network (a "hosts file"). You can load a file containing these names into the hosts database and then select the hosts that are available for creating a parallel configuration (or network) on a cluster of workstations.

The **Hosts Database** dialog box allows you to read a hosts file and copy selected entries to the list of available hosts in the *Network Configuration Dialog Box* (p. 2168).

Parallel → Network → **Database...**

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Hosts

contains a selectable list of local host names. The default list consists of the hosts in your `fluent.hosts` or `.fluent.hosts` file, if you have one in your home directory. You can load other hosts files using the **Load** button.

If the hosts file exists in your home directory, its contents are automatically added to the hosts database at startup. Otherwise, the hosts database will be empty until you read in a hosts file.

Once the contents of the hosts file have been read, the host names will appear in the **Hosts** list. (ANSYS FLUENT will automatically add the IP (Internet Protocol) address for each recognized machine. If a machine is not currently on the local network, it will be labeled **unknown**.)

Copy

copies selected entries to the list of available hosts in the *Network Configuration Dialog Box* (p. 2168) on which you can spawn nodes.

Load...

opens the *The **Select File** Dialog Box* (p. 33), which allows you to read a hosts file containing a list of local host names.

36.9.5. Parallel/Network/Configure...

The **Parallel/Network/Configure...** menu item opens the *Network Configuration Dialog Box* (p. 2168).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Important

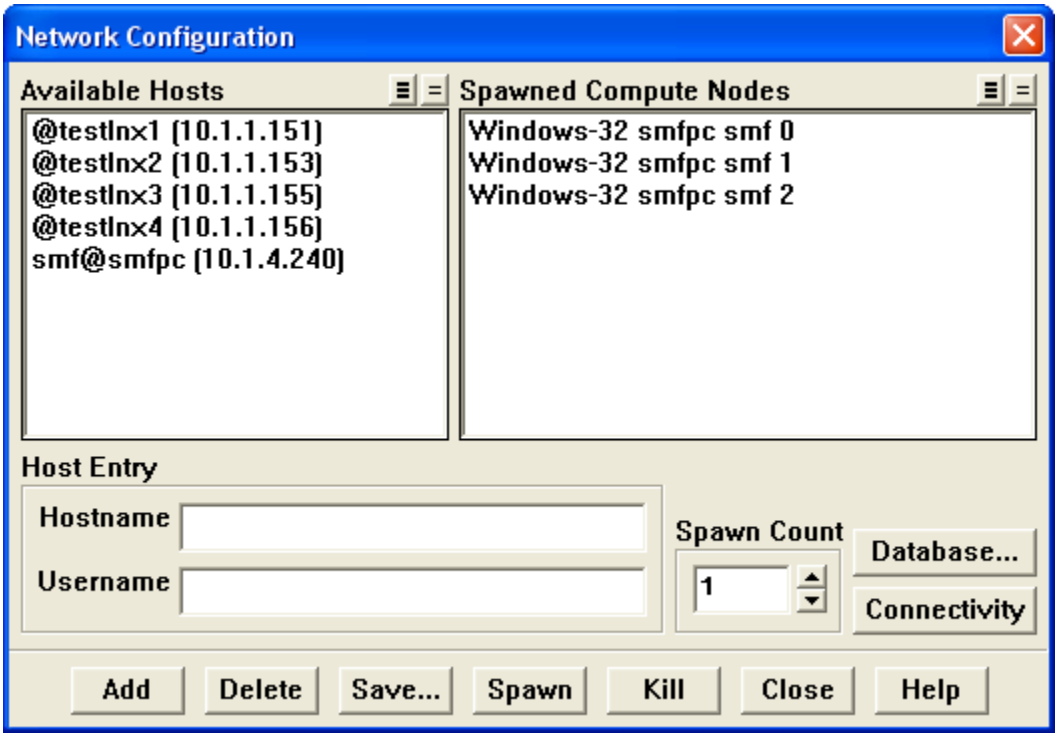
The ability to manually spawn additional compute nodes before reading the case file using the **Network Configuration** dialog box is only available when using the `net` option (e.g., `-mpi=net`). While this feature is still available in ANSYS FLUENT 6.3, its use is discouraged.

36.9.5.1. Network Configuration Dialog Box

Compute nodes are labeled sequentially starting at 0. In addition to the compute node processes, there is one host process. The host process is automatically started when ANSYS FLUENT starts, and it is killed when ANSYS FLUENT exits. It cannot be killed while running. Compute nodes, however, can be killed at any time, with the exception that compute node 0 can only be killed if it is the last remaining compute node process. The host process always spawns compute node 0. Compute node 0 spawns all other compute nodes.

If you want to spawn compute nodes on several different machines, or if you want to make any changes to the current network configuration (e.g., if you accidentally spawned too many compute nodes on the host machine when you started the solver), the *Network Configuration Dialog Box* (p. 2168) allows you to control the configuration of your parallel network.

Parallel → Network → **Configure...**



Controls

Available Hosts

contains a selectable list of hosts available for creating a parallel machine. If the hosts file `fluent.hosts` exists in your home directory, its contents are automatically added to the **Available Hosts** list at startup. Hosts can be added to the list either by specifying a hostname and optional username in the **Host Entry** box, or by copying selected hosts from the *Hosts Database Dialog Box* (p. 2166).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Spawned Compute Nodes
contains the list of all compute node processes that form the parallel machine. Each entry lists the operating system, hostname, username, and compute node ID, in that order. Compute nodes can be added to this list by selecting hosts from the **Available Hosts** list.

Host Entry
is used to manually add and delete hosts from the **Available Hosts** list.

Hostname
is the internet name of a remote machine.

Username
is your login name on the machine specified in the **Hostname** field. If all your accounts have the same login name, you do not need to specify a username.

Spawn Count
defines the number of compute node processes to spawn on each selected host in the **Available Hosts** list.

Database...
opens the *Hosts Database Dialog Box* (p. 2166).

Connectivity
displays the network connectivity of all compute nodes selected in the **Spawned Compute Nodes** list. If no compute nodes are selected, the *Parallel Connectivity Dialog Box* (p. 2171) is opened.

Add
adds a workstation from the **Host Entry** box to the **Available Hosts** list.

To add a host to the **Available Hosts** list manually, you can enter the internet name of the remote machine in the **Hostname** field under **Host Entry**, enter your login name on that machine in the **Username** field (unless your accounts all have the same login name, in which case you need not specify a username), and then click the **Add** button. The specified host will be added to the **Available Hosts** list.

Delete
removes the host specified in the **Host Entry** box or selected in the **Available Hosts** list from the **Available Hosts** list.

To delete a host from the **Available Hosts** list in the *Network Configuration Dialog Box* (p. 2168), select the host and click the **Delete** button. The host name will be removed from the **Available Hosts** list (but the *Hosts Database Dialog Box* (p. 2166) will not be affected).

Save...
opens *The **Select File** Dialog Box* (p. 33), which allows you to write a hosts file for future use that contains all entries in the **Available Hosts** list. In a future session, you can load the contents of this file into the *Hosts Database Dialog Box* (p. 2166) and then copy the hosts over to the *Network Configuration Dialog Box* (p. 2168) in order to reproduce the current **Available Hosts** list.

Spawn
creates compute node processes on all hosts selected in the **Available Hosts** list.

Kill
kills the compute node processes selected in the **Spawned Compute Nodes** list.

Important

Remember that compute node 0 can only be killed if it is the last remaining compute node process.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

The basic steps for spawning compute nodes are as follows:

1. Choose the host machine(s) on which to spawn compute nodes in the **Available Hosts** list. If the desired machine is not listed, you can use the **Host Entry** fields to manually add a host, or you can copy the desired host from the host database.
2. Set the number of compute node processes to spawn on each selected host machine in the **Spawn Count** field.
3. Click the **Spawn** button and the new node(s) will be spawned and added to the **Spawned Compute Nodes** list.

Common Problems Encountered During Node Spawning

The spawning process will try to establish a connection with a new compute node, but if after 50 seconds it receives no response from the new compute node, it will assume the spawn was unsuccessful. The spawn will be unsuccessful, for example, if the remote machine is unable to find the ANSYS FLUENT executable. To manually test if the spawning machine can start a new compute node, you can type

`rsh [-l`*username*`]` *hostname* `fluent -t0 -v`

from a shell prompt on the spawning machine. *hostname* should be replaced with the internet name of the machine on which you want to spawn a compute node, and *username* should be replaced with your login name on the remote machine specified by *hostname*.

Important

If all your accounts have the same login name, you do not need to specify a username. (The square brackets around `-l`*username* indicate that it is not always required; if you do enter a login name, do not include the square brackets.) Note that on some systems, the remote shell command is `remsh` instead of `rsh`.

The spawn test could fail for several reasons:

Login incorrect.
The machine spawning a new compute node must be able to `rsh` to the machine where the new process will reside, or the spawn will fail. There are several ways to enable this capability. Consult your systems administrator for assistance.

fluent: Command not found.
The `rsh` to the remote machine succeeded, but the path to the ANSYS FLUENT shell script could not be found on that machine. If you are using `csh`, then the path to the ANSYS FLUENT shell script should be added to the `path` variable in your `.cshrc` file. If that also fails, you can use the `parallel/network/path` text command to set the path to the `Fluent.Inc` installation directory directly before spawning the compute node.

`parallel` → `network` → `path`

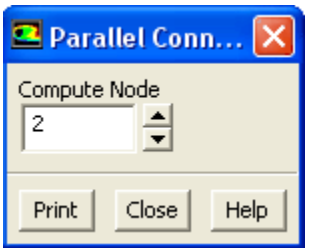
36.9.6. Parallel/Network/Show Connectivity...

The **Parallel/Network/Show Connectivity...** menu item opens the *Parallel Connectivity Dialog Box* (p. 2171).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.9.6.1. Parallel Connectivity Dialog Box

The **Parallel Connectivity** dialog box prints the connectivity of the selected compute node. See *Checking Network Connectivity* (p. 1625) for details.



Controls

Compute Node
indicates the compute node ID for which connectivity information is desired.

Print
prints information (in the console window) about the network connectivity for the selected compute node.

36.9.7. Parallel/Network/Show Latency

The **Parallel/Network/Show Latency** menu item prints information to the console about the communication speed for each node, as well as minimum and maximum latency between two nodes. See *Checking Latency and Bandwidth* (p. 1628) for details.

36.9.8. Parallel/Network/Show Bandwidth

The **Parallel/Network/Show Bandwidth** menu item prints information to the console about the amount of data communicated within one second between two nodes, as well as minimum and maximum bandwidth between two nodes. See *Checking Latency and Bandwidth* (p. 1628) for details.

36.9.9. Parallel/Timer/Usage

The **Parallel/Timer/Usage** menu item prints performance statistics in the console.

36.9.10. Parallel/Timer/Reset

The **Parallel/Timer/Reset** menu item clears the performance meter.

36.10. View Menu

For additional information, please see the following sections:

36.10.1. View/Toolbars
36.10.2. View/Navigation Pane
36.10.3. View/Task Page
36.10.4. View/Graphics Window
36.10.5. View/Embed Graphics Window
36.10.6. View/Show All
36.10.7. View/Show Only Console
36.10.8. View/Graphics Window Layout

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.10.9. View/Save Layout

36.10.1. View/Toolbars

The **View/Toolbars** menu item allows you to toggle the visibility of the toolbars in the application window.

36.10.2. View/Navigation Pane

The **View/Navigation Pane** menu item allows you to toggle the visibility of the navigation pane in the application window.

36.10.3. View/Task Page

The **View/Task Page** menu item allows you to toggle the visibility of the task pages in the application window.

36.10.4. View/Graphics Window

The **View/Graphics Window** menu item allows you to toggle the visibility of the graphics window in the application window. This option is only visible when the graphics window is embedded in the application.

36.10.5. View/Embed Graphics Window

The **View/Embed Graphics Window** menu item allows you to toggle between attaching and detaching the graphics window within the application.

36.10.6. View/Show All

The **View/Show All** menu item allows you to display the toolbars, the navigation pane, the task pages, and the graphics window, if one or more of them is currently not visible.

36.10.7. View/Show Only Console

The **View/Show Only Console** menu item allows you to display only the console window in the application.

36.10.8. View/Graphics Window Layout

The **View/Graphics Window Layout** menu item displays several layout options for use with multiple graphics windows. This option is only visible when the graphics window is embedded in the application.

36.10.9. View/Save Layout

The **View/Save Layout** menu item is used to save the current arrangement of dialog boxes and graphics windows. The positions of these items on your screen will be written to a `.cxlayout` file in your home folder.

36.11. Turbo Menu

For additional information, please see the following sections:

36.11.1. Turbo/Report...
36.11.2. Turbo/Averaged Contours...
36.11.3. Turbo/2D Contours...

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

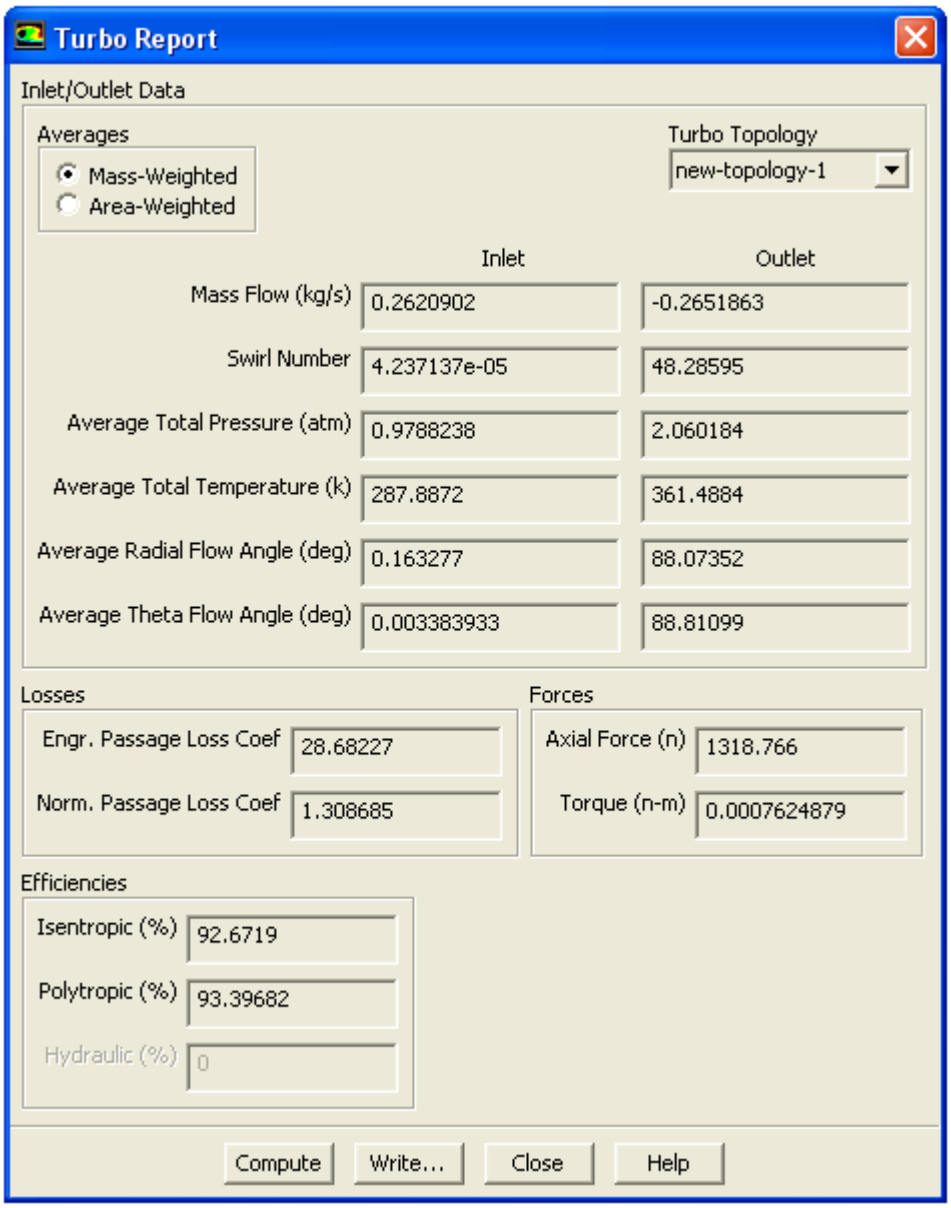
36.11.4. Turbo/Averaged XY Plot...
36.11.5. Turbo/Options...

36.11.1. Turbo/Report...

The **Turbo/Report...** menu item opens the *Turbo Report Dialog Box* (p. 2173).

36.11.1.1. Turbo Report Dialog Box

The **Turbo Report** dialog box allows you to calculate turbomachinery-specific quantities and integrals. See *Generating Reports of Turbomachinery Data* (p. 1487) for details.



Controls

Inlet/Outlet Data

contains quantities that can be calculated at inlets and outlets.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Averages
allows you to choose between **Mass-Weighted** and **Area-Weighted** averages for all applicable computed quantities. These quantities are calculated for the **Inlet** and **Outlet** topologies where applicable.

Turbo Topology
contains a list of defined topologies. Select from the list to display the values for the selected topology.

Mass Flow
is the mass flow rate through a surface as defined in *Equation 31–2* (p. 1488).

Swirl Number
is the swirl number as defined in *Equation 31–3* (p. 1488).

Average Total Pressure
is the area-averaged or mass-averaged total pressure as defined in *Equation 31–5* (p. 1489) or *Equation 31–6* (p. 1489).

Average Total Temperature
is the area-averaged or mass-averaged total temperature as defined in *Equation 31–7* (p. 1489) or *Equation 31–8* (p. 1489).

Average Radial Flow Angle
is the area-averaged or mass-averaged radial flow angle as defined in *Equation 31–9* (p. 1490) or *Equation 31–11* (p. 1490).

Average Theta Flow Angle
is the area-averaged or mass-averaged tangential flow angle as defined in *Equation 31–10* (p. 1490) or *Equation 31–12* (p. 1490).

Losses
contains the values of loss-related coefficients.

Engr. Passage Loss Coef
is the engineering loss coefficient as defined in *Equation 31–13* (p. 1490).

Norm. Passage Loss Coef
is the normalized loss coefficient as defined in *Equation 31–14* (p. 1491).

Forces
contains the axial force and the torque on the rotating parts.

Axial Force
is the axial force on the rotating parts as defined in *Equation 31–15* (p. 1491).

Torque
is the torque on the rotating parts as defined in *Equation 31–16* (p. 1491).

Efficiencies
contains the values of isentropic, polytropic and hydraulic efficiencies.

Isentropic
is the isentropic efficiency for a compressor or a turbine (motor) calculated in the presence of a compressible working fluid as defined in *Equation 31–21* (p. 1493) or *Equation 31–27* (p. 1495).

Polytropic
is the polytropic efficiency for a compressor or a turbine (motor) calculated in the presence of a compressible working fluid as defined in *Equation 31–22* (p. 1494) or *Equation 31–28* (p. 1496).

Hydraulic
is the hydraulic efficiency for a pump or a hydraulic turbine (motor) calculated in the presence of an incompressible working fluid as defined in *Equation 31–17* (p. 1492) or *Equation 31–23* (p. 1494).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Compute
starts the calculation of the quantities in all the fields in the **Turbo Report** dialog box. Note that this process may take some time for a large problem.

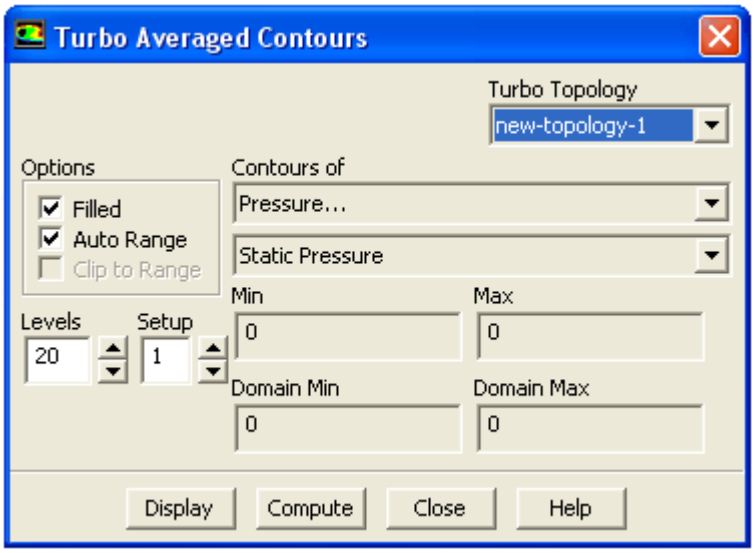
Write...
opens the **Select File** dialog box, which you can use to save the reported values to a file.

36.11.2. Turbo/Averaged Contours...

The **Turbo/Averaged Contours...** menu item opens the *Turbo Averaged Contours Dialog Box* (p. 2175).

36.11.2.1. Turbo Averaged Contours Dialog Box

The **Turbo Averaged Contours** dialog box allows you display turbomachinery-specific circumferentially averaged contours of variables projected on an r- z plane. See *Displaying Turbomachinery Averaged Contours* (p. 1496) for details.



Controls

Turbo Topology
contains a list of defined topologies. Select from the list to display the values for the selected topology.

Options
contains the check buttons that set various contour display options.

Filled
toggles between filled contours and line contours.

Auto Range
toggles between automatic and manual setting of the contour range. Any time you change the **Contours of** selection, **Auto Range** is reset to on.

Clip to Range
determines whether or not values outside the prescribed **Min**/ **Max** range are contoured when using **Filled** contours. If selected, values outside the range will not be contoured. If not selected, values below the **Min** value will be colored with the lowest color on the color scale, and values above the **Max** value will be colored with the highest color on the color scale. See *Specifying the Range of Magnitudes Displayed* (p. 1390) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Levels
sets the number of contour levels that are displayed.

Setup
indicates the ID number of the contour setup. For frequently used combinations of contour fields and options, you can store the information needed to generate the contour plot by specifying a **Setup** number and setting up the desired information in the dialog box. See *Storing Contour Plot Settings* (p. 1393) for details.

Contours of
contains a list from which you can select the scalar field to be contoured.

Min
shows the minimum value of the scalar field. If **Auto Range** is off, you can set the minimum by typing a new value.

Max
shows the maximum value of the scalar field. If **Auto Range** is off, you can set the maximum by typing a new value.

Domain Min
shows the global minimum value of the scalar field for the entire domain.

Domain Max
shows the global maximum value of the scalar field for the entire domain.

Display
draws the contours in the active graphics window.

Compute
calculates the scalar field and updates the **Min** and **Max** values (even when **Auto Range** is off).

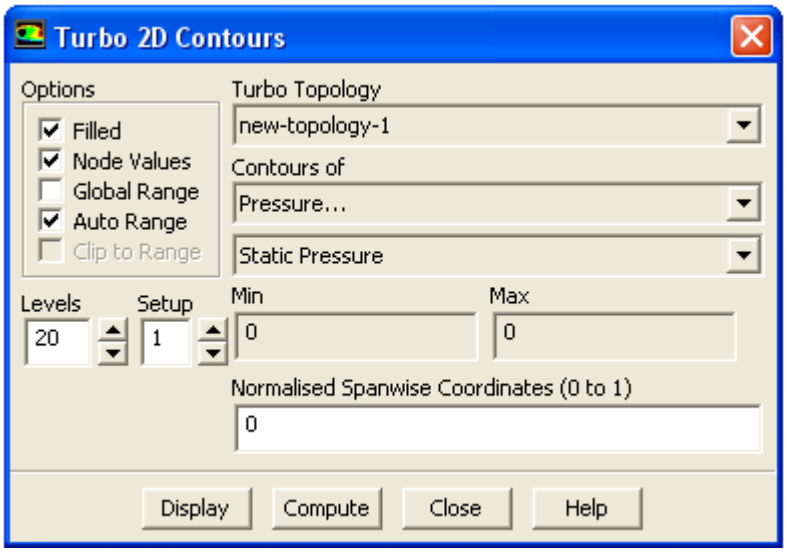
36.11.3. Turbo/2D Contours...

The **Turbo/2D Contours...** menu item opens the *Turbo 2D Contours Dialog Box* (p. 2176).

36.11.3.1. Turbo 2D Contours Dialog Box

The **Turbo 2D Contours** dialog box allows you display turbomachinery-specific contours of variables on surfaces of constant pitchwise, spanwise, or meridional coordinates, projected onto a plane. See *Displaying Turbomachinery 2D Contours* (p. 1497) for details.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.



Controls

Turbo Topology

contains a list of defined topologies. Select from the list to display the values for the selected topology.

Options

contains the check buttons that set various contour display options.

Filled

toggles between filled contours and line contours.

Node Values

toggles between using scalar field values at nodes and at cell centers for computing the contours.

Global Range

toggles between basing the minimum and maximum values on the range of values on the selected surfaces (off), and basing them on the range of values in the entire domain (on, the default).

Auto Range

toggles between automatic and manual setting of the contour range. Any time you change the **Contours of** selection, **Auto Range** is reset to on.

Clip to Range

determines whether or not values outside the prescribed **Min**/ **Max** range are contoured when using **Filled** contours. If selected, values outside the range will not be contoured. If not selected, values below the **Min** value will be colored with the lowest color on the color scale, and values above the **Max** value will be colored with the highest color on the color scale. See *Specifying the Range of Magnitudes Displayed* (p. 1390) for details.

Levels

sets the number of contour levels that are displayed.

Setup

indicates the ID number of the contour setup. For frequently used combinations of contour fields and options, you can store the information needed to generate the contour plot by specifying a **Setup** number and setting up the desired information in the dialog box. See *Storing Contour Plot Settings* (p. 1393) for details.

Contours of

contains a list from which you can select the scalar field to be contoured.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Min
shows the minimum value of the scalar field. If **Auto Range** is off, you can set the minimum by typing a new value.

Max
shows the maximum value of the scalar field. If **Auto Range** is off, you can set the maximum by typing a new value.

Normalised Spanwise Coordinates (0 to 1)
allows you to specify the coordinate for the spanwise surface you want to create.

Display
draws the contours in the active graphics window.

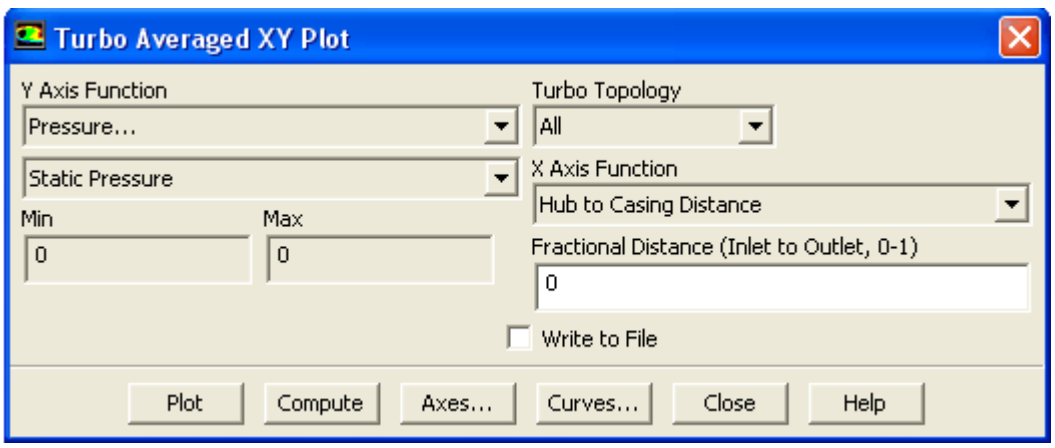
Compute
calculates the scalar field and updates the **Min** and **Max** values (even when **Auto Range** is off).

36.11.4. Turbo/Averaged XY Plot...

The **Turbo/Averaged XY Plot...** menu item opens the *Turbo Averaged XY Plot Dialog Box* (p. 2178).

36.11.4.1. Turbo Averaged XY Plot Dialog Box

The **Turbo Averaged XY Plot** dialog box allows you to display data in an XY plot format as a function of either the meridional or the spanwise coordinate. See *Generating Averaged XY Plots of Turbomachinery Solution Data* (p. 1499) for details.



Controls

Y Axis Function
contains a list of solution variables that can be used for the y axis of the plot.

Min
shows the minimum value of the scalar field.

Max
shows the maximum value of the scalar field.

Turbo Topology
contains a list of defined topologies. Select from the list to display the values for the selected topology.

X Axis Function
allows you to select the coordinate to be used for the x axis of the plot. The choices are **Hub to Casing Distance** (spanwise coordinate), and **Meridional Distance** (meridional coordinate).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Fractional Distance
sets a fractional value (0 to 1) for either the spanwise **Hub to Casing** distance or the meridional **Inlet to Outlet** distance, depending on your selection for **X Axis Function**.

Write to File
activates the file-writing option. When this option is selected, the **Plot** push button will change to **Write...**. Clicking on the **Write...**button will open the *The **Select File** Dialog Box* (p. 33), in which you can specify a name and save a file containing the plot data. The format of this file is described in *XY Plot File Format* (p. 1477).

Plot
plots the specified surface and/or file data in the active graphics window using the current axis and curve attributes. If the **Write to File** option is turned on, this button becomes the **Write...** button.

Write...
opens the *The **Select File** Dialog Box* (p. 33), in which you can save the plot data to a file. This button replaces the **Plot** button when the **Write to File** option is turned on.

Compute
calculates the scalar field and updates the **Min** and **Max** values.

Axes...
opens the *Axes Dialog Box* (p. 2022), which allows you to customize the plot axes.

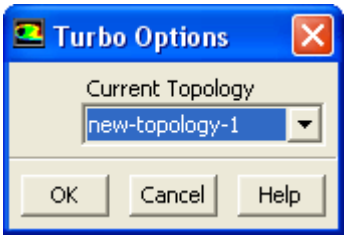
Curves...
opens the *Curves Dialog Box* (p. 2024), which allows you to customize the curves used in the XY plot.

36.11.5. Turbo/Options...

The **Turbo/Options...** menu item opens the *Turbo Options Dialog Box* (p. 2179).

36.11.5.1. Turbo Options Dialog Box

The **Turbo Options** dialog box allows you to globally set the turbomachinery topology for your model. See *Globally Setting the Turbomachinery Topology* (p. 1500) for details.



Controls

Current Topology
contains a list of predefined turbo topologies.

36.12. Help Menu

For additional information, please see the following sections:

36.12.1. Help/User's Guide Contents...
36.12.2. Help/User's Guide Index...
36.12.3. Help/PDF...
36.12.4. Help/Context-Sensitive Help
36.12.5. Help/Using Help...

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

36.12.6. Help/Online Technical Resources...
36.12.7. Help/License Usage
36.12.8. Help/Version...

36.12.1. Help/User's Guide Contents...

The **Help/User's Guide Contents...** menu item opens the help viewer to the contents page of the User's Guide. See *Using the GUI Help System* (p. 41) for details.

36.12.2. Help/User's Guide Index...

The **Help/User's Guide Index...** menu item opens the help viewer to the index page of the User's Guide. See *Using the GUI Help System* (p. 41) for details.

36.12.3. Help/PDF...

The **Help/PDF...** menu item displays a submenu that allows you access to the User's Guide and other manuals in printable format (PDF).

36.12.4. Help/Context-Sensitive Help

The **Help/Context-Sensitive Help** menu item allows you to get help for a specific topic represented by a pull-down menu item, a dialog box, or another part of the graphical user interface. When you select **Context-Sensitive Help**, the screen cursor will change to the shape of a question mark. Now you can select an item from a pull-down menu or click on another component of the graphical user interface. The web browser will open directly to the corresponding section of the User's Guide.

Important

Context-sensitive help is not available on Windows systems.

36.12.5. Help/Using Help...

The **Help/Using Help...** menu item opens the help viewer directly to the section on using the on-line help facility. See *Using the GUI Help System* (p. 41) for details.

36.12.6. Help/Online Technical Resources...

The **Help/Online Technical Resources...** menu item opens the web browser to the ANSYS Customer Portal web site where you can search for solutions and log requests. See *Using the GUI Help System* (p. 41) for details.

36.12.7. Help/License Usage

The **Help/License Usage...** menu item provide ANSYS FLUENT license information. See *Using the GUI Help System* (p. 41) for details.

36.12.8. Help/Version...

The **Help/Version...** menu item shows you the version and release of ANSYS FLUENT that you are using.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Beta Features

ANSYS FLUENT contains Beta features that should be used under the supervision of an ANSYS support representative. Information about Beta features can be found on the ANSYS Customer Portal and the ANSYS FLUENT User Services Center.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information
of ANSYS, Inc. and its subsidiaries and affiliates.

Appendix A. ANSYS FLUENT Model Compatibility

The following tables summarize the compatibility of several ANSYS FLUENT model categories:

- Multiphase Models (see *Modeling Multiphase Flows* (p. 1091))
- Moving Domain Models (See *Modeling Flows with Moving Reference Frames* (p. 513))
- Turbulence Models (See *Modeling Turbulence* (p. 643))
- Combustion Models (See Chapters *Modeling Species Transport and Finite-Rate Chemistry* (p. 799) – *Modeling Engine Ignition* (p. 929))

Note that a y indicates that two models are compatible with each other, while an n indicates that two models are not compatible with each other.

Table A.1 Multiphase Models vs. Moving Domain Models

	Sliding Mesh	Mixing Plane	Dynamic Mesh	Multiple Reference Frame	Single Reference Frame
Eulerian	y	y	y	y	y
VOF	y	y	y	y	y
Mixture	y	y	y	y	y
Discrete Phase	y	n	y	y	y

Table A.2 Multiphase Models vs. Turbulence Models

	Spalart–Allmaras	k–epsilon	k–omega	Reynolds Stress	LES
Eulerian	n	y	y	y	n

Appendix B. Case and Data File Formats

This Appendix describes the contents and formats of ANSYS FLUENT case and data files.

- *Guidelines* (p. 2187)
- *Formatting Conventions in Binary and Formatted Files* (p. 2187)
- *Grid Sections* (p. 2188)
- *Other (Non-Grid) Case Sections* (p. 2199)
- *Data Sections* (p. 2201)

Descriptions of the sections are grouped according to function.

- *Formatting Conventions in Binary and Formatted Files* (p. 2187) : The differences between formatted and binary files.
- *Grid Sections* (p. 2188) : Creating grids for ANSYS FLUENT.
- *Other (Non-Grid) Case Sections* (p. 2199)
- *Grid Sections* (p. 2188) *Data Sections* (p. 2201) : Importing solutions into another postprocessor.

The case and data files may contain other sections that are intended for internal use only.

B.1. Guidelines

The ANSYS FLUENT case and data files are broken into several sections according to the following guidelines:

- Each section is enclosed in parentheses and begins with a decimal integer indicating its type. This integer is different for formatted and binary files (*Formatting Conventions in Binary and Formatted Files* (p. 2187)).
- All groups of items are enclosed in parentheses. This makes skipping to ends of (sub)sections and parsing them very easy. It also allows for easy and compatible addition of new items in future releases.
- Header information for lists of items is enclosed in separate sets of parentheses preceding the items, and the items are enclosed in their own parentheses.

B.2. Formatting Conventions in Binary and Formatted Files

For formatted files, examples of file sections are given in *Grid Sections* (p. 2188) and *Other (Non-Grid) Case Sections* (p. 2199). For binary files, the header indices described in this section (e.g., `10` for the node section) are preceded by `20` for single-precision binary data, or by `30` for double-precision binary data (e.g., `2010` or `3010` instead of `10`). The end of the binary data is indicated by `End of Binary Section 2010` or `End of Binary Section 3010` before the closing parameters of the section.

An example with the binary data represented by periods is as follows:

```
(2010 (2 1 2aad 2 3)(
 .
 .
 .
```

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
)
End of Binary Section 2010)
```

B.3. Grid Sections

Grid sections are stored in the case file. A grid file is a subset of a case file, containing only those sections pertaining to the grid. The currently defined grid sections are:

- Comment (See *Comment* (p. 2188))
- Header (See *Header* (p. 2188))
- Dimensions (See *Dimensions* (p. 2189))
- Nodes (See *Nodes* (p. 2189))
- Periodic Shadow Faces (See *Periodic Shadow Faces* (p. 2190))
- Cells (See *Cells* (p. 2191))
- Faces (See *Faces* (p. 2192))
- Face Tree (See *Face Tree* (p. 2194))
- Cell Tree (See *Cell Tree* (p. 2194))
- Interface Face Parents (See *Interface Face Parents* (p. 2195))

The section ID numbers are indicated in both symbolic and numeric forms. The symbolic representations are available as symbols in a Scheme source file (`xfile.scm`), which is available from ANSYS Inc., or as macros in a C header file (`xfile.h`), which is located in your installation area.

B.3.1. Comment

Index:	0
Scheme symbol:	`xf-comment`
C macro:	`XF_COMMENT`
Status:	optional

Comment sections can appear anywhere in the file (except within other sections) as:

```
(0 "comment text")
```

It is recommended to precede each long section, or group of related sections, by a comment section explaining what is to follow.

Example:

```
(0 "Variables:")
 (37 (
 (relax-mass-flow 1)
 (default-coefficient ())
 (default-method 0)
 ))
```

B.3.2. Header

Index:	1
Scheme symbol:	`xf-header`
C macro:	`XF_HEADER`

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

Status: optional

Header sections can appear anywhere in the file (except within other sections). The following is an example:

```
(1 "TGrid 2.1.1")
```

The purpose of this section is to identify the program that wrote the file. Although it can appear anywhere, it is one of the first sections in the file. Additional header sections indicate other programs that may have been used in generating the file. It provides a history mechanism showing where the file came from and how it was processed.

B.3.3. Dimensions

Index: 2
Scheme symbol: `xf-dimension`
C macro: `XF_DIMENSION`
Status: optional

The dimensions of the grid appear as:

```
(2 ND)
```

where ND is 2 or 3. This section is supported as a check that the grid has the appropriate dimension.

B.3.4. Nodes

Index: 10
Scheme symbol: `xf-node`
C macro: `XF_NODE`
Status: required

Format:

```
(10 (zone-id first-index last-index type ND)(
 x1 y1 z1
 x2 y2 z2
 .
 .
 .
 ))
```

- If `zone-id` is zero, this provides the total number of nodes in the grid. `first-index` will then be one, `last-index` will be the total number of nodes *in hexadecimal*, `type` is equal to `1`, NDis the dimensionality of the grid, and there are no coordinates following (the parentheses for the coordinates are omitted as well).

  For example: `(10 (0 1 2d5 1 2))`

- If `zone-id` is greater than zero, it indicates the zone to which the nodes belong. `first-index` and `last-index` are the indices of the nodes in the zone, *in hexadecimal*. The values of `last-index` in each zone must be less than or equal to the value in the declaration section. **Type** is always equal to `1`.

  NDis an optional argument that indicates the dimensionality of the node data, where ND is 2 or 3.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

If the number of dimensions in the grid is two, as specified by the node header, then only x and y coordinates are present on each line.

The following is an example of a 2D grid:

```
(10 (1 1 2d5 1 2)(
 1.500000e-01 2.500000e-02
 1.625000e-01 1.250000e-02
   .
   .
   .
 1.750000e-01 0.000000e+00
 2.000000e-01 2.500000e-02
 1.875000e-01 1.250000e-02
 ))
```

Because the grid connectivity is composed of integers representing pointers (see Cells and Faces), using hexadecimal conserves space in the file and provides for faster file input and output. The header indices are in hexadecimal so that they match the indices in the bodies of the grid connectivity sections. The `zone-id` and `type` are also in hexadecimal for consistency.

B.3.5. Periodic Shadow Faces

Index:	18
Scheme symbol:	`xf-periodic-face`
C macro:	`XF_PERIODIC_FACE`
Status:	required only for grids with periodic boundaries

This section indicates the pairings of periodic faces on periodic boundaries. Grids without periodic boundaries do not have sections of this type. The format of the section is as follows:

```
(18 (first-index last-index periodic-zone shadow-zone)(
 f00 f01
 f10 f11
 f20 f21
 .
 .
 .
 ))
```

where

`first-index` = index of the first periodic face pair in the list

`last-index` = index of the last periodic face pair in the list

`periodic-zone` = zone ID of the periodic face zone

`shadow-zone` = zone ID of the corresponding shadow face zone

These are in hexadecimal format. The indices in the section body (`f*`) refer to the faces on each of the periodic boundaries (in hexadecimal), the indices being offsets into the list of faces for the grid.

Note

In this case, `first-index` and `last-index` do *not* refer to face indices. They refer to indices in the list of periodic pairs.

Example:

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
(18 (1 2b a c) (
 12 1f
 13 21
 ad 1c2
 .
 .
 .
 ))
```

B.3.6. Cells

Index:	12
Scheme symbol:	`xf-cell`
C macro:	XF_CELL
Status:	required

The declaration section for cells is similar to that for nodes.

```
(12 (zone-id first-index last-index type element-type))
```

Again, `zone-id` is zero to indicate that it is a declaration of the total number of cells. If `last-index` is zero, then there are no cells in the grid. This is useful when the file contains only a surface mesh to alert ANSYS FLUENT that it cannot be used. In a declaration section, the `type` has a value of zero and the `element-type` is not present.

For example,

```
(12 (0 1 3e3 0))
```

It states that there are 3e3 (hexadecimal) = 995 cells in the grid. This declaration section is required and must precede the regular cell sections.

The `element-type` in a regular cell section header indicates the type of cells in the section, as follows:

`element-type`	*description*	*nodes/cell*	*faces/cell*
0	mixed		
1	triangular	3	3
2	tetrahedral	4	4
3	quadrilateral	4	4
4	hexahedral	8	6
5	pyramid	5	5
6	wedge	6	5
7	polyhedral	NN	NF

where NN and NF will vary, depending on the specific polyhedral cell.

Regular cell sections have no body, but they have a header of the same format where `first-index` and `last-index` indicate the range for the particular zone, `type` indicates whether the cell zone is an active zone (solid or fluid), or inactive zone (currently only parent cells resulting from hanging node adaption). Active zones are represented with `type`=1, while inactive zones are represented with `type`=32.

In the earlier versions of ANSYS FLUENT, a distinction was made used between solid and fluid zones. This is now determined by properties (i.e., material type).

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

A `type` of zero indicates a dead zone and will be skipped by ANSYS FLUENT. If a zone is of mixed type (`element-type`=0), it will have a body that lists the `element-type` of each cell.

Example:

```
(12 (9 1 3d 0 0)(
 1 1 1 3 3 1 1 3 1
 .
 .
 .
 ))
```

Here, there are 3d (hexadecimal) = 61 cells in cell zone 9, of which the first 3 are triangles, the next 2 are quadrilaterals, and so on.

B.3.7. Faces

Index:	13
Scheme symbol:	`xf-face`
C macro:	XF_FACE
Status:	required

The format for face sections is as follows:

```
(13 (zone-id first-index last-index bc-type face-type))
```

where

`zone-id` = zone ID of the face section

`first-index` = index of the first face in the list

`last-index` = index of the last face in the list

`bc-type` = ID of the boundary condition represented by the face section

`face-type` = ID of the type(s) of face(s) in the section

The current valid boundary condition types are defined in the following table:

`bc-type`	*description*
2	interior
3	wall
4	pressure-inlet, inlet-vent, intake-fan
5	pressure-outlet, exhaust-fan, outlet-vent
7	symmetry
8	periodic-shadow
9	pressure-far-field
10	velocity-inlet
12	periodic
14	fan, porous-jump, radiator
20	mass-flow-inlet

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

24	interface
31	parent (hanging node)
36	outflow
37	axis

The faces resulting from the intersection of non-conformal grids are placed in a separate face zone, where a factor of 1000 is added to the `bc-type` (e.g., 1003 is a wall zone).

The current valid face types are defined in the following table:

`face-type`	*description*	*nodes/face*
0	mixed	
2	linear	2
3	triangular	3
4	quadrilateral	4
5	polygonal	NN

where NN will vary, depending on the specific polygonal face.

A `zone-id` of zero indicates a declaration section, which provides a count of the total number of faces in the file. Such a section omits the `bc-type` and is not followed by a body with further information.

A non-zero `zone-id` indicates a regular face section, and will be followed by a body that contains information about the grid connectivity. Each line of the body will describe one face and will have the following format:

```
n0 n1 n2 c0 c1
```

where,

`n*` = defining nodes (vertices) of the face

`c*` = adjacent cells

This is the format for a 3D grid with a triangular face format. The actual number of nodes depends on the `face-type`. The order of the cell indices is important, and is determined by the right-hand rule: if you curl the fingers of your right hand in the order of the nodes, your thumb will point toward `c0`.

For 2D grids, `n2` is omitted. `c1` is determined by the cross product of two vectors, $\hat{r}$ and $\hat{k}$. The $\hat{r}$ vector extends from `n0` to `n1`, whereas the $\hat{k}$ vector has its origin at `n0` and points out of the grid plane toward the viewer. If you extend your right hand along $\hat{r}$ and curl your fingers in the direction of the angle between $\hat{r}$ and $\hat{k}$, your thumb will point along $\hat{r}\times\hat{k}$ toward `c1`.

If the face zone is of mixed type (`face-type`= 0), each line of the section body will begin with a reference to the number of nodes that make up that particular face, and has the following format:

```
x n0 n1 ... nf c0 c1
```

where,

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

`x` = the number of nodes (vertices) of the face

`nf` = the final node of the face

All cells, faces, and nodes have positive indices. If a face has a cell only on one side, then either `c0` or `c1` is zero. For files containing only a surface mesh, both these values are zero.

For information on face-node connectivity for various cell types in ANSYS FLUENT, refer to *Face-Node Connectivity in ANSYS FLUENT* (p. 136).

B.3.8. Face Tree

Index:	59
Scheme symbol:	`xf-face-tree`
C macro:	XF_FACE_TREE
Status:	only for grids with hanging-node adaption

This section indicates the face hierarchy of the grid containing hanging nodes. The format of the section is as follows:

```
  (59 (face-id0 face-id1 parent-zone-id child-zone-id)
  (
  number-of-kids kid-id-0 kid-id-1 ... kid-id-n
 .
 .
 .
  ))
```

where,

`face-id0` = index of the first parent face in the section

`face-id1` = index of the last parent face in the section

`parent-zone-id` = ID of the zone containing parent faces

`child-zone-id` = ID of the zone containing children faces

`number-of-kids` = the number of children of the parent face

`kid-id-n` = the face IDs of the children

These are in hexadecimal format.

B.3.9. Cell Tree

Index:	58
Scheme symbol:	`xf-cell-tree`
C macro:	XF_CELL_TREE
Status:	only for grids with hanging-node adaption

This section indicates the cell hierarchy of the grid containing hanging nodes. The format of the section is as follows:

```
  (58 (cell-id0 cell-id1 parent-zone-id child-zone-id)
  (
  number-of-kids kid-id-0 kid-id-1 ... kid-id-n
 .
```

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
.
.
 ))
```

where,

`cell-id0` = index of the first parent cell in the section

`cell-id1` = index of the last parent cell in the section

`parent-zone-id` = ID of the zone containing parent cells

`child-zone-id` = ID of the zone containing children cells

`number-of-kids` = the number of children of the parent cell

`kid-id-n` = the cell IDs of the children

These are in hexadecimal format.

B.3.10. Interface Face Parents

Index:	61
Scheme symbol:	`xf-face-parents`
C macro:	XF_FACE_PARENTS
Status:	only for grids with non-conformal interfaces

This section indicates the relationship between the intersection faces and original faces. The intersection faces (children) are produced from intersecting two non-conformal surfaces (parents) and are some fraction of the original face. Each child will refer to at least one parent. The format of the section is as follows:

```
 (61 (face-id0 face-id1)
 (
 parent-id-0 parent-id-1
.
.
.
 ))
```

where,

`face-id0` = index of the first child face in the section

`face-id1` = index of the last child face in the section

`parent-id-*` = index of parent faces

These are in hexadecimal format.

If you read a non-conformal grid from ANSYS FLUENT into TGrid, TGrid will skip this section, so it will not maintain all the information necessary to preserve the non-conformal interface. When you read the grid back into ANSYS FLUENT, you will need to recreate the interface.

B.3.10.1. Example Files

B.3.10.1.1. Example 1

Figure B.1 (p. 2196) illustrates a simple quadrilateral mesh with no periodic boundaries or hanging nodes.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```

B.4. Other (Non-Grid) Case Sections

The following sections store boundary conditions, material properties, and solver control settings.

B.4.1. Zone
B.4.2. Partitions

B.4.1. Zone

Index:	39 or 45
Scheme symbol:	`xf-rp-tv`
C macro:	XF_RP_TV
Status:	required

There is typically one zone section for each zone referenced by the grid. Although some grid zones may not have corresponding zone sections, there cannot be more than one zone section for each zone.

A zone section has the following form:

```
(39 (zone-id zone-type zone-name domain-id)(
(condition1 . value1)
(condition2 . value2)
(condition3 . value3)
.
.
.
 ))
```

Grid generators and other preprocessors need only provide the section header and leave the list of conditions empty, as in

```
(39 (zone-id zone-type zone-name domain-id)())
```

The empty parentheses at the end are required. The solver adds conditions as appropriate, depending on the zone type. When only `zone-id`, `zone-type`, `zone-name`, and `domain-id` are specified, the index 45 is preferred for a zone section. However, the index 39 must be used if boundary conditions are present, because any and all remaining information in a section of index 45 after `zone-id`, `zone-type`, `zone-name`, and `domain-id` will be ignored.

Here the `zone-id` is in *decimal* format. This is in contrast to the use of hexadecimal in the grid sections.

The `zone-type` is one of the following:

```
axis
 exhaust fan
 fan
 fluid
 inlet vent
 intake fan
 interface
 interior
 mass-flow-inlet
 outlet vent
 outflow
 periodic
 porous-jump
 pressure-far-field
 pressure-inlet
```

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
pressure-outlet
radiator
shadow
solid
symmetry
velocity-inlet
wall
```

The `interior`, `fan`, `porous-jump`, and `radiator` types can be assigned only to zones of faces inside the domain. The `interior` type is used for the faces within a cell zone; the others are for interior faces that form infinitely thin surfaces within the domain. ANSYS FLUENT allows the `wall` type to be assigned to face zones both on the inside and on the boundaries of the domain. Some zone types are valid only for certain types of grid components. For example, cell (element) zones can be assigned only one of the following types:

```
fluid
 solid
```

All of the other types listed above can be used only for boundary (face) zones.

The `zone-name` is a user-specified label for the zone. It must be a valid Scheme symbol [1] and is written without quotes. The rules for a valid `zone-name` (Scheme symbol) are as follows:

- The first character must be a lowercase letter [2] or a special-initial.
- Each subsequent character must be a lowercase letter, a special-initial, a digit, or a special-subsequent.

where a special-initial character is one of the following:

```
! $ % & * / : < = > ? ~ _ ^
```

and a special-subsequent is one of the following:

```
. + -
```

Examples of valid zone names are `inlet-port/cold!–`, `eggs/easy`, and `e=m*c^2`.

Some examples of zone sections produced by grid generators and preprocessors are as follows:

```
(39 (1 fluid fuel 1)())
 (39 (8 pressure-inlet pressure-inlet-8 2)())
 (39 (2 wall wing-skin 3)())
 (39 (3 symmetry mid-plane 1)())
```

The `domain-id` is an integer that appears after the zone name, associating the boundary condition with a particular phase or mixture (sometimes referred to as phase-domains and mixture-domains).

B.4.2. Partitions

Index:	40
Scheme symbol:	`xf-partition`
C macro:	`XF_PARTITION`
Status:	only for partitioned grids

[1] See Revised (4) Report on the Algorithmic Language Scheme, William Clinger and Jonathan Rees (Editors), 2 November 1991, Section 7.1.1.

[2] The Standard actually only requires that case be insignificant; the ANSYS FLUENT implementation accomplishes this by converting all uppercase input to lowercase.

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

This section indicates each cell's partition. The format of the section is as follows:

```
(40 (zone-id first-index last-index partition-count)(
p1
p2
p3
.
.
.
pn
))
```

where,

`p1` = the partition of the cell whose ID is `first-index`

`p2` = the partition of the cell whose ID is `first-index` + 1, etc.

`pn` = the partition of the cell whose ID is `last-index`

`partition-count` = the total number of partitions

Partition IDs must be between 0 and one less than `partition-count`.

B.5. Data Sections

The following sections store iterations, residuals, and data field values.

B.5.1. Grid Size
B.5.2. Data Field
B.5.3. Residuals

B.5.1. Grid Size

Index:	33
Scheme symbol:	`xf-grid-size`
C macro:	`XF_GRID_SIZE`
Status:	optional

This section indicates the number of cells, faces, and nodes in the grid that corresponds to the data in the file. This information is used to check that the data and grid match. The format is

```
(33 (n-elements n-faces n-nodes))
```

where the integers are written in decimal.

B.5.2. Data Field

Index:	300
Scheme symbol:	`xf-rf-seg-data`
C macro:	`XF_RF_SEG_DATA`
Status:	required

This section lists a flow field solution variable for a cell or face zone. The data are stored in the same order as the cells or faces in the case file. Separate sections are written out for each variable for each face or cell zone on which the variable is stored. The format is

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

```
(300 (sub-section-id zone-id size n-time-levels
 n-phases first-id last-id)
 ( data for cell or face with id = first-id
 data-for-cell-or-face with id = first-id+1
 ..
 data-for-cell-or-face with id = last-id
 ))
```

where `sub-section-id` is a (decimal) integer that identifies the variable field (e.g., 1 for pressure, 2 for velocity). The complete list of these is available in the header file (`xfile.h`), which is located in your installation area.

where,

`zone-id` = the ID number of the cell or face zone

`size` = the length of the variable vector

`zone-id` matches the ID used in case file. `size` is 1 for a scalar, 2 or 3 for a vector, equal to the number of species for variables defined for each species). `n-time-levels` currently are not used.

A sample data file section for the velocity field in a cell zone for a steady-state, single-phase, 2D problem is shown below:

```
(300 (2 16 2 0 0 17 100)
(8.08462024e-01 8.11823010e-02
 8.78750622e-01 3.15509699e-02
 1.06139672e+00 -3.74040119e-02
...
 1.33301604e+00 -5.04243895e-02
 6.21703446e-01 -2.46118382e-02
 4.41687912e-01 -1.27046436e-01
 1.03528820e-01 -1.01711005e-01
 ))
```

The variables that are listed in the data file depend on the models active at the time the file is written. Variables that are required by the solver based on the current model settings but are missing from the data file are set to their default values when the data file is read. Any extra variables that are present in the data file but are not relevant according to current model settings are ignored.

B.5.3. Residuals

Index:	302
Scheme symbol:	`xf-rf-scaled-residuals`
C macro:	`XF_RF_SCALED_RESIDUALS`
Status:	optional

This section lists the values of the residuals for a particular data field variable at each iteration:

```
(302 (n residual-section-id size domain-id)
(
iteration_number unscaled_residual scaling_factor
 .
 .
 .
 ))
```

where,

`n` = the number of residuals

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

`size` = the length of the variable vector

`residual-section-id` = an integer (decimal) indicating the equation

`domain-id` = domain ID

`size` is 1 for a scalar, 2 or 3 for a vector, equal to the number of species for variables defined for each species. The `residual-section-id` indicates the equation for which the residual is stored in the section, according to the C constants defined in a header file (`xfile.h`) available in your installation area, as noted in *Grid Sections* (p. 2188).

The equations for which residuals are listed in the data file depend on the models active at the time the file is written. If the residual history is missing from the data file for a currently active equation, it is initialized with zeros.

Appendix C. Nomenclature

A	Area (m ^{2}, ft ^{2})
$\vec{a}$	Acceleration (m/s ^{2}, ft/s ^{2})
a	Local speed of sound (m/s, ft/s)
c	Concentration (mass/volume, moles/volume)
C_D	Drag coefficient, defined different ways (dimensionless)
c_p, c_v	Heat capacity at constant pressure, volume (J/kg-K, Btu/lb $_m$- $^\circ$F)
d	Diameter; d_p, D_p, particle diameter (m, ft)
D_H	Hydraulic diameter (m, ft)
$_{ij}, D$	Mass diffusion coefficient (m ^{2}/s, ft ^{2}/s)
E	Total energy, activation energy (J, kJ, cal, Btu)
f	Mixture fraction (dimensionless)
$\vec{F}$	Force vector (N, lb $_f$)
F_D	Drag force (N, lb $_f$)
$\vec{g}$	Gravitational acceleration (m/s ^{2}, ft/s ^{2}); standard values = 9.80665 m/s ^{2}, 32.1740 ft/s ^{2}
Gr	Grashof number ≡ ratio of buoyancy forces to viscous forces (dimensionless)
H	Total enthalpy (energy/mass, energy/mole)
h	Heat transfer coefficient (W/m ^{2}-K, Btu/ft ^{2}-h- $^\circ$F)
h	Species enthalpy; h^0, standard state enthalpy of formation (energy/mass, energy/mole)
I	Radiation intensity (energy per area of emitting surface per unit solid angle)
J	Mass flux; diffusion flux (kg/m ^{2}-s, lb $_m$/ft ^{2}-s)
K	Equilibrium constant = forward rate constant/backward rate constant (units vary)
k	Kinetic energy per unit mass (J/kg, Btu/lb $_m$)
k	Reaction rate constant, e.g., $k_1, k_{-1}, k_{f,r}, k_{b,r}$ (units vary)
k	Thermal conductivity (W/m-K, Btu/ft-h- $^\circ$F)
k_B	Boltzmann constant (1.38×10^{-23} J/molecule-K)
k, k_c	Mass transfer coefficient (units vary); also K, K_c
ℓ, l, L	Length scale (m, cm, ft, in)
Le	Lewis number ≡ ratio of thermal diffusivity to mass diffusivity (dimensionless)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

m	Mass (g, kg, lb $_m$)
$\dot{m}$	Mass flow rate (kg/s, lb $_m$/s)
M_w	Molecular weight (kg/kmol, lb $_m$/lb $_m$mol)
M	Mach number ≡ ratio of fluid velocity magnitude to local speed of sound (dimensionless)
Nu	Nusselt number ≡ dimensionless heat transfer or mass transfer coefficient (dimensionless); usually a function of other dimensionless groups
p	Pressure (Pa, atm, mm Hg, lb $_f$/ft ^{2})
Pe	Peclet number $\equiv Re \times Pr$ for heat transfer, and $\equiv Re \times Sc$ for mass transfer (dimensionless)
Pr	Prandtl number ≡ ratio of momentum diffusivity to thermal diffusivity (dimensionless)
Q	Flow rate of enthalpy (W, Btu/h)
q	Heat flux (W/m ^{2}, Btu/ft ^{2}-h)
R	Gas-law constant (8.31447 $\times 10^3$ J/kmol-K, 1.98588 Btu/lb $_m$mol- $^\circ$F)
r	Radius (m, ft)
$\mathcal{R}$	Reaction rate (units vary)
Ra	Rayleigh number $\equiv Gr \times Pr$; measure of the strength of buoyancy-induced flow in natural (free) convection (dimensionless)
Re	Reynolds number ≡ ratio of inertial forces to viscous forces (dimensionless)
S	Total entropy (J/K, J/kmol-K, Btu/lb $_m$mol- $^\circ$F)
s	Species entropy; s^0, standard state entropy (J/kmol-K, Btu/lb $_m$mol- $^\circ$F)
Sc	Schmidt number ≡ ratio of momentum diffusivity to mass diffusivity (dimensionless)
S_{ij}	Mean rate-of-strain tensor (s $^{-1}$)
T	Temperature (K, $^\circ$C, $^\circ$R, $^\circ$F)
t	Time (s)
U	Free-stream velocity (m/s, ft/s)
u, v, w	Velocity magnitude (m/s, ft/s); also written with directional subscripts (e.g., v_x, v_y, v_z, v_r)
V	Volume (m ^{3}, ft ^{3})
$\vec{v}$	Overall velocity vector (m/s, ft/s)
We	Weber number ≡ ratio of aerodynamic forces to surface tension forces (dimensionless)
X	Mole fraction (dimensionless)
Y	Mass fraction (dimensionless)
α	Permeability, or flux per unit pressure difference (L/m ^{2}-h-atm, ft ^{3}/ft ^{2}-h-(lb $_f$/ft ^{2}))
α	Thermal diffusivity (m ^{2}/s, ft ^{2}/s)
α	Volume fraction (dimensionless)
β	Coefficient of thermal expansion (K $^{-1}$)

Release 13.0 - © SAS IP, Inc. All rights reserved. - Contains proprietary and confidential information of ANSYS, Inc. and its subsidiaries and affiliates.

γ	Porosity (dimensionless)
γ	Ratio of specific heats, c_p/c_v (dimensionless)
Δ	Change in variable, final − initial (e.g., Δp, Δt, ΔH, ΔS, ΔT)
δ	Delta function (units vary)
ε	Emissivity (dimensionless)
ε	Lennard-Jones energy parameter (J/molecule)
ε	Turbulent dissipation rate (m^2/s^3, ft^2/s^3)
ε	Void fraction (dimensionless)
η	Effectiveness factor (dimensionless)
η', η''	Rate exponents for reactants, products (dimensionless)
θ_r	Radiation temperature (K)
λ	Molecular mean free path (m, nm, ft)
λ	Wavelength (m, nm, Å, ft)
μ	Dynamic viscosity (cP, Pa-s, lb_m/ft-s)
ν	Kinematic viscosity (m^2/s, ft^2/s)
ν', ν''	Stoichiometric coefficients for reactants, products (dimensionless)
ρ	Density (kg/m^3, lb_m/ft^3)
σ	Stefan-Boltzmann constant (5.67×10^8 W/m^2-K^4)
σ	Surface tension (kg/m, dyn/cm, lb_f/ft)
σ_s	Scattering coefficient (m^{-1})
$\bar{\bar{\tau}}$	Stress tensor (Pa, lb_f/ft^2)
τ	Shear stress (Pa, lb_f/ft^2)
τ	Time scale, e.g., τ_c, τ_p, τ_c (s)
τ	Tortuosity, characteristic of pore structure (dimensionless)
ϕ	Equivalence ratio (dimensionless)
ϕ	Thiele modulus (dimensionless)
Ω	Angular velocity; Ω_{ij}, Mean rate of rotation tensor (s^{-1})
ω	Specific dissipation rate (s^{-1})
Ω, Ω'	Solid angle (degrees, radians, gradians)
Ω_D	Diffusion collision integral (dimensionless)
